THE BUILDERS' JOURNAL

AN ARCHITECTURAL REVIEW

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze, for the man, too, who honestly plumbs a jamb. . . .

TALBOT HOUSE

ARUNDEL STREET STRAND

LONDON

CONTENTS.

- ABBEY:** Cistercian, 396; Holyrood, 20; Westminster, 103, 118, 306, 340; Kirkstall, 286

The Builders' Journal.

OURSELVES.

IN the Specimen Issue of "THE BUILDERS' JOURNAL," which was widely circulated through the country, the purpose of the new professional paper was concisely but soundly promulgated. Our promises are fulfilled, and the fulfilment is here before the world of Architecture and Building. Since the Specimen was published, many things have been determined. We print on much better—and much more expensive—paper. Our illustrations are more costly, and come one step nearer to the standard we aim at, and the sixteen pages of letterpress matter, which we give for one penny, is good literature, well handled, and finely printed.

We need hardly seek to emphasize the mode of our introduction. The excellence of our columns commands the support of the professional public, and our modest price—the world subduing PENNY—will take us high upon the crested wave of success into seas hitherto unsailed by the existing professional press. Of that press, or a portion of it, we have the profoundest respect. Its academic profundity inspires a deal of reverence, even if its profundity is too much for the many, and from the North, from the South, from the East and West, a full and unfaltering blast of welcome has poured into the willing ears of "THE BUILDERS' JOURNAL." In the entire ranks of the Architectural profession and of the Building industries, there is a yearning for something more than the existing Building papers give.

It is that, something more, that we supply. Astonishing as it may seem, statistics—which are carefully considered in these offices—prove that 50 % of Architects *alone* are not *purchasers* of any professional journal. What the other 50 %, and what the host of subsidiary professional men—the largest and really the most important to Trade advertisers—do, we don't know. The answer to so pertinent a fact does not lie with us.

But, be it known, clearly and precisely, the details of our existence. We approach every man connected with the glorious art of Building. The Architect first, because every page of us is architecturally disposed. The workers in all the great industries of

panions, is also acceptable to him, a welcome is his, indeed, because we know he can enjoy us at so little cost.

It is impossible, in a first issue, to arrive at a perfected state. Our improvement will be interesting to watch, for, although it is impossible to give what we are giving, say even to 50,000 men for 50,000 pennies, yet it is possible, by such pluck and enterprise, to become the finest medium in England for the announcements of a much divided industry, which, after all, is the foster brother of every atom of *architecture* the world can boast.

And that we are, even now, that finest medium, in all modesty, knowing what we know, we fearlessly assert.

RIPLEY'S OLD ADMIRALTY BUILDINGS. See page 11.

which Building is the whole, because we shall give them, in truth, every point that can in any sense interest them. And the humble toiler for whom in our inmost heart we have an affectionate regard—the honest, clean, artistic-minded craftsman, who toils and spins, and often reaps but a sorry reward—if he can see in our bright and happy pages aught which, being acceptable to more intellectual com-

that they should require the embodiment of the highest aspirations of the land." And then, as if to let us down from such a dizzy altitude, the Professor added—may be in a side whisper, as if he were ashamed of its necessity—"I do not think that these motives are predominant now." Nor do we; but we are improving, without, however, any signs of any great architectural epoch which may be looming in the distant future. One part of the Professor's address interests us deeply. We did not hear it delivered,

Pro. Aitchison at the Royal Academy.

"THE Advancement of Architecture" was the subject of Professor Aitchison's second lecture to the Architectural Students at the Royal Academy, and the date of our own birth, and that alone, debars us the privilege of dealing with it more extensively than we at present are able. The Professor opened his discourse with an assertion that will break the hearts of all those men whose aspirations are as high as his own. He said that architectural advancement is dependent on many influences, two of the most important being these "That the desires of the nation at the time should run in an architectural direction, and

but we can imagine the ring—the full-toned ring of honest advice—with which it entered into the hearts of the students present. We should like to see it printed and presented to the Members of the Architectural Association, so that some of those hairdressers' assistants—if there be any such—of whom Mr. Mountford, the President, spoke in his inaugural address, might see the abyss into which their—shall we say ambition—is leading them. Thus concluded Professor Aitchison:—Let me again recommend to each of you to know yourself, and also to bear in mind the proverb, "All men cannot do everything," and having determined for yourself that you can master architecture, keep at first to those studies only which will enable you to build soundly, without which you cannot be an Architect, to plan conveniently, and to bring your building into the pale of aesthetics, so that it may be decently proportioned, and have some rhythm in it. You will not only make a decent habitation for man to live in, but will bestow on it some of that character and dignity that it behoves every civilised man to require in his dwelling, so that it cannot be mistaken for the den of a wild beast, the shelter for a tame animal, or the hut of a savage. Happily, each branch of architecture is transcendental. You never need fear that you have mastered every branch of the art, or weep, like Alexander, because there are no more worlds to conquer; but when you have mastered the necessary part, there is no reason why you should not try something outside it, which may be called an accomplishment. You must have exercise and recreation for your health, but it is much better for an Architect to be a poor ornamentalist, painter, or sculptor as well, than to have spent twice the time that such a smattering would have taken in learning to knock a ball into a hole with a stick in a close room. Only, recollect this, that with a most exacting profession before you, unless you have abilities of a very rare order, you can hardly expect to be good at your profession and excel in other arts that men have devoted their whole lifetime to master. It is one of the signs of the fascination architecture once had that Brunellescho should have left his sculpture, Bramante and Baldassare Peruzzi their painting to become Architects. I hope that among the students to night there may be a genius who can rival Bacon in the width of his knowledge and the depth of his penetration. Such a man may try to rival the great geniuses of the world, Orcagna, Leon Battista Alberti, Michelangelo, or Leonardo da Vinci, in Italy, who were Mathematicians, Musicians, Poets, Painters, Sculptors, and Architects: Perrault, in France and Wren, in England, are other examples of excellence in various arts. Wren was a scholar, an astronomer, a mathematician, a mechanical inventor, a demonstrator of anatomy, a physiologist, and the pioneer of hypodermic injections, a great constructor, and one of the most prolific Architects that ever lived. Some of his works are beautiful, such as the spire of St. Magnus the Martyr and Bow steeple; St. Paul's is, perhaps, the finest example of the late Renaissance cathedrals, infinitely surpassing St. Peter's in outline and composition. All Wren's plans show a mastery of the art of planning, and some are both original and charming, and all his works have a flavour of the grand style about them. Wren, too, would have been a commanding figure in any of the many arts he learnt or dallied with, but it is the merit of the architecture of his day, that it had the power of attracting to it and absorbing so great and widely gifted a man. As soon as modern architecture can be brought to life again we may look to its attracting some of the greatest men, for, as Aristotle affirmed, it is one of the master arts of the world.

"FROM the gingerbread
Humbug. Gothic of her pretentious build- ings to her ponderous procedure, the 'Mother of Parliaments' is a venerable yet delightful old humbug." That is the second sentence in the first issue of *The Album*, the latest co-operative product of the journalistic stores, over which Sir William Ingram presides. We do not stay to discuss the status of the individual who penned the sentence or of the master mind that passed it, but what, in all humbleness, we wish to suggest to those wholesale dealers in journalistic products, is that they should continue to publish pictures of anything or anybody and leave criticism to those who have the capacity to criticise. Every slut of the stage has been glorified by tricky photography by the firm over which the above-mentioned Baronet has the good fortune to sit. In this particular issue of their stupid work there appears sixteen portraits of sixteen children, possessing sixteen extremely commonplace faces, and the collection is entitled "Our Beautiful Children," all this, in our concrete capacity, we do not object to but when the young bloods of Milford Lane begin to talk Architecture, then we are distinctly justified in interfering. What makes this particular offence more offensive, is the fact that the criticism purports to be the work of a member of the House—we possess our own opinion as to that, and if we be a judge at all, we should say, after reading the whole article, that we do not believe it. If, however, there be a Member of Parliament so utterly devoid of decency and self-respect as to write such rubbish, and to possess such an opinion on what is recognised through Europe as the finest secular building, Architecturally, of the century, then the sooner Sir William Ingram engages a more competent critic, the better for his reputation.

Trades Unions. It is no purpose of this journal to deal with the ramifications of Trades Unions, but an extremely interesting case was in the Courts on Friday last. It was a motion on behalf of Messrs. Trollope & Sons and two of their foremen and six workmen, to restrain the officers of the London Building Trades Federation from publishing a circular headed "Trollope's Black List," which contained the names of workmen who remained in the employ of the Plaintiffs during the continuance of a strike. In October, 1894, Messrs. Trollope entered into a contract for building in Park Lane and Mount Street. On the 24th October, 1894, Messrs. Trollope received a letter from the secretary of the Federation, complaining that Messrs. Trollope had broken an agreement of the 27th June, 1892, whereby master builders had agreed that no workmen should be put under any disability by belonging or not belonging to a Union. The secretary and another member of the Federation then called on Messrs. Trollope and asked them to discharge their two foremen, which they (Messrs. Trollope) refused to do, saying that they and their foremen never made any difference between Union and non-Union men. The Federation then called out all the men of the Union, and 175 men went out. The strike continued until January 14th, when the Union men asked to be taken on again, but Messrs. Trollope in the meantime had filled their places. Subsequently Messrs. Trollope found that a large yellow circular headed "Trollope's Black List," containing the names of workmen in their employ, had been sent to the different lodges of the Federation, and, the Plaintiffs alleged, had been found in the mess room of other workmen. Mr. Justice Kekewich said the question was whether the act complained of was violent or malicious, and intended to do injury to another. His Lordship had no doubt that the Federa-

tion intended their members to be benefited, but that was not the only motive. Without doubt the motive, and the principal motive, was to injure those persons mentioned in the Black List and Messrs. Trollope, who employed them. That was the influencing object of the circular, and was actionable. In his Lordship's opinion, it was clearly a case in which the Court ought to exercise its jurisdiction. All the Plaintiffs were seriously injured in the exercise of their lawful calling, and were interfered with maliciously. It was not right to subject the Plaintiffs to that injury until the trial of the action. He, therefore, granted an injunction until the trial or further order restraining the Federation, their officers, servants, and agents, and the other Defendants by name, from publishing, posting, or issuing the said circular.

We should like, as far as we
A Promise. are able, to define the future programme of *The Builders' Journal*. We would ask our subscribers, first of all, to remember that this, our first number, is likely to be the most imperfect we shall ever publish. It is better to improve than it is to deteriorate, but as to our principal features, we do not intend that "Men who Build," should be an absolutely regular item of our contents, and we want it to be understood—and our intention in this respect has been warmly applauded by perhaps the finest living Artist—that it shall be sufficiently expansive to include any man, be he a member of the Royal Academy, or be he a man who works upon the scaffold, who has done noble work towards the highest conception of building art. We purpose inviting—though until we were in existence, men were chary, as can well be understood, of committing themselves too much—articles or papers from competent men, upon the particular subject they are known to be conversant with. We cannot lay very much stress upon this, because it is one of the peculiarities of professional journalism that non-professional writers have never been known to fulfil their promise of a contribution. However, if our readers appreciate this feature, which we hope they will, we will endeavour to overcome this difficulty. At any rate, we will make the life of the man who promises—and does not fulfil—a perfect burden to him, and perhaps some of our readers who have studied this peculiar development of modern manners, will be willing to offer us a few suggestions. Our chief permanent feature will be "BRICKS AND MORTAR," which, when we have settled down, will contain the cream of comment upon all contemporary matters. We shall discard all profound and academic leaders as beyond our scope. Papers read before Institutions will, in almost every instance, be treated in a special article containing the pith, and the germ without the padding. Our notes on Trade and Commerce will be fearless and without the suspicion of financial motive about them. Our Sawdust will be just what it appears to be, a mass of food without much cooking. Our Tenderings will presently be very full and authentic, and our General Notices, we hope, will not lack interest. From time to time, we shall publish special numbers, if our advertisers are clever enough to make it possible for us to do so. These numbers will consist of a supplement of sixteen pages, dealing with an Artistic or Scientific subject, the first will be published during March, the date will be duly announced, dealing with the exhibits at the forthcoming Builders' Exhibition. If we discover, however, that it is not possible to do this with justice to our motives, we shall not attempt to accent the Exhibition in any way.

A CHAT WITH Mr. PENROSE, M.A., F.R.S.,

President of the Royal Institute of British Architects.

NEXT to Archdeacon Sinclair's charming old house in St. Paul's Churchyard is an insignificant one-story building, upon whose front door the name of Penrose is all but obliterated from the well-worn plate. It is the official address of the Cathedral Surveyor, and thither, whilst the hum of City life is in full tune, you cross over from the beautiful fabric which seems to have an inexhaustible source of inspiration for the man of architectural heart and soul, and seek a moment with the President of the Royal Institute of British Architects. Mr. Penrose has been one of those potent factors in architectural art, whose power ever seems to be present, ever influencing the work of minor men, ever casting its light of love over less able artists, unseen, unheard, almost unknown. If one tried to cast the professional career of such a man, the stepping stones would show out clearly over the flowing waters of its impulse, but there would be none of those monuments on the banks to denote the stopping places of his mind or to trace the growth of his artistic intellect as it expands and pulses with the ordinary man of more work and less worth. Mr. Penrose has possessed a master mind, and he has missed the opportunity of creating material records, and to a man of the highest attainments the one is essential whilst the other is of little moment. Mr. Penrose is not "eaten up" with his own importance. A more mild, humane, retiring man does not live, and so you hear no dramatic history of his life in the few short replies to the queries you are almost ashamed to put to him. He stands at the desk at the rear of the "muddled" office where everything is chaosickled o'er with the pale cast of dust, and age. A plaster model of the dome, plaster models of other portions of the fabric, wooden sections, detail sections, and large scale plans and elevations of every atom of the Cathedral lay hung about the dim religious place in which the light of day filters through dusty windows weeping for the sacreligious mass of humanity passing to and fro on the pavement outside.

In keeping with the character of his surroundings, Mr. Penrose stands with clasped hands waiting for your questions with the resignation of a saint awaiting his doom. The extremely classic face, far more severe in its features than anything Wren ever created, has lines of deep thought running over it, and behind the glasses which he habitually wears, the eyes are closed the while he dips into the details of the past, and with consummate art parries every attempt to draw him on the decorative questions of the Cathedral.

"I was born in 1836; was articled to Edward Blore; spent twelve months in Messrs. Cubitt's workshops; went to Cambridge, took my M.A. degree; travelled for three years in Italy and Greece and less important European countries; came back and started in practice."

Mr. Penrose is not given to over elaboration of detail.

"And then?"

"Well! practised, principally in the country, built two and restored many churches, and in London did nothing of greater importance than the Choir School in Carter Lane opposite."

"And of the Cathedral?"

"Oh! I followed Professor Cockerell, of course."

"Elected!"

"Appointed by the Archbishop of Canterbury, the Bishop of London, and the Lord Mayor."

"Of the decorative—"

"Pardon me! I have nothing to do with the decorative scheme of the Cathedral; Mr. Richmond, the associate of the Academy, has been appointed to superintend the work. Mine is to watch the fabric of the Cathedral and keep that in preservation."

"But who advised the gilding of the iron railings under the dome?"

"Ah! that is stopped. It was not good, and it took the eye away from Steven's mosaics in the pendentives."

"Which, Mr. Penrose, you have always approved of?"

"Yes, they are very beautiful and in the position where colour was most wanted."

"You have no opinion to offer on the reredos erected some years back?"

"None. It was Messrs. Bodley & Garner's work, and of its kind extremely fine."

"You have never discovered any alarming deterioration in the stability of any part of the Cathedral?"

"You love the Cathedral, Mr Penrose?"

"Yes. It is in my opinion the greatest classic exterior in the world. St. Peter's has no doubt a nobler interior, but there is nothing known to Europeans which quite comes up to the external grandeur of St. Paul's. Its front is beautiful beyond any conception."

"You are the year's President of the Royal Institute, Mr. Penrose?"

"Yes! the Council asked me if I would fill the chair, and I accepted."

And at this sublime height of modesty it would have been painful to have proceeded further, so you accepted the pleasing smile, modest also in its fervour, the kindly shake of the hand, and the good wish that accompanied it, and as you closed the dusty door of the dusty "Chapter House" behind you, you deemed it unnecessary further to extol the virtue of a man who has so silently, but so surely, made his mark upon the Architectural history of his time.

A FINE INTERIOR.

INTERNALLY the most beautiful house in London is unquestionably

Mrs. Mackay's town mansion in Carlton House Terrace. Some few years back, when Mr. Charles Sandford called in Messrs. Ernest George and Peto to advise him as to the embellishments of his house, he gave them absolute discretion and an expenditure which was positively to be unlimited, and those who have seen the result of this somewhat unique commission do not doubt that Ernest George put every atom of his soul into the work. The entrance hall, 38 feet by 25 feet, is entirely lined with marble, the panels of which are pink Soudanese, divided by statuary pilasters, carved into fine renaissance detail. The pavement is of the choicest marble, the ceiling of blue and gold gessowork, and the chimney piece in the Italian style of the fifteenth century, and the carved frieze, 3 feet deep, are the work of George Frampton. The dining-room is panelled in mahogany up to the ceiling, with a deep frieze of carved panels, partly gilt in the style of Henry II., the margins of the lower panels being inlaid with satin wood; the ceiling has wood coffers, with the whole central portion domed and decorated with finely modelled figures in ivory colour on a gold ground. The drawing-room is superb in the Palladian style of the Italian sixteenth century; the ceiling has its panels filled in with paintings and the walls divided

with pilasters, the wall panels being filled with grey and gold brocade. The library is dado-panelled in Italian walnut, "filled in" with gilded leather, the ceiling being of inlaid walnut coffered work, the panels and frames being inlaid with boxwood. Indeed, so luxurious is the entire house that the ceiling of the grand staircase is coffered with wood and gessowork in blue and gold, the coffers themselves being filled with star-shaped flowers, the petals of which are carved from mother o' pearl, and the two bath-rooms are lined with luxurious marble, one in the Pompeian style and the other Japanese, with representations of pomegranates, orange trees, lotus plants, fishes and storks. It is but just to remark that Messrs. Collinson and Lock, the existing Oxford Street firm, devoted the utmost care to the execution of the decorative and marble work under the personal supervision of the architect.

THE town council of Crewe propose erecting a school of art and technical institute at a cost of £3,000.

WEST FRONT OF ST. PAUL'S.

"None whatever. The New City Underground Railway Company wanted to construct a Station at the corner of the Churchyard, but we strenuously opposed it, and the House of Lords' Committee very wisely upheld our opposition. Although the 'tube' will run very close to the foundations there is not the slightest fear of any damage being caused by that."

Smilingly, you ask Mr. Penrose if he ever had the intention of washing the outside of the Cathedral?

"The question is too ridiculous to answer," is his reply, "the sooty coating only forms on those parts not exposed to the weather, so that were there any virtue in the washing suggestion, a few months would bring back the old condition of things."

"And, even if such a thing were advisable, the contract would be an extremely heavy one."

"We have no contracts now! It is some years since any work to the Cathedral was not done by our own staff of workmen."

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
12th February, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

I DROPPED upon this aphorism in this way. Wanting a foundation stone upon which to build this weekly batch of BRICKS AND MORTAR I had ransacked the recesses of my brain, and my stock of reference works to find one, and none would suit. It is a dangerous occupation this quotation hunting, for what is sauce for the goose is not always sauce for her gentleman friend, and the more I struggled to discover something fresh and telling, the more unconsciously I was drifting to the *Seven Lamps* burning as brightly as they did some five and forty years ago.

It was at Brocket Hall, Lord Mount Stephen's delightful home in Hertfordshire, that I struck oil; and I was sitting in the library, in the room and in the very corner where Lord Palmerston died. After turning over a number of volumes I came across the 1880 edition of Ruskin's famous work, and on the page at which the book opened—a page under the "Lamp of Sacrifice"—there, in big, bold type, appeared the paragraph I have quoted. A cold perspiration came over me as I read it. "I

am no advocate for meanness of private habitation," are the words of the sage. "I would fain introduce into it all magnificence, care and beauty where they are possible; but I would not have that useless expense in unnoticed fineries or formalities; corning of ceilings and graining of doors, and fringing of curtains, and thousands such; things which have become foolishly and apathetically habitual—things on whose common appliance hang whole trades, to which there never yet belonged the blessing of giving one ray of real pleasure, or becoming of the remotest or most contemptible use—things which cause half the expense of life, and destroy more than half its comfort, manliness, respectability, freshness and facility."

MOSAIC FROM THE GREEK CHURCH,
BAYSWATER.

I HAD been visiting during the day several cottages on the estate—"with a deal floor and roof, and a hearth of mica slate"—and I glanced round the beautiful room in which I was then standing, and wandering back through the luxurious saloon, through the most "sublime" morning room I had ever seen, up the glorious central staircase and through the Japanese and French suites, I heaved a heavy sigh of remorse and inwardly blessed "the unnoticed fineries and formalities; corning of ceilings and graining of doors, and fringing of curtains and thousands such," and for the honour and glory of English architecture I wondered what our homes would be without them. But I chose the professor's words as the foundation stone of these paragraphs, because they show how sublime must be his soul, and how fast the world moves on to its artistic degradation. One wonders what "Brantwood," on the Cumberland hills, is like, and why it should be filled with Turner's marvellous works, his daring, his wondrous detail, his profligacy of colour, and his grandeur, when the great teacher is so simple in his desires. And rich marble churches! like dust drops upon the map of Europe for the lowly-minded men who live between deal floor and roof and a hearth of mica slate.

BUT Ruskin does not mean to be taken literally. He slashes at the cheap and nasty detail, the hideous mouldings, the wretched carvings, the sham marbles, the filthy grainings, and such like horrors of our homes. And truly we should be wise to heed his words, to abolish from the puny habitations most of us frequent the over-wrought, over-balanced detail, and fussy richness, and in their places give simplicity and grace and truthfulness. And, therefore, the *Lamp of Sacrifice*,—of all its sister lights shall be the motto of the house I herewith build, yet architects and builders, craftsmen and workers in the greatest industry of mankind, dare not hope to live anywhere near the ideals of John Ruskin. The tide of mediocrity is too strong. But the world is the richer, and architecture, what we possess of it, is the healthier for his teachings, and as far as it is able with propriety to do it, the *Builders' Journal* enrolls them in its creed.

THE EDITOR.

PROF. ROGER SMITH, of University College, —the Professor, by the way, must be getting into the sere and yellow leaf, for he was past the meridian when I knew him, a number of years ago—has a very excellent method, and knows as much about the "Practice" of Architecture, as any man in London. He does not, I believe, hold a very high position for his artistic qualities, and has but little liking for anything that takes design away from the fundamental principles of the recognised "Styles," but he is a stickler for professional etiquette, and an arbitrator of much repute. The Professor is guilty of an excellent story, which he religiously imparts to his classes every year. A certain engineer constructing a new railway, specified that the concrete material should be even in size, and of nothing larger than what could be got into a man's mouth. The contractor being a bit of a wag, kept to the letter of his contract, and was never seen on the works unless accompanied by a stalwart nigger, six feet or more, in his stockings. The engineer was perplexed by the presence of this man whenever he met the contractor on the works, and one day he asked his subordinate what the devil he wanted a blackie always hanging on to his coat-tails. The contractor with a very serious expression on his face, approached the specification writer, and in bated breath, begged him to be careful what he was saying, for the nigger was no less a personage than the concrete gauge.

THE Sunday evening lectures, at Toynbee Hall, on our English cathedrals have been resumed. At the initial lecture the Rev. J. W. Tait told the story of Salisbury Cathedral, first taking his hearers back to Old Sarum and its cathedral within a fortress, a witness of the close association between ecclesiastical and military power, and then on to the building of the new cathedral in the valley, the first stone of which was laid by Bishop Poore, in 1220. The population followed it, and a new city grew around the new temple. In 1540 there were no people left in Old Sarum, yet it continued to exist as a borough, and in 1831 eleven electors returned two Members to Parliament, when Birmingham did not return one. Dean Stanley had said: "Salisbury is all glorious without, and Westminster is all glorious within." Henry III. was said to have determined on the rebuilding of Westminster through the influence of Salisbury. It was the earliest church in the new Pointed style, of which it still remains the most perfect example.

MOSAIC FROM THE GREEK CHURCH,
BAYSWATER.

ITS greatest feature is its spire. Salisbury is the only completely homogeneous cathedral in England, and it is, moreover, purely an English cathedral. It is an example of Early English in its simplest, purest form, and Early English is more national than the Norman architecture which preceded it, or the Decorated which followed it. There is no strong emphasis in Salisbury Cathedral. It was not the conception of any individual, but of English art in the first half of the thirteenth century. It has the beauty of grace rather than that of power. "Divinely tall, and how divinely fair," it was feminine in its loveliness. It is distinguished in the perfect harmony of its surroundings. It is set in one of the greenest and fairest of earth's spots, described by the late Oliver Wendell Holmes as "the apple of the eye of all England;" it seems to have grown as naturally from the grass as the great elms themselves. The tower groups and assorts with the body of the edifice, just as a full-blown rose assorts with its sister buds, and the quiet and dignity that broods over the great church, broods also over the close and the dwellings of its ministrants. Put Salisbury Cathedral on a hill like Lincoln, or in the midst of a close-built Continental town, and it would look out of place. The interior is less satisfying than the exterior. The architect Wyatt wrought havoc here in the last century. He threw the ancient glass by cartloads into a ditch, and consequently there is too much hard, white glare. The lecturer, showing a view of Stonehenge, remarked that between Stonehenge and Salisbury Cathedral, were all the steps of architecture. The one was a triumph of rude energy, or brute force; the lofty beauty of the other was a triumph of science, which reared the stones and kept them in their place.

London has gone mad, for the moment, over Photographic Albums. Mr. Stoddart, the American, came over with a portfolio of wonderful photographs of the world's most interesting places, and straightway flooded

the land with them. So well and so carefully was this done that the returns have proved a perfect gold mine to the lucky individual, and £60,000 is the profitable result of his labour. The second series of twelve portfolios, each of sixteen views of "Beautiful Britain," has just been completed, and every lover of the beautiful should hasten to procure a set; for anything more superbly printed has never been seen this side of the Atlantic. The lovely views of Longleat, of Welbeck, Audley End, Hatfield House, and of a dozen more of the grandest piles in the country eclipse anything ever seen in photographic reproduction.

Compare these with a wretched publication called "The Album," a journal of photographs of men, women and the events of the day; the first number of which is on our table. Amongst other photographic illustrations therein is an interior of Westminster Hall, which is disgracefully executed, evidently from a very ancient negative. Blind followers of the photographic art must learn the failings as well as the triumphs of the camera, and that where large masses of deep shadow occur in a "view," such as in the sacred precincts of Westminster Hall, the steel engraver alone can approach fidelity of reproduction, and, unfortunately, the Americans are centuries ahead of us in the art of printing.

THE MOSAICS from the Greek Church at Bayswater, which are scattered through this number, and will be continued in subsequent issues, are of the twelve apostles, and form—together with the central figure of Christ in the dome—the finest specimen of mosaic decoration in the kingdom. It is impossible even by the aid of photography to give the slightest conception of the grandeur of this work. The figures, apart from the pedestals on which their names are inscribed, are 30 feet in height. Mr. G. M. Mecenero was the Artist of these panels, and we believe the entire cost was defrayed by a member of the congregation. Although it is two years since this fine piece of decorative work was completed, we have no knowledge of its previous publication, which we are happy to think is well worthy of it.

MR. LIVESEY, the great authority on coal gas, and the head worker of the largest gas company in the world, has been lecturing to the students of the Goldsmiths' Institute on "Gas Manufacture," and from his lecture, upon which we commented in our specimen, many interesting facts are obtainable. Coal gas was first used for lighting purposes in 1797. The first undertaking to supply London with gas was by the National Light and Heat Company, formed in 1806. Others rapidly followed, and the competition at last "became intolerable." Five competing companies, sometimes, would have five different mains in the same street! In Walworth Road, in 1853, there were eight mains; now there are but two. In 1853, the five companies that served the Metropolis south of the Thames, agreed to parcel the districts into convenient areas, each company getting a compact district instead of one straggling, so to speak, from Dan to Beersheba. In 1860, the north of Thames companies did the same, and from then till now competition has gradually narrowed to a minimum all over the kingdom. In 1850, there were fifteen distinct companies in London; now there are but three. To pay a dividend of as much as 5 per cent. was quite uncommon. Meters were not introduced till 1820. The price of gas has fallen steadily since its introduction. A thousand cubic feet cost in London 15s. in 1820, 12s. in 1832, 8s. in 1843, 6s. in 1848, 5s. in 1850, 4s. 6d. in 1853, 4s. in 1862, and 2s. 4d. (in South London) to-day. The price of labour has about doubled in the last three-quarters

or a century. In 1843, at the Kent Road Works, 7,744 tons of coal were used in producing 72,000,000 cubic feet of gas; in 1893, the coal used was 176,000 tons, and the gas got from it was 1,784,000,000 cubic feet; from which it can be calculated that a ton of coal yields 10,000 odd cubic feet of gas.

THE two Halifax architects, Messrs. Joseph and John Leeming, whose Admiralty work is illustrated on another page, have had a very eventful career since they won the competition which

MR. JOSEPH LEEMING.

or late Elizabethan—of which their new Grammar School of Queen Elizabeth at Heath, Halifax, is a good example; their inmost feeling was classic, and steadily they plodded through competition after competition with varying success, and carried out many important local works. In 1881 they felt their feet a bit when they won a premium in the important competition for the Glasgow Municipal Buildings, and then, two years later, they entered luckily upon what proved to them the foundation of their success. That they accomplished their object is now history, and, in the words of the distinguished architect of the National Portrait Gallery, speaking as the then President of the R.I.B.A., "It is little short of wonderful that whatever its faults of detail may be, so fine a plan and so good an elevation should have been entirely wrought out by men, solitary students in a provincial town, with no special advantages, untravelled, unknown to the world of art, and who have produced drawings of the most remarkable delicacy, which may have been equalled, but never to my knowledge, surpassed for perfect execution; that such drawings as those submitted in each competition should have been prepared in so short a time, as I understand, by two men and a youth working together without extraneous assistance, excepting as regards perspective and figure drawings, whatever else may be said, is undoubtedly a very remarkable example of that 'well directed labour' to which, as the first great President of the Royal Academy said, nothing is denied."

MR. JOHN LEEMING.

THE opposition which the Institute offered to the scheme, and which was backed up very strongly by a professional contemporary, is also history of an ancient type. The opposition succeeded, and the scheme, as it originated, was finally abandoned, and the piecemeal policy, of which the first fruits have just blossomed into ripeness, was the outcome. The objection to the second method of dealing with the great needs of the Admiralty and War departments was that it would be dangerous to erect any very heavy structure in proximity to the old Admiralty buildings. The objection was, however, unnoticed, and there are no signs that, as far as the work has at present proceeded, any fear need be shown that anything of the kind will happen.

MESSRS. LEEMING of course came to London when their rising star drew them thither, and prospered. They gained the first premium in the Edinburgh Municipal Buildings Competition and the second in the Lisbon Post and Telegraph Offices, and they won the competition for the Halifax improvements, comprising arcades, shops, markets, &c., which they are now carrying out at a cost of close on £70,000. Whatever faults may be found in a keen critical survey of their work, there is an unpretentious charm about it, which is not always so readily noticed in the work of their artistic superiors. The Yorkshire grit and stability seem to pervade their artistic methods, and although they have not yet given us any great work, we seem to detect a well-intentioned energy, which will take them very near it.

THIS is hardly the place to go into a deep dissection of the life of Sir Richard Tangye, head of the famous firm of engineers, but a few interesting details cropping up in a contemporary calls one to review the facts of a remarkable career, perhaps more remarkable than those which governed the rising of Lord Armstrong. Five Cornish lads, working together upon their father's little farm, developed a remarkable skill for mechanics. They made working models of engines at home in the winter evenings, while their father looked on dubiously, and lamented the waste of candles. But the mother, with keener perception, recognised the bent of her sons' minds and encouraged it. Truly the candles were not wasted. The fourth brother, now Sir Richard, being physically weaker than the others, was educated for a teacher. Disliking the occupation, however, he abandoned school-teaching at the age of eighteen to seek his fortune in Birmingham, taking a situation as clerk in a small engineering establishment, at a salary of fifty pounds a year. After three years and a-half, during which time his salary had been raised to eighty pounds, he determined to start in business for himself as a merchant, his old friend, Mr. Alderman White, of Birmingham, giving him office-room in his place of business.

MEANTIME, he had persuaded his two elder brothers, skilled mechanics, to come from Cornwall and join him. Together they planned and started a business as machine-makers, renting a workshop at four shillings a week in a back street, behind a baker's shop. One dark night to their little shop came an agent of Brunel, the engineer. He had heard that "Tangyes" had invented and were manufacturing an hydraulic jack, which he thought might be of use in launching the Great Eastern. Needless to say, he scarcely expected to find what he wanted when he saw the insignificant workshop. But he was soon reassured; the hydraulic jack was produced, and arrangements were quickly made for setting about the famous launch. This order for hydraulic jacks proved to be the

real foundation of the business. As Sir Richard tersely puts it, "We launched the Great Eastern and the Great Eastern launched us."

With improved business prospects the brothers took a larger workshop, at ten shillings a week, and ventured to engage their first workman, with thecaution that they could only guarantee him three months' work. He is, however, still in their service.

By 1859 the business had increased so greatly that new premises were taken in Clement Street, Birmingham, and finally the world-famed Cornwall Works, the largest engineering works in the world, were erected at Smethwick.

As a recognition of his services to education in Birmingham, Richard Tange was knighted a few months ago, about the

MOAIC FROM THE GREEK CHURCH, BAYSWATER.

same time that a fellow workman, T. Salter Pyne, received a similar honour for services rendered to Sir Mortimer Durand on his celebrated mission to the Ameer of Afghanistan. Sir Richard has a very fine Cromwell collection. "I fell in love with Oliver," says the great engineer, "when I was a little boy six or seven years old, because I had early suffered from the intolerance and persecution of the Church. My parents were the only Quakers in the parish, and of course refused to pay the Church rates. Regularly the parson distrained upon their goods. I saw the cow taken, and in consequence lost my bread and milk for breakfast. Another time the pig was seized, and I and my brothers were deprived of the only kind of meat which our hard working parents could afford to give us. Well, you see, I was touched to my stomach, and had a very powerful reason for hating the Church. When I read a book about Cromwell, and how he upset the Church, I thought, 'That is the man for me,' and he became my hero straight away."

The following paragraph appeared in our Specimen Issue, but the matter is so important that we gladly repeat it here:—

"A Report on granite paving by Mr. Wike, the City Surveyor of Sheffield, gives some useful information as the result of observations on the use of granite setts for street paving. The general conclusions to be drawn from the report—says the *Builder*—are in favour of granite paving. It is shown that of a good many accidents from horses falling attributed to the slippery quality of the granite paving, a considerable proportion did not really take place on the granite paving, and that the reports were consequently misleading and exaggerated. In the course of Mr. Wike's report, the following points are urged. In the case of tramway streets, the tramway company, who have to maintain a width of 16 ft. in the centre of the street, would object to keep in repair any material less durable than granite, as it would entail on them additional expense. A

schedule is given of information supplied by the Surveyors of twenty-nine towns in England in which granite pavement is largely used. The observations of these Surveyors as to the durability of granite paving are very striking. The Glasgow Surveyor says "40 years and another 30 after redressing;" Sunderland, "43 years, and then can be taken up and laid elsewhere;" Dublin, "30 years; still in fair condition;" Bury, paving down 8 years, and not a penny spent; say 30 years, then redressed, and 20 years more." Most of the reports are to a similar effect. In Sheffield the granite streets recently laid have been in very flat sections. From various indications in the report, it appears that the chief danger of falls for horses is at the side portions of the streets where the section is rather rounded. The roads laid with "Gritstone" compare with granite very unfavourably as to wear and ultimate cost. The "Gritstone" pavement in High Street, Sheffield, was laid in 1891, cost 10s. 6d. per yard, has been occasionally repaired, and will soon have to be relaid. Some of the gritsetts taken up in 1891 had worn from 10 in. to 4 in. or 5 in. thick; but the time they had been down is not stated. The gritstone laid down in 1891 was not on concrete, but the Surveyor states as his experience that the gritstone pavement wears as quick, if not quicker, on concrete, as on an ordinary foundation. In regard to the life of paving materials, Mr. Wike estimates granite as 20 to 30 years with few repairs, gritstone 3 to 8 years, wood (deal) 5 to 7 years. This is on streets not subject to traction-engine traffic. The comparative cost of wood and granite paving as computed by the City of Manchester, is given as follows:—

WOOD, AVERAGE LIFE, 15 YEARS.	GRANITE, AVERAGE LIFE 30 YEARS.
Initial cost s. d. 14 6	Initial cost s. d. 10 6
Cost of taking up, cleaning and re-paving blocks once during lifetime ... 4 3	Cost of repairs, 30 years, at 3d. per yard 1 3
Cost of ordinary repairs, 15 years at 3d. per yard 0 3½	DEDUCT— s. d. 11 9
DEDUCT value of concrete foundation 19 0½	a. Value of foundation 1 0
Total cost for 15 years 17 0½	b. Value of old setts at time of renewal 3 4½
Average cost for one year say, 1s. 1½d.	Total cost for 30 years 7 4½
	Average cost for one year, say 3d.

It is admitted that granite becomes slippery without constant cleansing. The Paving and Highways Department of Manchester reports that granite pavements have been used for fifty years in their principal streets, "and have answered well when the streets have been properly cleansed, watered, and sanded." In regard to the sanding, it appears from other information included in the report that liberal sanding is much desired by horse-owners, and is always effectual in removing slipperiness, but that it becomes a nuisance to shopkeepers from the sand blowing about. In Manchester, wood-paving is being adopted solely on account of its comparatively noiseless character; it is considered to have no other advantage. The Manchester Paving Department, however, reports that crossings in a particular district paved with small 4 in. granite cubes, were found to be much more slippery than the larger setts.

In the course of his third and concluding lecture at the Royal Institution on "Stained Glass Windows and Painted Glass," Mr. Lewis F. Day dealt with the influence of Renaissance art. He said that concurrently with the later Gothic manner, which lasted until about 1530, there flourished a newer phase of art—the Renaissance. So far, how-

ever, from there being any marked deviating line between Gothic and Renaissance glass, it was often only by the character of some slight ornamental or architectural detail that

MOAIC FROM THE GREEK CHURCH, BAYSWATER.

one could determine in which category a window of the early part of the sixteenth century should be classified. The fact was the Gothic influenced the glass painters almost as long as good work continued to be done, and it might almost be said that with these Gothic conditions in glass painting were inspired by the new enthusiasm. Having dealt with the "Jesse" windows, Mr. Day said that the donor of a window was always a most important person. In early days, however, he was content to efface himself, or at most to appear in miniature and quite modestly in the corner of a window. But in the sixteenth century he was very much *en evidence*, and no scruple would restrain him from putting in an appearance in the very midst of a most sacred subject. Yet the vainglory of such men resulted in the production of works of such consummate art that we in our generation could only be grateful to them. The lecturer concluded with a consideration of the decline of glass design and the characteristics of seventeenth-century windows.

A LARGE number of experiments, says a contemporary, have been lately conducted to determine the adhesion between various cement-mortars and makes of brick. Five kinds of brick were subjected to the test. 1, Hard, well-burnt, machine-made, and repressed bricks, having well-finished surfaces; 2, soft machine-made bricks, used for facing; 3, hard clamp-burnt hand-made bricks; 4, hand-made facing-bricks, softer and weaker; 5, sun-burnt bricks, used for foundations. The cements were:—1, a slow-setting Portland; 2, a quick-setting Portland; 3, a slow-setting slag cement; 4, a moderately slow-setting slag cement; 5, another make of slow-setting cement. Three kinds of mortar were made with each cement. First, 1 part cement to ½ part sand; second, 1 part cement, 1 part sand; third, 1 of cement to 2 of sand. The bricks were carefully cemented together, before which they were soaked in water, and after setting, their adhesion was tested at various dates. From the mean of the experiments, which were repeated four times in each case, it was ascertained that the smooth pressed brick gave a far better hold to the mortar than the rougher varieties—a result unexpected. The table of results show many irregularities. The highest result is for a machine-made repressed hard brick with quick-setting Portland (1 part cement, 1 part sand), which give at 44 days an adherence in pounds per square inch of 106.7 lb., more than 50 per cent. greater than the other results in the same column, showing the greater adhesion of quick-setting Portland of the above proportion to the slower-setting cement.

GAS tight piping, which is at the same time much lighter and less expensive than metal, and very durable, is now being made in America. Strips of Manilla paper, having a width equal to the length of the required tube, are saturated by passing them through melted asphalt, they are then rolled round a metal rod until the proper thickness has been reached. Rolling pressure between two flat surfaces is next applied to consolidate the layers of paper, and after that the metal core is removed, and a coat of waterproof composition is put on outside the pipe.

COMMENT has not altogether ceased about the Commandership of the Bath that was conferred upon Mr. John Wolfe Barry, the engineer, after the completion of the Tower Bridge. But perhaps he glanced through the lists of City Knights, and thanked heaven the honours of such a Knighthood had been withheld from him. Mr. Barry is a veteran in his profession, a man of close on sixty years of age, and the constructor among other things of such an important engineering work as the Barry Docks at Cardiff. Mr. Wolfe Barry's professional inclinations are hereditary. He is the youngest son of the late Sir Charles Barry, the architect of the Houses of Parliament and of some of the most stately buildings in London—the Reform Club, the Travellers' Club, and the College of Surgeons. His first introduction to the class of work for which he has attained much eminence was when he entered the employment of Messrs. Lucas Brothers, the railway contractors. He then became articled to the famous civil engineer, Sir John Hawkshaw, under whom he acted as resident engineer during the construction of Cannon Street and Charing Cross Stations and Bridges. Just over a quarter of a century ago, Mr. Barry commenced practice, and he has since been entrusted with many railway works of great importance, the most recent being the supplemental bridge connecting St. Paul's Station with the London Chatham & Dover Company's line on the south side of the river. Mr. Barry, who has been a member of several Royal Commissions, has found time to lecture and to write books on railway matters. The eminent engineer's eldest brother is Mr. Charles Barry, past President of the R.I.B.A., and the architect who has fruitlessly endeavoured to obtain the completion of his father's plans for the palace at Westminster.

THIS Country has not yet realised with what rapidity the cultivated land in Great Britain is being laid down in permanent pasture. We have over 16,000,000 acres growing nothing but grass, the partial food of horses, cows and sheep. The rate of increase is about 100,000 acres per annum, and what is the moral? In 1891, when the census was taken, there were 74,000 fewer labourers on the land than in 1881. What this means is too evident to want any deep explanation, and what it will eventually lead to in the congested towns and cities, where the labour market is so overcrowded, no one dares to conjecture. Goldsmith's lines are as true as ever:—

"Ill fares the land, to hastening ills a prey,
Where wealth accumulates and men decay.
Princes and lords may flourish or may fade,
A breath can make them as a breath hath made.
But a bold peasantry, their country's pride,
When once destroyed can never be supplied."

THE Japanese are a nation of carpenters, and with them carpentry is a fine art. In the major constructive arts, the wooden temples and houses, in which the genius of the race for simplicity and thoroughness is most prominent, are fitted together in the highest form of constructive science, however unpretentious their uses may be. The ordinary bamboo fan is a notable instance of the successful way in which the Japanese have combined the maximum of

utility with the maximum of simplicity. Taking as a first hint the natural palm leaf, which is not readily obtainable in Japan, and the addition of a flat surface of paper, they contrived the most flexible, indestructible and economic fan ever invented, which is withal built up on graceful, simple and true constructive lines. The Japanese umbrella is a similar instance, and the original idea was doubtless borrowed from China, but how far superior in finish and taste is the Japanese development? And then the art of the lacquer worker is so intimately associated in our language with the word "Japan," that it has become synonymous with a specific glossy varnish; and yet the process was borrowed from the Chinaman. But the comparison of an ordinary Japanese lacquer tray, with the lacquer productions of the Chinese, at once demonstrates that it has practically become a new invention with the Japs. In Chinese ware there is an opaque surface, generally ornamented with rigid, finicking, monotonous detail, whilst in Japanese specimens there is a translucent surface, combined with freedom and spirit in the decorative treatment, and, as a prosaic matter of fact, far greater durability. But the higher branch of Japanese lacquerer's art which has produced the *lacquer de luxe*, an art combining the most marvellous variety in technical combination with incredible thoroughness in manipulative finish, is beyond the possibility of any comparison whatever.

AND now if our readers will kindly attend more carefully, the Editor would like to speak to them. Our Telephone Number is 35,422, and the sentiments, quite of a personal character, which he is whispering over the wires is of as much interest to them as to us:—

I wish to ask every man to whom a copy of this paper is sent to consider the motive of its production. It has been considered from statistics and facts which we have been careful to collect, that there is an enormous want amongst us for a paper of the character and price of *The Builders' Journal*. There our motive begins and there our motive ends. Each single copy of the *Journal* costs us more than the sum we obtain for it, but this much is said for every journal in existence that is worth its salt. This means a very large sale, and a very large sale means a very powerful medium for our worthy friends who make use of our green-tinted pages. That is logic, unextenuated, and without untruth. But with those good friends I have nothing whatever to do, except to wish them a very happy and a very prosperous connection with *The Builders' Journal*. And now for my last word, if the horrors of the Telephone have not exhausted your patience. Having considered our motive, and approved of it, there are only two possible ways of admiring our pluck and recompensing us for our labour, that is, to send our Manager, to-morrow morning, a Postal Order for three shillings and three pence, enclosed in an envelope with your name and address. You need not even

CORNER OF BARNARD'S INN.

take the trouble to say why you do it, he will know all about that; you will then find every Tuesday morning, lying on your breakfast table, a copy of our *Journal*. Or, if you prefer it, walk round to-night to the book-stall at your railway station, or to the newsagent of whom you regularly deal, and ask him to deliver you a copy every Tuesday afternoon: by this method you obtain the six months' issues for the enormous expenditure of two shillings. Having done that, show this copy, or talk about this copy, to every man you know who will be interested, and depend upon it, that for so trivial, but for so acceptable a service, we shall render you a reward, full and overbrimming in good measure.

SAWDUST.

THE labour dispute in the Douglas, Isle of Man, Building trade, has been amicably settled. The plasterers, who demanded 34s. a week instead of 30s., have accepted 32s. The labourers, who demanded 24s. in lieu of 21s., have accepted 22s. 6d. This agreement is to last for three months.

MR. F. N. MUNDY, of Markeaton Hall, has offered to give to the town of Derby 8½ acres of land, situate between the Ashbourne and Kedleston Roads, and estimated to be worth £8,000, for the purposes of a public recreation ground, subject to certain conditions, including the making of a new street across this land from Markeaton Street to Watson Street. The expenditure which the town will have to incur if Mr. Mundy's offer is accepted has been estimated by the borough surveyor at £8,585.

AUTHORITY has been given to the Bray Commissioners in Ireland to promote a Bill in Parliament for the purpose of raising £38,000. Of that sum £20,000 will be devoted to the completion of the harbour, £6,000 for the purchase of the electric light works and plant at Bray, and £12,000 for sewers, sea-wall, baths, shelter, opening new roads and concreting footpaths.

An inquiry has been held at Nelson relative to a proposed loan respecting £30,000 for works of private and street improvements, £8,000 for sewerage and sewage disposal, £1,641 for a bridge in Leeds Road, and £1,500 for the completion of the Town Hall.

ANNOUNCEMENTS.

Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

THE EDITOR does not hold himself responsible for the opinions of Correspondents, whose communications should be brief and plainly written on one side of the paper.

THE BUILDERS' JOURNAL goes to press on Monday at 6 p.m. All matter must reach the Editor by the first post on Friday morning to ensure its treatment in the current issue.

Publishing.

The terms for free post Subscription to any part of the United Kingdom is SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments. Subscribers in London or the Suburbs receive their copies by the first post delivery on the day of publication.

Advertising.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS WANTED.

Per line (about 10 words), Sixpence.
Minimum charge, Eighteenpence.
Three Insertions for the price of Two.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE AND GENERAL ADVERTISEMENTS.

Four lines (about 40 words), Three Shillings.

Each additional line, Sixpence.

Prepayment in the above Advertisements is absolutely necessary.

The charge for Paragraph Advertisements on the Front Page is Fifteen Shillings an inch, single column. Minimum charge, Five Shillings. Paragraph Advertisements on ordinary page, single column, Seven Shillings and Sixpence per inch.

MANUFACTURERS' ANNOUNCEMENTS ON ORDINARY PAGES.

Per Page, Single Insertion, Eight Guineas.

Discounts for series on application to the Manager, who will make Special Contracts for Announcements on Back and Leader Pages and positions facing matter.

NOTICE.—Advertisements for current week's issue are received up to last post on Saturday. Alterations in standing Advertisements must be made before 6 p.m. on Fridays.

Advertisers in THE BUILDERS' JOURNAL may have their replies addressed to the Manager's Office, free of charge, and may have them forwarded if addressed envelopes sufficiently stamped are sent.

Reading Cases, lettered in gold, may be had from the Manager. Price, One Shilling.

THE Town Council of Leicester have decided to build an Art and Technical School, at a cost of about £25,000, on a site belonging to the Borough.

A NEW Vicarage, by Mr. J. Beynon, Architect, is to be erected at Stoneaston, near Bath.

MR. R. H. BICKNELL, C.E., of Lincoln, has issued a supplementary report as to the best means of draining the town of Stamford. He estimates the cost of putting in the connections with the public streets will be £4,000 in addition to the estimate already furnished for laying the main drains.

The Builders' Journal.

MEN WHO BUILD.

No. I.

SIR ARTHUR BLOMFIELD, A.R.A.

It is opportune indeed that the Architect of the Church House in Dean's Yard, which the Young Members of the A.A. recently surveyed for purposes of study, should be the son of a Bishop, and a tower of strength in his profession. The name of Blomfield is going to linger in the world of Architecture, for although Sir Arthur is the foundation of its greatness, there are others who are following closely and reputably in the same groove. As becomes a son of Dr. Blomfield, Bishop of London, and a man who first saw the daylight from the venerable precincts of Fulham Palace, Arthur Blomfield was sent to Rugby and finally found his way to Trinity College, Cambridge, where in 1851, at the age of two and twenty, he took his B.A. degree, and his Mastership four years later. There was no dalliance when his future career had to be considered, no back door into a snug little rectorship was going to be opened for the fourth son of his "Right Reverend" father, diplomacy was not to be played with, idleness was out of the question, and so a little special study brought the aspiring artist up to the time when he entered the office of the late P. C. Hardwick, to serve his three years of pupilage with a man who was clearly competent to teach. A tour on the Continent with F. P. Cockerell, son of the great Pro-

the generosity of the late W. H. Smith, will recognise a specimen of design unequalled by that of any contemporary. The church of Saint-George, at Cannes, was built as a memorial of the Duke of Albany. This includes a small side Chapel containing a replica of the monument by Sir Edgar Boehm, R.A., in the Memorial Chapel at Windsor. This church was consecrated in February, 1887.

fessor—and a worthy companion in a worthy cause—followed, and then in the year that he went back to Trinity to take his M.A. degree, he began practice as an Architect, and commenced life of professional work which has brought him so much honour and reputation. When he was but thirty years of age, he became President of the Architectural Association—a very different institution to what it

is now—and later became a Fellow of the Institute, without, however, taking a very pronounced interest in the professional societies. During the years which followed Arthur Blomfield did some grand work; he built Denton Manor, in Lincolnshire, for Sir William Welby Gregory, Bart., and this is, perhaps, his most important mansion. He "did" the Bancroft School at Woodford, for the Drapers' Company, the new great school and later buildings at Charterhouse, Godalming, and the new Queen's School and Lower Chapel at Eton College. It was shortly after the opening of this latter work by Her Majesty in 1889, that its Architect received his knighthood, and never an artist of more charming methods than he has earned the recognition which a knighthood is supposed to give. Sir Arthur, as is well known, has been Architect to the Bank of England for many years, and is responsible for that fine building which neighbours poor Street's masterpiece in the Strand.

Londoners also know Sion College Library, on the Thames Embankment, with its fine timber roof, St. Saviour's Church in Oxford Street (1871), the Whitgift Hospital School at Croydon, the new buildings for Shrewsbury School, the Church of St. John, Wilton Road, and the enlargement and remodeling of St. Peter's, Eaton Square, which is a splendid piece of work. Perhaps, however, his Church at Southsea is his masterpiece, and those who have seen that evidence of

the generosity of the late W. H. Smith, will recognise a specimen of design unequalled by that of any contemporary. The church of Saint-George, at Cannes, was built as a memorial of the Duke of Albany. This includes a small side Chapel containing a replica of the monument by Sir Edgar Boehm, R.A., in the Memorial Chapel at Windsor. This church was consecrated in February, 1887.

In September of the same year was consecrated the English church of St. Alban, in Copenhagen. It was by the special desire of the Architects of Copenhagen that an English Architect was employed, and the high approval with which the work was regarded was subsequently shown, when, on the completion of the church, the King conferred upon Sir Arthur the order of the Danebrog, and the

IN THE CLOISTERS OF THE CATHEDRAL LE PUY.
FRANCE, 1891.

Royal Academy of Arts of Copenhagen elected him an honorary member. The little church of St. Moritz is also by this distinguished Architect. On the other side of the Atlantic, Sir Arthur has built the Cathedral of St. George, at George Town, Demerara, which, owing to the nature of the soil, had to be constructed principally of timber, the whole resting on a kind of raft of concrete. Also the church of the Falkland Islands, for which all materials, except the rough building stone and sand, had to be sent from England.

Sir Arthur has, for many years past, been Architect to the cathedrals of Salisbury and Chester, and to the church of St. Mary Redcliffe, at Bristol: but, perhaps, the most interesting work he has had to do in connection with an ancient church, is the rebuilding of the Nave of St. Saviour's, Southwark. The Nave has only lately been completed on the old lines. The repairs of the Transepts are now in progress, and it is hoped that in the course of another year the whole work, commenced four years ago, may be finished.

Like most of the leading men of his profession, Sir Arthur Blomfield tucks himself away in one of those quiet West End thoroughfares where the spirit of commercialism is unknown, and where the goddess of art can—if she cares to do so—creep blindfold past the commonplace residences which would make her shudder, should she glance up at them under the light of day. The architecture of Montagu Square and its environs is distinctly not noble, and on the same appropriate footing with the cobbler who badly shoes his own offspring, so again, like most of his fellows, Sir Arthur houses himself in a habitation which pretends to nothing but a complex arrangement of stock

bricks and mortar. But they groan inrepentant agony with the burden of a life's architectural work which covers the staircase walls, and runs over into all the offices and rooms throughout the house. What strikes one as being somewhat unusual in a man of his attainments is, that Sir Arthur Blomfield has been no slavish worker in one particular style, and although his particular period is late Gothic, one detects fine examples of early Gothic, Perpendicular, Jacobian, Classic and Renaissance work, which have come equally well from his fertile pen.

Sir Arthur Blomfield has worked, during the whole of his career, behind the curtain of publicity. His peculiar talents, and his undoubted position in his profession, have made no other course necessary; but, although he strongly disbelieves in the value of any number of letters peculiar to membership of professional societies, he would not, for an instant, dispute the good the Royal Institute of British Architects has done for the improvement of Architects and their art. A man of great modesty, of consideration, and good nature to the younger members of his profession, this Associate of the Royal Academy, of 1888, has taken a noble part in the advancement of art in his own country. He notes with evident delight the improvement in all manner of buildings, traces the higher appreciation of the community for artistic as well as healthy houses in which to live; and if beauty is not to be met with on every hand, the

time is coming, he has no fear, when the whole land will blossom with architectural purity and good taste. As the clocks are striking eight in the chill, wintry mornings, Sir Arthur Blomfield approaches his table for the day's work, and a man who, having

passed the meridian of labour, and arrived at that haven from whence he can survey forty years of brilliant toil and brilliant success, has no need to fear the opinions of his fellow men. Arthur Blomfield is twice married, and has sons of much artistic promise working at his side. Mr. Charles J. Blomfield, who was educated at Charterhouse, and is a Captain in Artists' Corps of Volunteers. The younger, Mr. Arthur C. Blomfield, is, like his father, a Trinity man, and has taken his Bachelor and Master's degrees; this young architect is a remarkably good and rapid draughtsman and much is expected of him. If a word were needed to show Sir Arthur's kindness of heart it is in his appreciative reference to his

nephew, Mr. Reginald Blomfield, M.A., about whom we have ourselves much to say. These are Sir Arthur's exact words, "My nephew is not only distinguished for his beautiful drawing and artistic attainments generally, but for his literary power—witness his "The Formal Garden in England."

When the time comes, which is happily not for many years, when Sir Arthur Blomfield ceases to take any further active part in the advancement of his art, he will leave behind him a reputation which will be as bright and lasting as any that the century has made.

REPORTS upon the cathedral monuments of Worcester and Lichfield have been drawn up by Mr. Reginald L. Poole, and will be printed in a volume now in preparation by the Historical Manuscripts Commission, which will also contain the Rev. W. D. Macray's reports upon the records of the Corporations of Lincoln and Bury St. Edmunds.

£95,000 is the sum the Town Council of Brighouse want to borrow for sewerage purposes. The Local Government Board have sanctioned the loan.

MR. A. A. STOTT has prepared plans for a new school in High Street, Heckmondwike, to cost £10,000.

At the meeting of the Worcester City Council, it was stated by Mr. Williamson that the total loss on the electric lighting works for the first quarter was less than £100, and he held out strong hopes that by next winter the scheme would be bringing in a profit. He further stated that the builder's extras in the erection of the generating station amounted to between £4,000 and £5,000. The Committee regarded that as very unsatisfactory, and they proposed to enquire into the matter exhaustively, and see what extra work had been done and by whose authority.

NOTRE DAME D'ORIVAL, FRANCE, 1891.

TERRA COTTA.

AMONGST many architects, terra cotta usually suggests a cheap substitute for stone. Designs are frequently made in which cornices, window dressings and other moulded features are intended to be of stone, but can be executed in terra cotta, should their cost in the former material prove too high. Driven by necessity to the use of terra cotta, many have continued to employ it from choice. Its enthusiastic admirers can boast that it is a more honest as well as a more durable substitute for stone than the once popular stucco.

As regards its durability, many architects and builders can refer to examples discovered amongst ruins of stone architecture, where the latter has shown marked signs of decay, while the terra cotta, although less perfectly fired than that of modern manufacture, has preserved its original forms unaffected by the destructive influence of centuries. Upon the question of economy, when it is pointed out that plain ashlar facing in Portland stone costs in London about three times as much as similar work executed with terra cotta bricks, what can the advocates of stone urge in reply? Of course, when we come to ornamental work, the difference in favour of terra cotta is still more striking, while its admirers may be heard to ask, "Where is the carving that can excel good terra cotta ornament in grace and truthfulness of outline?" With reference to internal work, such persons can apparently present a very strong case for their favourite material. "See," they may remark, "how readily it is applicable as a protective and decorative casing to iron construction! There is nothing false about it; nobody is led to believe that it is solid. It is open to treatment with colour in a variety of ways. Colours may be embodied in the material itself by admixture with the clay, previous to moulding and firing; or coloured glazes may be applied to the surface of pale terra cotta; or again, to stray a little from the subject of terra cotta proper, the material can be coated with opaque coloured slips, as in Della Robbia ware and similar products. But why not apply decorative pigments to the surface of ordinary terra cotta, as the Greeks did? Clearly this material awaits extended use in many ways, not least as a fireproof substitute for plaster."

Objections can be urged against any material, and it is not difficult to imagine what can be said by those who have encountered disappointments in their experience of terra cotta. "Not to mention occasional discolouration," they will tell us, "the danger of distortion through unequal shrinkage in firing forms a standing objection to the use of terra cotta for moulded work. Cornices and strings cannot be worked with the same precision as in stone. If the blocks are slightly—ever so slightly—warped in the process of firing, we find that long lines of mouldings, instead of being straight, present a wavy appearance, while curved surfaces meet unevenly where jointed. To correct slight irregularities with the chisel is a laborious process, not always satisfactory in its results; moreover, it removes the 'skin' from the surface of the ware, greatly impairing its much-boasted durability. The danger of distortion is greater in proportion to the size of the blocks, and joints are especially unsightly where figure subjects are introduced. All things considered, we cannot regard terra cotta as a perfect substitute for stone. The combination of colouring matter with the clay may be effected with success, but is often doubtful in its results, and glazed ware is expensive, besides which, sharp angles cannot be satisfactorily executed in it."

It may be said of any material that they

PORTION OF NORTH ELEVATION, NEW ADMIRALTY OFFICES.

are best qualified to use it who take full cognisance of the difficulties attending its use. Such objections as can be stated against terra cotta should serve to guide us in the employment of it to the best advantage. Can we reasonably expect it to supply the place of stone? and if not, is it not applicable to many purposes for which stone is unsuited? Is it not a necessary condition in good architecture that every material should have its own distinctive treatment? Instead of making designs which can be executed either in stone or terra cotta, according to the amount of money available, would it not be more artistic to make alternative designs in which full justice could be done to the capabilities of each material in turn? All these are questions that will naturally suggest themselves to the mind of a thoughtful architect, who, in seeking to solve them, will probably avail himself of such practical advice as experienced manufacturers can offer. It will be his aim, not only to contrive suitable details for the buildings which grow into being under his eye, but also to add his individual contributions to the progressive development of the various handicrafts enlisted in the service of his art. He will naturally seek to show the capabilities of every material to the best advantage, while making all subservient to the main purposes of his design. To devise suitable methods of treatment for any material, is virtually to invent a style which will be characteristic of it. Recognising such difficulties as a tend the architectural use of terra cotta, we are naturally led to devise forms for it which could not be produced with equal success in stone. If it be found that terra cotta cornices show less advantageously in continuous straight lines, it is at the same time evident that we can have a freer hand with it in curvilinear forms than with stone, because we need not confine those forms within the dimensions of rectangular blocks; there is no cutting to waste. If, in the case of continuous ornamental terra cotta friezes, the joints are thought to be too conspicuous, it may be well to form divisions in the ornament at intervals where the joints occur. It is so easy to arrange for joints only in the most convenient places, when the material we are dealing with can be moulded into any form. This seems to be forgotten by many who persist in designing terra cotta ornament with masons' joints in it. In many instances the structural lines can be made to follow the outlines of ornamental detail in ways that are impracticable in stone, and joggled and keyed joints can be worked in without detriment to the general effect. Mouldings can be mitre-jointed, and rebates and tenons can readily be made available. Structural and decorative suggestions can be borrowed in turn from the mason, the joiner, the wood carver, and the metal-founder, to be applied with judgment by those who are qualified to labour in the formation of a terra cotta style. It need not be imagined that the past has exhausted the capabilities of this material. Hints have been borrowed from the terra cotta remains of Greece, Etruria, Rome, Pompeii, and mediæval Italy; but still there is almost unlimited scope for further artistic developments. The art of combining terra cotta suitably with other materials invites more attention than it has yet received. There is a wide field for the employment of open traceried work, especially in interiors, where it will show to advantage upon a background of darker material. Amid the restless striving after novelty which is so characteristic of this age, there are signs that terra cotta will hold a far more important place in the architecture of the future than it has hitherto, and that it awaits developments and combinations both in form and colour which are already presaged in some of the works of our foremost architects.

THE ADMIRALTY OFFICES.

THOSE who can call to mind the exciting competition, of ten or twelve years ago, for the "Admiralty and War Offices," when a couple of unknown young men carried off the palm with a set of marvellously executed drawings, disclosing capabilities of planning no less astonishing, will, when they see the first outcome of the amended scheme, now fast nearing absolute completion, regret that Messrs. Leeming and Leeming, the young men in question, were

designs submitted in the Admiralty and War Offices' competition of so many years ago. We remember it was our opinion at the time that no one design transcended so much above all others that it could with justice to the scheme be immediately selected, and until competitions for great national buildings are conducted in a different method than they are at present, it should not be impossible to justify the blending of different men's ideas into a perfect whole. A little co-operation in such matters would be wholesome and satisfactory, and the fact that a couple of

sed the original design has just been finished by Messrs. Leeming, at a cost of £150,000—£23,000 of which went for foundations. The builders seem to have gone down 30 feet for the London clay upon which they laid a 6 feet bed of concrete, and surrounded it with a wall of concrete, which formed a hollow basin 300 feet long and 106 feet wide, upon which the new building stands. It rises to six stories in height, is constructed of steel framing cased externally in red brick and Portland stone, very much "amended" in detail from the original drawings of the archi-

PRINCIPAL FACADE OF THE NEW ADMIRALTY OFFICES

LEEMING & LEEMING, ARCHITECTS.

not permitted to carry out their first conception. All the best architectural schemes in this country seem never to get beyond a preliminary stage. Any amount of fuss and bluster is given off at the beginning, and when the finest architectural talent has been devoted to the preparation of a large number of beautiful drawings—carefully considered plans and elevations, amendments of all kinds drop down from the skies, and a very undignified fizzle is the result. We do not wish to re-open the merits of the various sets of

country architects, whose fame had hitherto been bounded by the extent of their parish, were able to beat the highest practitioners of the country in a national building to cost close upon a million of money, goes very very far to prove it. However, having been selected by a competent board of assessors as the authors of the best scheme, we confess we regret that the scheme was not proceeded with. The site on the Horse Guards' Parade cost the Government just half a million, and upon it the first pile of patchwork which super-

sects. All the working rooms, of which there are 120, have windows in the front elevations, the corridors surrounding open courtyards across which the lavatories are built. Open fire places are in all the rooms, and in summer the heated brows of the Government officials will be cooled by breezes wafting over refrigerating apparatus. But, beyond this, there is nothing approaching to extravagance, either in the construction or fittings, and the *Daily News*, which, we presume, knows more about the aims of the present Government than we

do, says, "There is no sort of show place anywhere about it. There are on the first floor a number of reception-rooms, and on this same floor, and on the same side of the building, that looking across the park, are the rooms allotted to the naval lords. The first lord's apartment overlooks the Horse Guards' Parade." It was at one time determined to take one of the best rooms on the park side as the Admiralty board-room, instead of the one in which the affairs of the British navy have been discussed and controlled ever since the Admiralty was built. This old board-room is a fine and interesting chamber, and it has direct association with all the most momentous and thrilling events of our modern naval history. A very natural sentiment appears to have prevailed against any change, and it now seems to be settled that the Admiralty Board shall meet round the old table in the old room. But, for for how long! When the north block of buildings is completed, and it is to be proceeded with at once, and the columnar screen erected along the south front of the site, to connect the old buildings with the new, it will inevitably be discovered that Ripley's building, erected a century and a half ago, is no longer a fit adjunct to the naval administration of Great Britain, and the inevitable will again happen—it will be pulled down, and the site treated as best it can be. The opportunity of treating it as a whole will be gone, and the patch-work will have cost the country a quarter of a million more than the original scheme.

ON OBSERVATION.*

BY LEONARD STOKES, F.R.I.B.A.

OBSERVATION has been defined as "the act of fixing the mind or attention on anything." Now, as so much of a young architect's work and career depends how, upon what and to what extent he fixes his mind, or attention, upon such a variety of "anythings," that I thought, when asked by your secretary to read a Paper before your society, I might perhaps do a good deal worse than give you a few of my notions on this subject, though at first sight it may not seem a very attractive one. As, however, I was born no very great distance from the spot where I now stand, I can at any rate crave your indulgence, and I know that no Lancashire lad has ever yet appealed in vain to his fellow countrymen.

To begin with, I propose to confine my observations to-night to such subjects as are more immediately connected with and interesting to the young architect—though some of my remarks may, of course, reflect to the credit, or otherwise, of our seniors. This I cannot, of course, help, as, if we are to learn anything at all by observation, it is to our seniors, be they alive or be they dead, that we must look for much of the material for our object lesson.

Before going further, however, let me ask you to take my Paper in the perfectly open and friendly spirit in which it is written, and if from time to time any of my observations should appear to you unfair or perhaps untrue in any way, make no observation at the time, but correct me in the discussion which I hope will follow. On the last occasion on which I was honoured with a request to read a Paper before an architectural society, I had the misfortune to be provided with a subject upon which I felt somewhat strongly. The result was that I spoke accordingly—too much so I fear—and hurt the feelings of some of those present. Now, I only tell you this because, instead of correcting me, these gentlemen upon whose corns I had trodden simply abused me, and made

assertions which were loud enough to convince anyone had they but contained a little more argument, and a little less bitterness against the unfortunate reader of the Paper, who was only stating what he thought to be true and what he was perfectly prepared to be corrected in.

To return to our subject, which I shall divide as far as may be under three heads, I fear, however, such division is hardly workable, yet trust it may to some extent make my remarks less disjointed and more intelligible than they otherwise would be, though, of course, in the nature of things they are likely to have some dislocation and but little intelligence. The three heads under which I shall divide my observations or observation as connected with the young architects are then—1st, his Training; 2nd, his Clients; and 3rd, his Work.

Firstly, then, an architect must be trained; but, stop, I have not yet said that you can train an architect, if you note the difference—you may train your draughtsman and your specification writer, you may train your excavator and scientific drainer, your bricklayer, your mason, your tiler or slater, your carpenter, joiner, ironmonger, smith and founder, your plasterer, plumber, glazier and painter, together with your hot water engineer, ventilator and electric lighter, but even then you have not touched your architect, although you may have done a very praiseworthy act, and grounded your man in many subjects which he cannot do without if he is ever to become an architect, but nevertheless you have not yet trained your architect. And now mark me, how are you to train him? Very simply. Develop his power of observation—if you can.

And here I might end my paper and save myself much anxiety and you much wearisome listening, and we might all go home the happier, did I but feel sure that I had made my meaning clear, and that you had really grasped the situation. Fearing, however, that this may not be the case, I must perforce proceed, and give reasons for my statement, and tangle its simplicity with theory and opinion.

Having just told you that observation is everything to an architect, let me involve myself at once by again sub-dividing my subject into our own observations and the observations of others. In some cases we may content ourselves with the use of the latter, but in most cases we shall do well to make our own, as *Rules* in architecture, in my humble opinion, do not exist; therefore, as a mass of exceptions, each case must be treated on its own merits, observation—the eighth lamp of architecture—saving where following so-called rules, precedents and formulæ, would inevitably plunge us into soulless mediocrity; and, believe me, few things can be worse than that. Greek temples and the ever present "orders," have all been reduced to such simple rules, that anyone may learn—yes, and learn with ease—how many diameters a column should be high, and how many minutes make this look well, and how many modules the other should be in order to be perfect, but with all these simple rules, where are your buildings that justify their existence? Echo answers, Where, indeed?

I would as soon believe that no man could be an architect unless he had five letters after his name, as I would that no column could look well unless it was so stipulated number of diameters high. Rules are all very well if taken with many grains of salt; but then, of course, they cease to be rules and become mere guiding principles and not hard and fast rules. The only rule that I know of which is any use whatever to an Architect is his 2-foot one, and that he should never be without, be he young or old, and he may apply it with advantage to almost any building throughout the universe.

Having swept away all rules except our 2-foot friend, what is a young man to fall back upon you will ask me? His eyes, say I. They will teach him proportion better than a book of rules; they will teach him balance, dignity, reserve, refinement, amiability and fifty other things an Architect should know. At least, if they will not, I venture to state that all the rules that ever were invented will not help him one iota. A man should feel these things. He cannot learn them from rules, but he may imbibe them by observation.

Now, curiously enough, our English system

of apprenticeship is based almost entirely upon this system of observation. The young man observes how the old man does it—somewhat in the same way, it is true, as a conjurer may be observed to bring two live rabbits and a bunch of flowers out of an empty hat, placed on a small three-legged table right under our very noses. Well, as there are smart conjurers and clumsy conjurers, so there are good architects and slovenly ones. In each case their tricks—for they are really little else—can be acquired by some of us, but I regret to say that the tricks of the clumsy are more easily observed, and therefore acquired, than those of the smart and good.

The pupil in a moderately good office undoubtedly enjoys many advantages, but if he only observes the rules of the office and does what he is told, he will not get very far I fear. No, he must not only observe for himself how certain problems are overcome on paper, but he must also observe for himself the effect and result in actual work. He might observe, for one thing, how a mistake made on paper—perhaps by himself—may involve the modification of a whole feature, or even the whole end or side of a building, when it comes to be put up. He may observe how a carelessly made and unworkable section—when reduced to bricks and mortar—produces unthought of difficulties, such as want of head room on your stairs, or such-like trifles; how foremen will always follow the *wrong* drawing if two don't happen to agree, and how easy it is for him to go wrong if there is any ambiguity in them at all. These observations will, I hope, teach him the desirability of making drawings accurate; for unless a drawing is accurate, it is very little use at all, unless it is to show to a client to whom correct or incorrect it is, in 99 cases out of 100, simply so much Greek. Showy drawings are, no doubt, a kind of credit to the office, and it is always a pleasure to look at a drawing that has some style about it, but after all, drawings are only a means to an end, and that end should always be kept well in view. If you want to win a competition, make your drawings as showy and as inaccurate as you like, but if you wish to get your building put up as you want it, then let your drawings be as numerous as possible and absolutely correct; of course, if you can make them look well into the bargain, so much the better.

Now the advantage the pupil has is that he sees so many things going on around him, and if he is worth his salt, he will take advantage of this, and the observations he should make at this period of his career will be of the greatest use to him in after life. He can, you see, train his eye on the works of his master. I don't mean that his master will let him design or alter anything much, but what the pupil must do is to observe how the design looks on paper, and form his own opinion as to what it will look like in execution (this he had better, perhaps, keep to himself), and when he sees the work in reality, he must note how far his judgment has been right, or how far he has been led to misjudge the whole by not being able to see it in his mind's eye whilst looking at the drawing only. Situation, too, may have something to do with it, and what he thought would look heavy or clumsy on paper, may look just the reverse when put in position and seen in conjunction with its surroundings—and this question of surroundings should have a great deal to do with the question of design, although I fear that enough attention is not always paid to it.

Another form of observation, which cannot well be over-estimated, is sketching and measuring existing work. You see what we have to do now-a-days is to make paper designs, which, when executed by the builder, will firstly, answer the purpose for which they are intended, and secondly, satisfy the eye. Now, a young man wanting to learn how to do this has to work backwards, so to speak. He must first find his ideal building, and then set to work to reduce it to paper; and, having done so, he should be able to look at his drawings and see the building standing out in all its balance, dignity and beauty. The more careful the study the greater the reward; and, after a time, he will be able to think on paper to any given scale, and these thoughts, when handed over to the builder, can be worked out so as to produce just the effect desired.

* A paper read before the Liverpool Architectural Society, on Monday, February 11th.

We publish this article as we receive it from Mr. Stokes, and by an act of courtesy on the part of the North Western Railway Co. are able to get his corrections before going to press. Although the whole gist of the paper could have been contained in a column of good literature, Mr. Stokes has been compelled to "fatten" it and thereby sacrifice half its power. Without in any degree accepting many of his strictures we shall reserve our criticism upon it until next week.—Ed.

The eye, too, should be trained to see things in perspective, even though they are only drawn in elevation and, if the eye cannot at first be brought to do this, the hand may be sworn in for the habit of thinking, sketching and seeing things in perspective, will be found of the greatest use in designing. Far too much work is thought out, only on the flat, and hence, when executed, is unsatisfactory; observation is the never failing remedy, and it is surprising how, after a little of it, your brain and eye become most obedient and expert, and you can either think or see round corners with the greatest ease.

Besides the study of what is generally called *old work*, the study of contemporary work should follow, hand in hand. Observe again, how our best men get their best effects, and observe also where they fail; for, perhaps, one of the greatest uses of observation lies in its teaching us what to avoid. Books, too, may be of great use to us if used judiciously, but I am inclined to think they are often very much abused, and many a man's work bears the impress of book knowledge where it should rather give evidence of independent thought and a living treatment. Photo-lithography may be a blessing in some ways, but our streets should not be simply composed—as they too often are—of a collection of the most fashionable plates that have appeared, from time to time, in the Building Journals; adapted it may be, to some extent, to their new requirements, but never looking more than make-believes at the best.

A young architect should, of course, read, and there are some books that he must almost live with, as they will help him to appreciate what is good and noble about his calling, and lift his drooping spirits after a day's specification writing or drain planning. But I cannot help feeling—take it for what it is worth—that an hour in a fine building will open a man's soul more than a week's reading; and sketching in a museum will do him more real good than all the histories of architecture that were ever written. Do not misunderstand me, pray; I am speaking of the young architect, and of what will help to develop the architect within him; but, of course, the young gentleman—forgive the term—must not be forgotten, and he must acquire many things, such as history and knowledge of the styles, &c., for general purposes, such as passing examinations, and to fit him for committee meetings and architectural societies. But it is a man's soul that has to be developed if we want to make an architect of him; and few book worms have, I think, large souls, their chests are too narrow, and I can hardly fancy a good architect with a narrow chest even, for good work seems to come from the chest and shoulder as much as anywhere; and, if these are bent and hollow, so will the work they produce be weak and lifeless, however full of precedent and learning it may be.

Books and illustrations may remind us of what we have seen, but we must observe and study for ourselves outside all books. Travel, of course, is almost, if not quite, imperative, for however fine a town may be—and Liverpool undoubtedly is a fine town—a man's soul has not room to expand even in Liverpool, although I can think of few things more likely to inspire one with fine ideas than a blow on our noble river—it is so large, so free, so bold, that when in doubt, I should certainly take it into my confidence were I a resident instead of an absentee. But even the Mersey, with all its grandeur, will only, so to speak, stir up our ideas and bring them to the surface. We must have saturated ourselves previously with the spirit of fine work, and absorbed the ideas of others, not as so many items or specimens to be palmed off from time to time as our own, but as the very food and drink—intoxicating drink even if you will—of our very existence. Observant travel is then a necessity, and every young man should make a point of seeing as much of the world as possible, as travel opens the mind and gets rid of the cobwebs that will collect about the brain of the stay-at-home.

Friends, too, and instructors are most useful to an architect, as they will often direct his observation into paths and byways that might otherwise escape his notice. Your new Professor and my old friend, Mr. Simpson, will be able to help you very much in this way. If you will go to him open-minded and unreservedly, I

know from experience that you will not come away empty-handed or unrewarded.

One point upon which I should like to insist in the training of an architect is, that he should mix freely with painters, sculptors, and other students of the Fine Arts. I don't know what possibilities of this sort you may have in your Liverpool schools and societies, but whatever chances you may have, I say make the most of them. In London we have the Royal Academy Schools, where architects, painters, and sculptors are all taught under the same roof, and there I know from experience much good is done from the fact of the students simply meeting on common ground with one common interest. Friendships are made, ideas interchanged, the mind enlarged, and observation brought to bear on fresh fields of interest. Sculptors that are at a loss when using a simple moulding, painters who cannot even draw a door step in perspective, and architects who have very little knowledge of either form or colour, are far too common amongst us. Life is, I fear, too short for each of us to receive a distinct grounding in the calling of his neighbour, but if students whose aims are not dissimilar are brought up together, they will at any rate rub the angles off each other, and quickly learn what to appreciate and what to avoid when brought in contact with work, which strictly speaking, may be outside their province. Bring up a child with a French nurse and a German governess and it will pick up a certain amount of French and German while it is being taught English. The same thing applies to an architect brought up with painters and sculptors, for he will learn enough of their language to help very materially in forming his tastes and training his judgment in all things relating to fine form and good colour.

We also have a society in London called the Artworkers' Guild, and it is formed of members of all callings into which any form of artistic work is introduced. We have fortnightly meetings, when short papers are read and discussions take place perhaps upon some subject relating to the calling of one group of members, or, may be, of some subject of interest to all. In either case the great gain to members is that they hear the views of a number of men who approach the subject from various standpoints. If you can only extend the scope of this society, and induce a number of men to join you who are practically connected with the design and production of good modern work of any kind, you will, I think, derive much benefit yourselves, and you may also help to improve those who join you, not a little.

I had rather have said nothing—if I had consulted my own feelings—upon the much debated and discussed subject of examinations, but I feel that to pass it over without a word would be, perhaps, cowardly on my part, as I have observed that the Institute examinations have taken a deep hold of the Provincial—or shall I say non-Metropolitan—architect, and particularly so in Liverpool. Now I am not going to abuse these examinations, neither am I prepared to say that I approve of them, as I look upon them as, to a certain extent, unimportant. There is, however, a kind of Examination Party at the Institute, which is trying to force and artificially foster these examinations in every possible way, to the detriment of every other project, and that I do object to as a member of the Institute; but I fear this is of no interest to you. However, it may interest you to observe for yourselves who this Examination Party consists of. Does it consist of those architects whose work you admire? Does it consist of those men to whom you would most naturally look if in doubt on a work of any magnitude or beauty? You must answer these questions for yourselves, but at the same time you must allow me to state that in my opinion it, to a very large extent, does not, and the unfortunate part about it is that these gentlemen get returned to power to a large extent by the country members on this very examination question, and when in power the whole policy of the Institute becomes "light and airy" in consequence. For you see the majority of these examination men not being architects of any very great capability, the aims and objects of the Institute are affected accordingly.

And why do the real Architects either give only a half-hearted support to, hold aloof from,

or abuse this examination movement? Because they know by observation that, although you can test your Mason, Bricklayer, Carpenter, Joiner and Sanitary Engineer, yet your Architect you cannot hope to test with any satisfactory results, therefore it is futile to try. Of course, it may be argued that it is at any rate a good thing to have good Masons, Bricklayers, Carpenters, Joiners and Sanitary Engineers in the Institute instead of bad ones. We will admit that, but unfortunately, these examinations are called Examinations in Architecture, and an effort is made to include Art (with a capital A) in the syllabus. Now I think we have come to the conclusion—at least I have—that Architecture, as apart from the knowledge of building operations, cannot be tested, at any rate by human beings. But let them try; at worst they can but damage the career of a few young men—and the craze will pass away with those who are the present heads of the movement. On the other hand, if these examinations are any incentive to honest work, and will inspire any one with a love for his calling for its own sake, and not simply with a craving for those ungainly and absolutely useless letters after his name, then, I contend, the movement will have done good, but not otherwise. Therefore, I say, observe this movement, and observe the movers in it likewise; observe those who advocate other principles, and do not be driven into either camp by catch words, empty promises, or meaningless derision; for knowing all the subjects covered by the Institute Examination won't make an Architect of you, yet, to be one, you should know something of most of them.

(To be concluded.)

MR. SILVANUS TREVAIL, the Mayor of Truro, a well known architect, was presented with a handsome testimonial at the Truro Town Hall on the 4th inst., by the Rt. Hon. the Earl of Mount Edgumbe, on behalf of numerous subscribers, in recognition of his valuable services in the matter of the railway development of Cornwall. The gift consisted of a handsome silver service of plate in the Queen Anne style and a cheque for 100 guineas.

MESSRS. J. AND H. NEVILL have recently erected a new Turkish bath in the City, which was opened by Alderman Treloar on Tuesday last. The design is by Mr. G. Harold Elphick, architect, and the style is Moresque.

THE Glasgow Institute of the Fine Arts held its annual meeting on Saturday last. Lord Provost Bell was elected president; Mr. J. G. A. Baird, M.P., and Sir John Stirling Maxwell, vice-presidents; Mr. A. J. Kirkpatrick, chairman of council; Mr. Patrick S. Dunn, hon. treasurer; and Mr. David Tullis, hon. secretary.

THE London County Council have rejected the recommendation of the Improvements Committee to construct a roadway from the Tower Bridge and Whitechapel.

THE mansion built for Mr. Cornelius Van derbilt has just been completed at a cost of something like £1,000,000. The outside design is Spanish, built of grey stone, with red facings, turrets and battlements. It has three storeys, and contains, among other attractive rooms, a ball-room, no less than 75 feet long by 50 feet wide, the ceiling of which is made in the form of a double cone with painted nymphs and cupids. Electric light is used throughout.

MR. ABRAHAM MOSLEY, of Northampton, has been appointed surveyor to the Finedon Urban District Council.

THE new Board Schools at Carville, Wallsend, are now open. They have been built on the Central Hall arrangement, from designs by Mr. Wm. Hope, of Newcastle and Shields, the main apartment being 61 ft. long by 22 ft. wide, flanked by six classrooms—three on each side—each capable of seating sixty senior scholars.

THE Rev. Canon Penrhyn opened the new elementary schools at Blockbrook, near St. Helen's, on Friday. The buildings provide accommodation for 350 scholars. The plans were prepared by Mr. Thomas Robinson, of Haydock, and the contract for the erection of the schools was taken by Mr. Peter Tickle, St. Helen's. The total cost has been £1,350.

FROM WATERLOO TO THE CITY.

THE work of constructing the underground Electric Railway between Waterloo and the Mansion House shows signs of active progress. Direct transit, without stoppages, will be effected in about four minutes, at a speed of 22 miles an hour. The departure platform of the Electric Railway being 36 feet from the surface, the use of hydraulic lifts will be unnecessary, but they will be employed at the Mansion House Terminus, where the rails will be 65 feet below the level of the thoroughfare. At Waterloo travellers will reach the lower station by easy declines. The railway commences at Waterloo at a level of 36 feet below the South Western Railway, and then descends towards the river at a gradient of 1 in 60. Passing under the river, the line is level for about 300 yards, and it then rises at 1 in 88 towards the City, and terminates opposite the civic residence of the Lord Mayor. The tops of the two tunnels will be at a depth of about 24 feet below the bed of the Thames; or, to put it another way, the rail level will be 62 feet below Trinity high water mark. At Cross Street, where the railway passes underneath the South Eastern viaduct, the depth will be 48 feet; at the junction of Waterloo Road and Stamford Street 38 feet; and at Hatfield Street, in the bend of Stamford Street, 55 feet. After passing below the river, the next important crossing is the Victoria Embankment, in front of the City of London School, where the rail level will be some 78 feet below the surface of the footway. The line goes down below the District Railway a few yards further on. At St. Andrew's Hill the District and the Electric follow the same route so accurately that the centre line of the one will be the centre line of the other until Friday Street is reached. Here they part company, the Electric going straight along under the centre of Queen Victoria Street, terminating opposite the north western corner of the Mansion House. From the indication of the gradients; it will be seen that the railway rises and falls somewhat after the manner of a "switchback."

The total length of the line will be one mile and a half. The traffic will be conducted by an up and a down line, each occupying a separate tunnel, cast-iron, running parallel to one another at a distance of about four feet. Where the railway is straight, or on a flat curve, the internal diameter of the tunnels will be 12 feet, but where the curves are sharp the tunnels will be enlarged in diameter to 12 feet 9 inches, so as to prevent the possibility of the long "bogie" carriages, which are to be used, fouling the sides. Beyond the fact that electricity is to be the motive power the details are not yet settled, but the opening of the railway may be anticipated in about two and a half years hence.

The station in the City will be entirely underground, and passengers will be brought to the surface in capacious hydraulic lifts. The station tunnels, like the railway, will be of cast-iron, built on Greathead's principle, but of large dimensions, namely, 23 feet internal diameter. From near Hatfield Street, towards the City, both tunnels will be in the London clay, but from Hatfield Street towards Waterloo, as the line rises in that direction, it encounters ballast. Here water will be met with in large volumes, so it will be necessary to construct this portion of the railway under compressed air, as was done in the City and South London Railway by Mr. Greathead, and is now being done in the construction of the Blackwall Tunnel by the London County Council. The object of commencing work by sinking shafts in the river, is to enable the material to be brought up by cranes and at once deposited in barges. Messrs. Galbraith and Greathead are the engineers; Mr. Dalrymple Hay being their engineer on the works, and Messrs. John

Mowlem have the contract. Immediately after the letting of the contract in June, they began operations by constructing the stage near Blackfriars Bridge. Here two cast-iron cylindrical shafts have been sunk to a depth of 40 feet below Trinity high water mark, one above each of the proposed tunnels. Below the cylinders the shafts are of brickwork in cement, and as soon as the depth of the floors of the intended tunnels attained the four protecting shields and the mechanical excavators will be lowered into position, and the driving of the tunnels carried on simultaneously in both directions. As soon as the first ring of the culvert is put together, a shield is put in the front: through a door in it the face of the heading is accessible to the miner, who picks out the central core of the rock. The shield has a projecting edge all round its periphery, which, as the shield is pushed forward by the hydraulic presses, cuts a circular sufficiently large for putting the iron segments together to the proper dimensions of the culvert. Wedges being inserted in the rock face between the periphery of the shield and the central core cavity, the intervening rock is broken into fragments and falls down between the shield and the face of the heading, being shovelled up thence and sent away to the rear in skips. Thus the progress will be made, ring by ring, one at a time, each ring advancing the tunnel by two feet.

SOCIETY MEETINGS.

The Institution of Mechanical Engineers.—The forty-eighth annual general meeting of the Institution was held in the rooms of this Institution in Great George Street, and was largely attended. Professor Alexander B. W. Kennedy, having been re-elected president, took the chair, and moved the adoption of the Council's report for the past year. The report stated that at the end of last year the number of names in all classes on the roll of the Institution was 2,221, as compared with 2,157 at the end of the previous year. During 1894 there were added to the register 152 names, against which the loss by decrease was 31, and by resignation or removal 57. The financial receipts during the past year had been £7,081, while the expenditure, actual or estimated, was £5,292. The capital of the Institution amounted to £38,535, the greater part of which was invested in railway debenture stocks. Experiments upon the use of ropes and belts for the transmission of power, announced a year ago as about to be undertaken by the Société Industrielle du Nord, at Lille, had since been carried out, and Professor Capper, who attended them on behalf of the Institution would make an independent report upon them in due course. In reply to a member the President stated that a committee had been appointed to consider the question of applying a portion of the funds of the Institution to securing a place of assembly of its own in London.

Plymouth School of Art.—In continuation of the series of lectures on "Architectural History," before the junior members of the Architectural profession of the Three Towns, at the Plymouth School of Art, Princess Square, Mr. B. Priestley Shires, A.R.I.B.A., delivered the eleventh lecture on the 31st ult. In his opening remarks Mr. Shires mentioned the causes which led to the development of the Romanesque styles in the tenth century, and said in the eleventh century each country struck out a style of its own, Germany retaining more of the older characteristics than either France or England. As long as the unbroken horizontal lines continued in use, so long may English-Norman work or the Anglo-Romanesque style of architecture be classed as purely Romanesque; but when vertical shafts were introduced running up in front of the piers in ecclesiastical buildings, and dividing the triforium and clearstory into compartments, then the first principle of Gothic architecture began to manifest itself, and, coupled with the use of the pointed arch, many new features were developed. Without going into any of the many theories as to the origin of the

pointed arch, Mr. Shires thought it was by far the best plan to consider the pointed arch in the same light as nearly all other architectural features, as a development. The Gothic period practically began with the thirteenth century and closed with the fifteenth century, as far as good Gothic architecture is concerned. The term Gothic was first used more as a term of reproach than for any other reason, and intended to distinguish those buildings which were considered barbarous in style, that is, those which were not classic. During those centuries it prevailed more or less throughout the western, middle, and southern parts of Europe, and though there are some variations in the buildings of the different nations who adopted it, still, as a whole, they are practically one style.

Manchester Society of Architects.—

On the 5th instant Mr. J. D. Sutcliffe delivered a lecture on "Combined Warming and Ventilating," before the Manchester Society of Architects. The lecturer contended that the warming effect of an open fire upon a room is not obtained direct from the rays of heat, but from their reflection from the various material objects into which they come into contact, otherwise that the sole effect of the fire is to draw cold air into the room, especially along the floor. Much more warmth was derived by direct radiation from common stones, pipes and coils, but in all of these cases there was no ventilation, the same air being breathed and warmed over and over again. Indirect radiation he described as obtained by the passing of air over heated surfaces, and thence into the room, always securing some ventilation as well as warmth. This combined warming and ventilation when provision is made for supplying fresh air and simultaneously discharging vitiated air. He instanced the American system of Messrs. Smead. According to the lecturer, that system does not admit of proper provision for filtering the air where the conditions of the atmosphere render that necessary. The Plenum system, he said, is the best for large buildings, and is always associated with mechanical force, and admits of any filtering arrangements. A fan draws in external air through a filter, and at the same time propels it through heating apparatus, whence the filtered and warmed air is driven into main and branch ducts that terminate in the rooms to be warmed. Entering above the heads of the occupants, the warm air necessarily rises at once to the ceiling, where it spreads, cools, and consequently descends, eventually passing out at the floor level by exit-ducts there provided. Dusty and other vitiated air is thus prevented from rising, and the weight of the respired carbonic acid gas accompanies and aids the descent. Experience proves that the warmth so derived is agreeable and equable and the system prevents inward draughts or the entry of any contaminated atmosphere from outside, such entry being often experienced where mechanical force is applied solely for drawing foul air out. The system provides for entirely renewing the air of the room at any desired rate up to ten times an hour. It has been theoretically inferred that air, when treated as described, must be unhealthily dry, but repeated tests prove the presence of ample moisture.

THE Corporation of Aberystwith have inaugurated the installation of the electric light along the marine front and main portion of the town. The Esplanade is lighted by arc lamps of 2,000 candles, placed 45 yards apart, but smaller ones are used in the street thoroughfares.

MR. E. LINGEN BARKER, the architect of Hereford, has just commenced the intermediate schools at Newport, Mon. Messrs. Thomas & Co., of Swansea, are the contractors at £5,500.

OUT of 163 candidates for the post of surveyor to the Brentford local board, Mr. Nowall Parr, from Walsall, has been selected at a salary of £250 and a liberty to act as consulting engineer.

THE City Commissioners of Sewers have just adopted a report recommending that powers be obtained to provide urinals and Washhouses within the City, at a cost, it is suggested, of £100,000. At the same meeting, it was decided to carry out a street improvement in Dean's Court and St. Paul's Churchyard, at a cost of £2,000.

Trade and Commerce.

In these columns nothing but matters of current commercial importance will be treated. New materials will be discussed—not puffed, inventions analysed, and improvements noted. The Editor will gladly receive communications from his correspondents, but it must be clearly understood that in no case will any notice of a new manufacture take the form of an advertisement, either from firms who advertise their goods in "THE BUILDERS' JOURNAL," or from those who do not. Small and plain illustrations detailing the material or manufacture discussed may be sent, and if found suitable, will be inserted.

Messrs. Young & Marten, of Stratford, write; "Herewith we have the pleasure of handing you a copy of our new Chimney Piece, Grate, Tiles, Stove and Kitchen Range Catalogue, bound in stiff cloth, and consisting of 214 pages. Twenty of which are lithographed in colours in highest class of workmanship. This forms Section I. of our complete Catalogue, which, when completed, will consist of at least 600 pages, and will cost something near £4,000 for production. We believe we are correct in saying that it is the finest work of its class that has ever been attempted as a Trade Catalogue for the Builder, Plumber, Decorator and Sanitary Engineer. We anticipate it will be ready for issue in its entirety on the 1st June next, and we are prepared to receive names and addresses from your readers for a copy when ready. We may say that the remainder of the work will be carried out on the precise lines as that shewn in the Section now under consideration. We shall esteem it a favour if you will give us an impartial and exhaustive review of the present Section, and refer to the complete work in contemplation." Messrs. Young & Marten claim nothing for their work which we cannot accept. It is, indeed, a most carefully compiled catalogue, and it has the additional virtue—which is somewhat rare—of showing goods, their styles, their characteristics and their prices, clearly and concisely, without wading through intricate indices and references, which bewilder an ordinary individual and very often drive him mad. We have never seen more honest illustrations, which, however, and without a single exception, are drawn in that odd mixture of geometrical and perspective drawing peculiar to illustrated catalogues, and which no manufacturer has yet had the courage to discard. The coloured sheets of tiles for hearths and panels, grates, dados and pavements are really charmingly executed, and the printing of the whole work, and the general "get up" of the catalogue is of a very high order. Messrs. Young & Marten are unduly modest when they dedicate their work to the Builder and the Plumber and the Sanitary Decorator. There are several items, particularly registers with overmantels, from which many architects would learn something of good design.

Laxton's Price Book for 1895 is sent to us by Messrs. Kelly, and, no doubt, is in the hands of thousands of Surveyors, Architects and Contractors, for whose special use the work is compiled. It hardly needs a word of recommendation, except that it is again brought up to date, contains *in extenso* the London Building Act of 1894, and should lie on the shelves of every Architect and Builder who can afford so low a price as four shillings for it.

Lockwood's Builders' Price Book for 1895 has also reached us, and has one distinctive feature, which in this respect makes itself as acceptable as the better known "Laxton." Mr. Francis Miller, the Editor, has continued his short measurement constructions in all trades, which are very useful, as they come from a very practical man. The published price is four shillings. The book is published by Crosby, Lockwood & Son, of Stationers' Hall Court,

Colchester Camp.—The contract of Messrs. Grimwood & Sons, of Sudbury, has been accepted for the re-building of A and B lines in Colchester Camp, and work will probably be commenced in the early spring. The firm has already partly completed the building of the very extensive new Military Hospital, which is being erected on the Abbey Field. As it is understood that the plans of the reconstructed Camp provide for the erection of substantial two-storied brick huts for the men on the principle adopted at Aldershot, and that handsome and substantial officers' quarters will be built facing the Abbey Field, in place of the present unsightly brick wall, the improvement that will be effected in the garrison accommodation will be a very important one.

Notes & Queries.

Under this heading, Questions on all matters appertaining to the art or science of Building may be made by subscribers; and their fellow readers are invited, under our own supervision, to furnish replies. Post-cards headed "Notes and Queries" may be used in correspondence and addressed to the Editor.

QUERIES.

[1.]—**Curious Buildings.**—Comment is made in another column on a curiously constructed house in a village of Norfolk, in which the "heads" of leg, loin and "knuckle" bones have been used in cornice and string courses in a stone and flint built front. Will our readers send us particulars and (where possible) photographs of any equally curious instances of construction?—THE EDITOR OF "THE BUILDERS' JOURNAL."

[2.] The passage wall in the basement of my house in Westbourne Park suffers from chronic dampness to a height of about 4 feet from the floor. I have used every contrivance to stop the nuisance, and have dug under the foundations and can find no apparent cause. Matchboarding has bulged and swollen away from the wall. What can, with unbounded patience, be done next?—C. J. COMERFORD.

[3.] I have heard of a book which deals with the work of Wren, and gives most accurate drawings of most of his churches. Mr. Batsford does not know of it. Can any of your readers throw any light upon it, and if there is such a book, say where it can be seen?—ARCHITECT.

[4.] I want to heat a conservatory 14 ft. by 10 ft., using the kitchen fire supplemented by gas—outside the conservatory—during the night, or when the kitchen fire is not in use. What is the best apparatus, and who is the maker of it?—A. T. W.

[5.]—There is a liquid which, used with ordinary thick Indian ink, will not dry up quickly in the palette, or "run" when washed over on a drawing. What is it?—MEMBER OF THE A.A.

N.B.—We have received a number of queries which are quite unsuited to publication, inasmuch as they would probably prove of little interest to anyone but the querist. Correspondents must be as liberal-minded in these matters as we are ourselves.—ED.

Correspondence.

The Editor welcomes Correspondence on matters of general interest. Gentlemen thus addressing the Editor should condense their communications as much as possible.

We have received several communications, mostly of a laudatory character, from gentlemen who have seen the Specimen issue of this journal. We are thankful for the good opinions, but are selfish enough not to allow our readers to share our enjoyment.—ED.

SAWDUST.

THE annual dinner of the Society of Architects will be held on Tuesday week, Feb. 19th, at St. James' Hall, Piccadilly, W., at 7.30 p.m. We understand that a number of guests, distinguished in Church and State, Art, Literature and Science, have accepted the Society's invitation to be present.

MR. ARTHUR B. JACKSON, A.R.I.B.A., has been appointed a Surveyor, under the Ecclesiastical Delapidations Act, to the diocese of St. Alban's.

APPLICATION has been made to the Local Government Board, by the Town Council of Darwen, for powers to borrow £6,000 for the purpose of erecting a new Municipal Lodging House in the Borough.

At Colchester, on Sunday morning, Mr. F. Dupont, a well-known local Builder, and Contractor, having premises at North Hill, attempted suicide by cutting his throat with a knife. He had suffered from sleeplessness, and was much depressed. The wound was a serious one, but Mr. Dupont is recovering.

THE County Council discussed, on Tuesday, a scheme submitted by the Improvements Committee for making a better northern approach to the Tower Bridge by a new street from Tower Hill to Mansell Street, part of the large outlay to be recouped by a betterment charge on the owners of property. An amendment to defer taking any action in the matter at present was adopted by a majority of nine. It was agreed to co-operate with the Commissioners of Sewers in the widening of Upper Thames Street at its narrowest point, by contributing one-third of the outlay, such contribution not to exceed £12,500.

A PREMIUM was lately offered for the best plans for a cottage hospital at Aldershot, and 94 sets of plans were sent in. The assessor was Mr. W. D. Caröe, F.R.I.B.A. The successful competitor is Mr. Thomas Davison, A.R.I.B.A., 41, Oakley Crescent, Chelsea. The estimated cost is £2,000.

At a joint conference of the finance committee of the Middlesex County Council and the Highgate justices, held at Northfield Hall, Highgate, it was resolved to recommend to the Council to purchase a large plot of land at the corner of Archway and Church Roads, Highgate, for the erection thereon of new police-court buildings for Highgate and the district. At present the petty sessional sittings are held at Northfield hall, which has been found inconvenient and inadequate in many respects for the purpose.

THE sixth meeting of the Discussion Section of the Architectural Association was held at 56, Great Marlborough Street, on the 6th inst., when Mr. Harry Sirr, A.R.I.B.A., read a paper on "Domestic Metal Work." The paper was illustrated by a fine collection of sketches and metal objects lent by Messrs. Mackmurdo, Hugh Stannus, May, Hooper, Guy Dawber and Millard. In the discussion which followed the paper, Messrs. Greenop, Hopkins, Fellowes-Prynn, Rathbone Garbutt, Guy Dawber, Hooper and W. Henry White, the Chairman, took part.

It is stated that a company has been formed for the purpose of erecting colossal stores in the West-end. The first practical move has been made by the purchase of a plot of land in Westbourne Grove for over £30,000.

THE BLYTHEWOOD DAIRY. By Mr. W. D. CARÖE, M.A., ARCHITECT.

COMPETITIONS.

COUNTY BOROUGH OF WEST HAM.

COMPETITION.

The Council of the County Borough of West Ham propose to ERECT a TECHNICAL INSTITUTE and PUBLIC LIBRARY in Romford Road, and they hereby invite Architects to submit DESIGNS for the same in competition.

Premiums of £250, £150 and £100 respectively will be paid to the Authors of the Designs which are placed by the Assessor first, second, and third in point of merit.

The Competitor to whom the first premium of £250 may be awarded will be employed as Architect, and will be remunerated in accordance with the schedule of professional practice and charges of architects, published by the Royal Institute of British Architects, such remuneration being independent of the premium.

The Council have appointed Mr. J. MACVICAR ANDERSON, F.R.I.B.A., 6, Stratton Street, Westminster, W., as their Assessor and Professional Adviser.

Designs are to be delivered at the Town Hall, West Ham, E., not later than FOUR p.m., on WEDNESDAY, 1st May, 1895.

Full particulars of the instructions and conditions can be obtained on application to the undersigned, on payment of a deposit of One Guinea, which will be returned in the event of the applicant either submitting a Design, or returning the instructions within one month from the date of receiving them.

By order of the Council,

Town Hall, West Ham, FRED. E. HILLEARY,
January 21st, 1895. Town Clerk.

ERDINGTON (near BIRMINGHAM), MARCH 30.

COTTAGE HOMES.

The Guardians of Aston Union invite Competitive Plans, with specifications and estimate, of Cottage Homes to be erected at Erdington, near Birmingham. The Architect who sends in the plans selected as best will be appointed Architect for the erection of the buildings, or be awarded a premium of £70, as the Guardians may decide; and he who sends in the plans selected as second best will be awarded a premium of £30.

A copy of instructions to Competitors and conditions of competition, together with a plan of the site, may be obtained on and after 9th inst. from Mr. JOHN NORTH, Clerk, Union Offices, Vauxhall Road, Birmingham, on payment of £1 1s., which will be returned on the receipt of *bona fide* plans, specifications, and estimate. Plans, &c., must be delivered by March 30.

IPSWICH.—MARCH 23.

DESIGNS are invited for the Building of a WORK-HOUSE and INFIRMARY, with Specifications and Estimate. Premiums £100 and £50. My. A. F. VULLIAMY, Clerk to the Guardians.

TO ARCHITECTS.

DESIGNS and ESTIMATES are invited by Mr. N. Miller, of 95, Fishergate, Preston, Lanc. for a proposed FIRE-PROOF BLOCK of SHOPS, OFFICES, TWO HOTELS, &c., at a cost of from £45,000 to £50,000 (which latter sum must not be exceeded), on an area of 2,500 square yards abutting on to Church street, Lancaster road, Jackson-street, and Birley street, in the County Borough of Preston, Lancashire.

Premiums of £150, £100 and £50 are offered (in the adjudged order of merit) for the three designs which are selected as the most suitable, and which three designs will become the absolute property of Mr. Miller.

The winner of the first or any other premium will not necessarily or in consequence become entitled to carry out the work, but if he be selected to do so, the premium will be deducted from his remuneration.

A plan of the site with instructions to Architects can be obtained from Mr. MILLER, on payment of £1 1s. which will be returned to those sending in *bona fide* Designs.

All Drawings, &c., must be marked with a motto or device, and sent to the Borough Engineer's Office, Town Hall, Preston, and the name and address of the designer in a sealed envelope, bearing on the outside the same motto or device, to Mr. MILLER, not later than the 27th day of APRIL, 1895.

DURHAM.—MARCH 25.

COMPETITIVE SCHEMES are invited for the SEWAGE DISPOSAL of the District. Premiums £100 and £50 for Two Best Schemes. Mr. F. MARSHALL, Town Clerk, Durham.

BOROUGH of PENZANCE. TO ARCHITECTS.

The Town Council is prepared to receive COMPETITIVE DRAWINGS for the erection of an INFECTIOUS DISEASES HOSPITAL at a cost of about £3,000.

Premiums of 30 Guineas, 20 Guineas, and 15 Guineas are offered in the order of merit for the three plans which are adjudged by the assessor to be the most suitable.

A tracing of the site, with levels marked thereon, also "Instructions to Architects," will be supplied by the Borough Surveyor, on payment of One Guinea, which will be returned on receipt of Competitive Drawings.

The Drawings, marked with a motto or device, and accompanied by a sealed envelope containing the name and address of the designer are to be delivered at the Borough Surveyor's Office, Public Buildings, on or before TUESDAY, the 19th of MARCH.

T. H. CORNISH,
Town Clerk.

January 16th, 1895.

TO ARCHITECTS.

The Governors of the Portmadoc County School invite DESIGNS of a proposed NEW SCHOOL for Intermediate and Technical Education.

For conditions and requirements apply to

W. MORRIS JONES, Solicitor,
Bank place, Portmadoc, Clerk to the Governors.
January 19th, 1895.

MR. C. E. DEACON, architect of Liverpool, has been successful in a limited competition for new school board offices for the City; the estimated cost of the work is not stated.

We understand that Messrs. Thornton & Son, of Liverpool, have secured the contract for the superstructure of the new post office in Victoria Street, Liverpool. The amount of the contract is stated to be £112,000.

The town council of Rochdale have adopted a fair wages clause in their agreements with contractors, with the following addition to it:—"That a clause be inserted in all contracts that the contractor shall forward with the original tenders a list of the names of the sub-contractors."

The pressure reducing and regulating tank for the North Pentland waterworks has just been completed at Firhill, Craiglockhart. The tank is 112 feet square, with a depth of 20 feet, and a capacity of a million and a half gallons. The tank is built entirely of brick and cost £10,000.

The provisional committee, formed for the purpose of promoting a new line from Manchester to the North, have chosen Newcastle as their headquarters. They have also resolved to proceed with a Bill in the session of 1895.

PUBLIC Parks and Recreation Grounds are cropping up all over the kingdom. The latest is an enclosure of 17 acres of freehold land just presented to the Corporation of West Bromwich.

THE ancient Cross of Newton-on-Ayr having been unearthed, a committee of the town council are endeavouring to find a suitable site for its re-erection. Perhaps some enterprising American will eventually obtain it for his front garden.

AMONG the persons injured by the disastrous explosion of powder in the gunsmith's shop, at Darlington, on Tuesday, was Mr. G. Gordon Hoskins, J.P., F.R.I.B.A.

THE local board of Mumbles have appointed a surveyor at a salary of £130 a year. For another £5 a year they might have combined the duties of a town crier with that of surveyor.

CONTRACTS OPEN.

MIDLAND RAILWAY.

TO CONTRACTORS AND BUILDERS.

The Directors of the Midland Railway Company are prepared to receive TENDERS for the following works:—ERECTION OF SIX COAL OFFICES, WALTHAMSTOW. ERECTION OF SIX COAL OFFICES, LEYTON.

Plans and specifications may be seen, quantities and particulars obtained, on application to the Company's Architect, Cavendish House, Derby; or at the Engineer's Office, Derby Station, on and after SATURDAY, 9th inst.

Sealed Tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than NINE a.m. on THURSDAY, 14th inst.

The Directors do not bind themselves to accept the lowest or any Tender, nor to pay any expenses attending the same.

Derby, JAMES WILLIAMS,
Secretary.
February, 4th, 1895.

TO BUILDERS.

THE NEW BOARD SCHOOL, ASHFORD, KENT.
The Ashford School Board are desirous of receiving TENDERS for the ERECTION of a new BOARD SCHOOL, with MASTER'S RESIDENCE and OFFICES in Victoria road, Ashford, Kent.

All Builders who wish to Tender must send their names and addresses to Mr. H. J. JEFFERY, Architect, Ashford, Kent, on or before FRIDAY, 15th FEBRUARY next. They can obtain from him on and after TUESDAY, 19th February, on payment of a Guinea, a bill of quantities.

The plans and specifications can be seen at the Architect's Office during business hours on and after 8th FEBRUARY.

The deposit of a Guinea will be returned on receipt of a *bona-fide* Tender.

Sealed Tenders, endorsed "Tender for New Board School and Residence," must be received by me, the undersigned JAMES FRASER, not later than MONDAY, 4th MARCH next.

Neither the lowest nor any Tender will necessarily be accepted.

No. 87, High street, Ashford, Kent. Clerk to the Board.
January 17th, 1895.

TO BUILDERS.

TENDERS are invited for BUILDING VILLA RESIDENCE and STABLING at Rayleigh, Essex. Bills of quantities obtained on payment of Three Guineas, which will be returned on receipt of a *bona fide* Tender, on making application to the Architect, Mr. JAMES THOMPSON, Cliff Town road, Southend-on-Sea.

Sealed Tenders to be delivered at the Architect's Office on or before THURSDAY, the 21st FEBRUARY.

No pledge is given to accept the lowest or any Tender.
Dated January 28th, 1895.

THE VESTRY OF THE PARISH OF ST. MARY, BATTERSEA.

TO CONTRACTORS AND OTHERS.

The Vestry of the Parish of St. Mary, Battersea, are prepared to receive TENDERS for the several WORKS and SERVICES, and for SUPPLY of ARTICLES and MATERIALS, as undermentioned, for One, Two, or Three Years (at the option of the Vestry), from the 26th MARCH next—Repairs and Maintenance of Road Watering Posts.

Horse-hire,
Scavengers' Bass Brooms.
Circular " " "
Disinfectants, " " "
Bricks, Cement, Lime, Slates, &c.
Side Entrance Covers, Manhole Covers, &c.
Gravel, Flints, &c. (with the exception of Pit Flints and Fine Gravel or Hoggins).
Ironmongery.
Iron Bars, &c. for Blacksmith's Work.
Timber for Carpenter's and Joiner's Work.
Wheelwright's Work.
Coal and Coke.
Oils, Soaps, &c.
Paints, &c.

Also for the supply of Guernsey and Alderney Granite, Cornish and Enderby or Narborough Stone, the Shoeing of Horses, the Removal of Road Grit, Slop and Sweepings, and the Removal of Manure, for One Year.

Samples of the Granite and Stone (one third of a yard) and Scavengers' Bass Brooms, must be delivered at the Municipal Buildings, Lavender Hill, on or before SATURDAY, the 16th FEBRUARY at the cost of the persons Tendering.

Specifications and forms of Tender and further particulars may be obtained of the Surveyor to the Vestry, Mr. J. T. PILDITCH, at the Municipal Buildings, between the

hours of TEN a.m. and FOUR p.m. (Saturdays between TEN a.m. and ONE p.m.) and no Tender will be considered unless the same be made upon the official form, and samples are forwarded as required.

Tenders, which must be in separate envelopes, sealed, and marked on the outside "Tender for ———," must be delivered to me at the Municipal Buildings, on or before SATURDAY, the 16th FEBRUARY instant, and, with the exception of the Tenders for Oils, Soaps, &c., Paints, &c., Shoeing Horses, and the Removal of Manure, must contain the names and addresses of two responsible persons who are willing to join the contractor in a contract for the due execution of the same.

All contracts will be prepared by and at the expense of the Vestry.

Persons Tendering will be required to declare in their Tender that they pay the Trades Union rate of wages.

The Vestry do not bind themselves to accept the lowest or any Tender.

By order of the Vestry of the Parish of St. Mary, Battersea,
W. MARCUS WILKINS,
Municipal Buildings,
Lavender Hill, S.W.
January 30th, 1895.

FOR SALE.

FOR SALE, several thousand feet of PITCH-PINE TIMBER, been used as piles, 14in. by 14in., 12in. by 12in., 6in. by 12in., squared for sheet piles. Completion of contract. Must be cleared at once. Can be seen in River Lea alongside Three Mills Bridge, Bromley.—Offers to be sent to E. ILES, Tamworth Lodge, Mitcham Common. To inspect the timber please apply at 57, Three-mills Lane, Bromley-by-Bow.

STREETE. COURT ESTATE, WEST-GATE-ON-SEA.—This valuable FREEHOLD BUILDING LAND to be SOLD in Plots. The estate is situated in a most advantageous position, within two minutes of station and five minutes of sea, and is ripe for the immediate erection of small villa residences, for which there is a great demand at Westgate.—For particulars apply to Messrs. E. E. CROUCHER & Co., Land Agents and Surveyors, 76, Chancery lane, London, W.C.

The Builders' Journal.

A little more of Ourselves. WE are extremely thankful for all the good opinions, and good wishes, and good sugges-

tions showered upon us by our good friends, and as it is impossible to write personally to each one, we hope all will consider that our thankfulness is sincere. Many suggestions we are able to accept; for instance, we discard Notes and Queries, and in its place give our younger architectural friends an opportunity of making some careful studies in design, and aspiring to the gold medal and other awards which the proprietors have determined to offer. Particulars of this will be announced next week. With our third number we hope to commence a series of illustrated papers upon "Architectural London" which will be fearlessly critical but honest. We then have in preparation a series of "Architects of the past," the first of which will be the great Sir Christopher, and a clever descriptive writer of repute is collecting an interesting series of papers upon the monuments of English domestic architecture. The first of our special signed papers we also hope to publish next week.

Light Railways.

THE prosperity of building as a trade is closely allied in many ways with the prosperity of agriculture, though on the surface there may be but few points of contact between them, more especially to the superficial observer. How the institution of light railways into the country is in any measure to cope with the agricultural depression we cannot see, perhaps it is that we are unable to see, but of this we are quite sure, that if it be possible to consider this new species of political red herring to be anything but a member of the very well known family of red herrings, which is extremely prolific when some political party or the other is gasping for breath, then in all seriousness we shall want a very exhaustive and detailed statement what these light railways are to be and what they are to do. We are not going to lure ourselves into a subject which, although of much moment to the building fraternity, is hedged on either side with the brambles and nettles

of political debauchery. The deeper one goes into a matter of this description the closer one gets to the land question and the eternal discords which are hourly gathering over it. And then the details of transit, freightage, and the constitution of our railway system come in, and before you know where you are

centage of individuals is of course evident, but that they could do any material amount of good, and that as an investment of capital they could possibly return the least amount of interest material or financial, we strongly doubt. But we shall see.

GRAND STAIRCASE—IMPERIAL INSTITUTE.

you find you are back at the old mill thrashing out the same old controversial corn that your great grandfathers thrashed before you. We have no faith in light railways as a relief to agriculture. That they would benefit a per-

The Gold Medallist.

SOME little surprise has been expressed by ignorant persons that Mr. James Brooks should have been chosen as the recipient of the Queen's Gold Medal of the Institute. To us it is much more than a mere coincidence that the announcement should have been made by the President on the evening when "Simplicity in Architecture" was the subject paper. If there is a man within the four corners of England who has discovered what pure simplicity of design really is—a man, who obtains an appreciable amount of beauty from a mere massing of parts, from a boldness, and sometimes, a fearlessness of design, that man is surely James Brooks. We are not, perhaps, at the moment sufficiently acquainted with much of Mr. Brook's work to give a critical review of it, but the Church of All Hallows, which is described by Mr. Brooks himself in this issue and illustrated, is the largest, and a most typical example, of his work. We know that his particular method of design does not find favour with many of his fellow architects. Some think that in its simplicity, and in its massive boldness, there is a lamentable lack of beauty and detail, two essential qualities in Ecclesiastical architecture, but that is an opinion which no competent critic can share. For our part, we welcome his large "mass" of wall space, his fierce buttresses, his bold fenestration, and although we miss, in some instances, the rare charm and subtlety of poor J. D. Sedding, there is very much in Mr. Brooks' work which brings it far from the dead level of the stock gothic Church, with its stock spire, its stock gables, and its stock porches—Churches which—architecturally of course—sicken one so terribly in the London suburbs. We hope, a little later, to prepare an exhaustive treatise on the Church work of James Brooks, and in the meantime we may congratulate the Selection Committee of the Institute on an exceedingly honourable disposal of its Royal Gold Medal.

"The Advancement of Architecture."

PROFESSOR AITCHISON is divulging many splendid truths to his students at the Academy. The æsthetic part of Architecture is by far the most difficult to treat, as it is of the vague rather than of the clear and definite order of things, and there has been little written on the subject that is of value. In dealing with materials, for example, you can measure and weigh them; you can by experiment find their strength in compression, tension, and cross strain; you can see how much water they will absorb in a given time; and how much they will lose by a given heat in a given time. If a great number of experiments have been made, and if you have experience, you can tell, if you use the greatest care in their selection, what to allow for variation in the quality of the materials, and for bad workmanship; and if the materials are not new you can see what deterioration takes place through time and exposure, and then, if your statical calculations are right, you can be certain that your building will stand provided there are no exceptional tempests or an earthquake. By tabulating the experiments on wrought iron and steel, and by a judicious application of the laws of statics, the great suspension, tubular, and girder bridges, as well as those gossamer like structures, such as the Crystal Palace, have been built, and have not only stood, but have been the wonder of mankind. But to make structures, or parts of structures, that answer all the former purposes and move or delight the beholders as well is in quite another category. In one case you have definite and calculable forces to resist, in the other you have to touch the unknown springs of certain emotions. You can only judge what is likely to please by what has pleased, and you have to find out, if possible, not only why they have pleased, but what are the underlying principles that have made them please. If we could discover these principles then æsthetics would be a science that everyone could learn; at present it is an art that only exceptionally gifted persons can acquire by study and instinct. In dramatic literature two of the highest aims are to make the reader cry or laugh. Horace says if you want your hearers to cry you must first cry yourself; but though many treatises have been written on the cause of tears or laughter, the manner of producing these emotions has not been reduced to a science. Now those writers who make you cry or laugh are considered to be geniuses; when this art becomes a science, the producing tears or laughter will be looked on in the same light as shoeing a horse or mending a kettle. Swift, in his "Letters to a Young Clergyman" says:—"I cannot forbear warning you, in the most earnest manner, against endeavouring at wit in your sermons, because, by the strictest computation, it is very near a million to one that you have none." Perhaps that would be good advice to all who consciously seek for what is called originality which is mostly attained by exaggeration, disproportion, and oddness of arrangement; real originality only comes from original minds, and will, in that case, show itself properly and naturally, just as wit shows itself spontaneously in the witty; for surely those original Architects, who have only been able to raise in us emotions of contempt or disgust, would have been judicious had they abstained from the attempt. I think that most architectural students, if they will only study the best buildings, will make their plans to accurately answer the purposes wanted, including the efficient lighting of the rooms; will study the Vitruvian symmetry until their eye revolts from disproportion, will try and make their profiles tell the story they want told, and will try and bring such parts that, from the exigencies of the case, obtrude themselves in odd places, into harmony with the whole, that they will pro-

duce an effect which will raise their buildings to the dignity of humanity, and out of the range of the dog-kennel and rabbit-hutch type, and will not exhibit ugliness, disproportion or vulgarity. We see plenty of examples where the designs have sunk much below this level; no building of dead walls, with holes in it for doors and windows, could cause us such disgust. Let me here say, by way of a parenthesis, that if you candidly consider that your design is more offensive than a dead wall, do not waste money and materials in making the wall more repulsive, but let it alone.

THE MEDIÆVAL MANOR HOUSE.

M^R. F. W. BEDFORD delivered a lecture before the members of the Thoresby Society, in their room at the Albert Hall, Leeds, on Tuesday night of last week, on "The Mediæval Manor House: its Architectural History." He remarked that very few manor houses were built during the 12th century. The Normans built them-

needed. In the 14th century a great development took place in Domestic architecture. To this period belong the finest domestic and collegiate buildings we have, as the colleges of Oxford, Cambridge and Winchester; Gainsborough Manor House, Wingfield and Haddon Hall. The large hall still continued to be the dominant feature in the plan, but it was less used by the owner and his guests. In 15th century manor houses the first thing that struck us was that the hall continued just as before, excepting that in many cases its size had been reduced in proportion to the increase in the number of other rooms—with drawing-rooms, dining-rooms and bedrooms. Since the end of the 15th century we have made very little alterations in the plans of our country houses. During the Renaissance period—the 16th, 17th and 18th centuries—they became more formal in plan, but did not differ materially. Great improvements, of course, have been made since in the practical fittings, sanitary arrangements, heating, and so forth; but a

ALL HALLOWS CHURCH, EAST ELEVATION.

selves fortresses in different parts of the country; but the land had not been sufficiently subdivided to call the manors into existence. From what examples we had, however, we found that they were generally built on a universal plan of a large hall with a chamber or chambers adjoining, and this formed the basis on which all manor houses were built up to the end of the 15th century. The number of chambers was increased, and other alterations in their disposition took place; but still the large central hall formed the nucleus of the plan. In most examples the hall was on the ground-floor level, and was used by the owner and his followers for both dining and sleeping. Nearly all the examples of the Domestic architecture of the 13th century were built during the reigns of Henry III. and Edward I. A great many manor houses were built at this time; but they still kept the same general arrangements in plan as in the preceding century. The customs and manner of living remained the same, and so no great alteration was

needed. In the 15th century house was often quite as convenient, as comfortable, and pleasant to live in as a modern house, and generally far more dignified and beautiful. The lecture was illustrated by means of numerous ground and upper-floor plans of manor houses.

CABLE traction is cheaper than electric traction, if we may trust the report of the Chicago City Railway Company for 1894. This company has some 35 miles of cable lines, and 26 miles of overhead electric lines at work. On the cable lines the cost of working per car-mile was 9.97 cents, while on the electric lines it was 16.90 cents, or 70 per cent. more. In 1893, the cable lines cost 9.92 cents, and the electric lines 13.6 cents, showing that in 1894 the cost of working the electric lines has increased 25 per cent., while the cable lines have only increased a half per cent. The electric lines have been laid in the last few years, with all the latest improvements, and it is universally admitted that the overhead system is the cheapest to work of all the electric systems yet established.

CHURCH OF ALL HALLOWS.

THIS church is in course of erection for the newly-formed ecclesiastical parish of All Hallows, in the northern part of the old parish of St. Pancras, and is the most recent of those which have been designed by me.

The district and church were formerly known as those of the Good Shepherd, but the Ecclesiastical Commissioners, having made a grant of funds arising from the sale of the site of All Hallows Church, Upper Thames Street, for the erection of this church, and having also assigned the endowment of the ancient church to that of the newly-formed parish, its name henceforth will also be All Hallows.

The site has for its eastern boundary the Courthope Road, for its western boundary the Sherlock Road, on the north it is bounded by Savernake Road, which abuts on Gospel Oak Fields, and on the south by a piece of vacant land, on which there is the intention of erecting a parish hall.

The material with which the walls of the church are being erected consists largely of Ancaster stone, the external facing is of rag, the internal facing is a finely-chopped Ashlar, and the core of the wall is formed with Portland cement concrete. The whole of the free stone work is also of Ancaster stone.

The church consists of a nave, with north and south aisles, separated by arcades of five bays each from the nave, a south transept of shallow depth, and chancel, separated by arcades of three bays, each from the north and south chancel aisles. The south chancel aisle is fitted up as a chapel, with a separate entrance from a narrow aisle or passage-way. An organ chamber is provided above the north chancel aisle. A crypt is constructed beneath the east end of the church, advantage being taken of the natural fall of the ground to enable this to be done. The crypt contains a parish room under the north chancel aisle, a choir vestry and a heating chamber under the south chapel, and a large vaulted clergy vestry under the chancel. At the east end of the chancel are two octagonal turrets, with staircases for access to the roofs, and one of these also affords an approach to the organ chamber. At the west end are two square turrets.

The church has a very noticeable feature, inasmuch as every part is covered with stone groining, the ribs of the vaults springing from, and growing out of, cylindrical shafts, 2 ft. 8 in. diameter, the springing being 28 ft. above the nave floor level. In order to counteract the great thrust of the groining, the buttresses project 7 ft. from the external face of the wall, and are carried up without any weathering for about 20 ft., and thence have a gentle slope upwards to within about 3 ft. of the wall.

The width of the church within the walls of nave and aisles is 64 ft., the length of nave and north and south aisles is 96 ft., the chancel is 42 ft. 6 in. long, and the north and south chancel aisles are each 37 ft. long.

The accommodation is for nearly 1,400 persons, and the cost is approximately £20,000.

At the present time the walls have been carried up to the level of the tops of the window heads in north and south aisles, or about 35 ft. from the nave floor.

The contractors are Messrs. T. Rudd & Son, of Grantham, Lincolnshire.

JAMES BROOKS, V.P.R.I.B.A.

15th Feb., 1895.

PLANS for the new pier at Morecombe have been prepared. The site selected by the directors for the structure is opposite the end of Regent Road. Its total length will be 923 yards, with a pavilion situated about 250 yards from the promenade, and calculated to hold about 1,800 persons.

REGINALD STUART POOLE.

IN the death of Reginald Stuart Poole Egyptology and numismatics have lost their brightest light. Born in London, on February 27, 1832, the son of the Rev. E. R. Poole, M.A., and of Sophia Lane, a grand-niece of Gainsborough, he was brought up chiefly by his uncle, Edward Lane, the Orientalist. It was as a boy that he accompanied his uncle to Egypt, and remained with him there for seven years, during the time that his relative was accumulating materials for his great Arabic Lexicon. So completely did he abandon himself to the influence of his surroundings, that when he was sixteen he was able to contribute a series

devoted his life to the primary duty of publishing catalogues of the National Collection. The remarkable energy devoted to the medal-room did not, however, stifle the old love of ancient Egypt, which was refreshed by an archaeological mission to Cyprus and Alexandria in 1869-70. From time to time he wrote and lectured on Egyptology, and in 1882 he reprinted, under the title of "Cities of Egypt," a brilliant series of papers contributed to the *Contemporary Review*. The book was appropriately dedicated to his mother, who had written "The Englishwoman in Egypt" nearly forty years before, and who spent her last years in her son's well-known house in the Museum quadrangle in an atmosphere of filial devotion. When

ALL HALLOWS CHURCH, WEST ELEVATION.

of articles on Egyptian Chronology to the *Literary Gazette*. A couple of years later the influence of Algernon, fourth Duke of Northumberland, obtained young Poole's admission, in 1852, to the Department of Antiquities in the British Museum, and so great was his youthful reputation that he received his nomination from all the three principal Trustees, the Speaker, the Archbishop and the Lord Chancellor. In 1864 Poole made his first appearance at the Royal Institution, taking as his theme the importance of Greek coins as illustrating Greek Art. On this subject he was the pioneer. In 1866 Mr. Poole was appointed Assistant Keeper of Coins, and in 1870 he succeeded Mr. Vaux as Keeper, and thenceforward he

Miss Amelia B. Edwards conceived the formation of the Egypt Exploration Fund" she found a zealous colleague in Mr. Poole, who took a leading part in all the business of the Society, devoted his utmost energies to its success, and remained its honorary secretary to his death. When in 1885 he succeeded his old friend and colleague, Sir Charles Newton, in the Yates Professorship of Archaeology at University College, he converted what had been a chair of purely Greek archaeology into a means of general instruction in all the chief branches of antiquities, Oriental, Classical and Mediæval. The articles on "Egypt," "Hieroglyphics," and "Numismatics" in the *Encyclopædia Britannica* are from Mr. Poole's pen.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
19th February, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

MR. ALEX. H. HAIG, whose etchings of church interiors are so well known, delivered a lecture last week to the members of the Leeds and Yorkshire Architectural Society, in the Law Institute, Albion Place, Leeds. The subject of the paper was "Wisby and Gotland in the Baltic." As might be expected of an artist whose aim seems to be the delineation of the most beautiful of architectural structures, and who possesses great technical knowledge of his art, Mr. Haig had no difficulty in interesting his audience. The exhibition of his sketches and drawings on the screen also tended to heighten the interest. The lecturer first dealt with the religion, customs and legends of Gotland, an island of which Wisby is the principal town. The churches were at first constructed of wood. By-and-by those were replaced by stone buildings, but not a single entirely new church had been erected since 1411. The wall surrounding Wisby was

MOSAIC FROM THE GREEK CHURCH,
BAYSWATER.

erected during the latter half of the thirteenth century, and was, perhaps, the most remarkable work of its kind. The first wall was in the course of years heightened and thickened, and between the existing towers smaller towers were constructed. The wall was from 20 to 30 feet high, and the towers from 60 to 70 feet high. Five of the large towers contained the town gates, which had formerly portcullises and out-works. The wall was 11,200 feet in extent. In the ancient days that wonderful construction protected fifteen churches, the king's palace, and streets swarming with merchants, soldiers, sailors from all parts, priests and civilians. That continued till 1361, when the place was taken and plundered by a Danish king. The town revived after that, but the crash came in 1525, when it was stormed, and the northern part burned. Mr. Haig described the more interesting and beautiful features of his sketches, principally of churches, which were thrown on the screen.

ONE of the most remarkable incidents in connection with the present prolonged frost has been the maintenance of large traffic in the Grand Surrey Canal, between Rotherhithe and the Old Kent Road Gas Works. Other branches of the canal have been ice-bound for some considerable time, but when, a fortnight ago, there seemed every probability of the South Metropolitan Gas Company's coal supply being stopped, steps were at once taken to guard against such a disaster. Gangs of men were set to work to break up the ice between Rotherhithe and the Gas Works, and afterwards to drag it out of the canal. The Company had special implements made for the work. As a result of a fortnight of this work, the banks of the canal now present an extraordinary scene. A solid wall of ice, from 8 feet to 10 feet high and several feet wide, extends from outside the gas works to the lock at the docks. The ice wall is, it is stated, about two miles long, and several hundred men have been daily engaged in its construction. Notwithstanding the Company's exertions to keep a passage open, half-a-dozen horses have frequently had to be employed to tow a barge of coal up the canal to the gas works. The icemen are being paid at the rate of 6d. an hour, and they work nine hours a day.

We have unwittingly, and of course unwillingly, aroused the fiend in the breast of our good friend Mr. Leonard Stokes, who has taken exception to the foot note attached to the first instalment of his paper "On Observation," which we published last week. But the storm is in a very tiny tea cup. We do not quite see where our note offends, and Mr. Leonard Stokes, whom we know to be one of the best of fellows, has by this time, we hope, regained the usual serenity of his normal temperament. The whole gist of "On Observation" could very well have been contained in a column of good literature. By good we mean clever literature, and as Mr. Stokes lays no pretensions to literary culture, there is no offence there. All authors who read papers before professional societies are compelled to "fatten" their matter to make the reading of it occupy a sufficiently lengthy period of time, and that compulsion, as in the case of "On Observation," destroys a great deal of what, under better conditions, might be fairly convincing argument.

AT the last meeting of the Sunderland Guardians the House Committee specially recommended:—That the plans of the proposed new infirmary, as prepared by the architect, be approved; that the front administration block, two pavilions, corridors, maternity pavilion, probationary pavilion, laundry and boiler house, and mortuary be erected (leaving the kitchen and staff apartments on male and female side to be erected at some future time), at the estimated cost of £34,725; that application be made to the Local Government Board for power to borrow a sum not exceeding £35,000, to be repaid in thirty annual instalments of principal, with the interest on the balance remaining each year. The Chairman explained that, under pressure of the Local Government Board, the Guardians were compelled to erect an infirmary. In the competition the plans of Mr. J. Shields were accepted. They would cost £50,000 to carry out. Owing to the depressed state of trade, it was necessary to restrict the expenditure to £35,000. The recommendation was adopted.

In connection with the last meeting of the Old Edinburgh School of Art, Mr. G. H. Capper read a paper on "Holyrood Abbey." Mr. J. R. Findlay, the chairman, at first expressed regret that the Royal apartments in Holyrood Palace, which had very considerable

architectural interest, were not open for public inspection. Many of the Royal palaces abroad were so open, and at Windsor the State apartments were regularly shown to visitors, except when the Queen was in residence there. He could not see why the rooms in Holyrood Palace should be closed except to a few favoured people who were invited as guests by the Lord High Commissioner. If the members of Parliament for the city and the municipal authorities exerted themselves a little, the rooms, he thought, might be opened to inspection by the public.

BY A. B. MITCHELL.

He would never for a moment expect to see through Balmoral, or any private residence of the Queen, but Holyrood was not a private residence of the Queen, but a palace belonging to the people. Further, he thought that the gardens at the palace ought to be opened up, and people allowed to walk there. In London thousands of pounds were spent on the Royal Parks every year; a couple of hundred pounds would keep the Holyrood Gardens in order, and they would be a delight to thousands of people.

MR. CAPPER eventually explained that he was to deal with Holyrood Abbey as distinct from the palace, and showed, with the help of limelight illustrations, how fragmentary were the remains of the original building. He afterwards had thrown upon the screen pictures of a number of well-known ecclesiastical buildings in England, with the view of conveying to the audience some idea of the parts of the abbey church that have been swept away. In reference to the history of the church, he recalled the legend of King David and the stag, but pointed out that it was not till after the year 1400 that mention came to be made of it in connection with the foundation of the abbey. Mr. Capper subsequently spoke of the leading characteristics of the building from an architectural point of view, incidentally saying that he shared the hope of the Chairman, that the palace gardens would soon be open to the public; and, in concluding, he reminded the meeting that two districts of the city owed their names to the existence of the Church of Holyrood—the Grange, which came to us from one of the barns erected by the clergy of the abbey in ancient days for storing their tithes of corn: and Canonmills, so called because there was situate in the old days, on

the Water of Leith, a mill for the grinding of the corn of the Canons of Holyrood. The lecture was made the more interesting by reason of the series of beautiful views which were shown on the screen in illustration of the subject.

THOMAS ALVA EDISON, the electric wonder of the century, was born in Ohio on February 11th, 1847, of Dutch parents. At the age of fourteen he achieved a stroke of enterprise which the newspapers have often exploited. When the news came of the battle of Pittsburg Landing he was a newsboy on the Grand Trunk Railway, and he wheedled the telegraph operators into giving him the use of the bulletin boards at the various stations for announcing the news in advance; then he cajoled the editor of the *Free Press* out of one thousand copies of the paper to be paid for after being sold; and finally he persuaded the engineer of the train on which he started out to give him a few minutes' extra time at each station. The result was that every station along the route looked as if a riot were in progress; so big was the waiting crowd that the price of the papers went up to twenty-five cents a copy, and a small fortune was garnered in.

It was a short time after this that Edison came near burning up a train with his precocious scientific researches. He had gathered together a sort of laboratory in the car in which as newsboy he made his trips. The car was destitute of springs, and, like the "one-hoss shay" of immortal memory, was in a complete and consistent state of decay. The constant jolting dislodged the cork of a phosphorous bottle, hurling it violently to the ground and setting fire to the car. The flames were extinguished without much difficulty, but the wrath of the guard was less easily allayed. He was inclined to view Edison in the light of an unmitigated nuisance rather than in that of an interesting and incipient genius. The present crowning outrage gave him the revenge his soul had thirsted for so long, and in the twinkling of an eye our luckless hero found himself on the platform with his scientific gods raining about his ears. The boxing which the angry guard administered to the boy's head, before ejecting him, resulted in the deafness which has ever since afflicted him.

His next feat was to construct a telegraph line from the town of Port Huron to the railroad station, but about the time it was completed a courageous rescue of the child of the telegraph operator led to Edison's installation as an assistant in the office. Edison here started on the continuous upward career which is well known to the world, and some of the results of which are his automatic telegraph system (by which one thousand words a minute are sent over a wire from New York to Washington), the electro-motograph (out of which came the transmitter of the telephone), the megaphone (making audible six miles away the sound of cattle crunching grass), the aerophone, the phonograph, the incandescent light, &c.

HERE is Mr. Edison's own story concerning the discovery of the principle of the phonograph:—

"I discovered the principle by the merest accident," states Mr. Edison. "I was singing to the mouthpiece of a telephone, when the vibrations of my voice sent the fine steel point into my finger. That set me thinking. If I could record the action of the point, and send the point over the same surface afterward, I saw no reason why the thing should not talk. I tried the experiment first on a strip of telegraph paper, and found that the point made an alphabet. I shouted

the words 'Halloo! Halloo!' into the mouthpiece, ran the paper back over the steel point, and heard a faint 'Halloo! Halloo!' in return. I determined to make a machine that would work accurately, and gave my assistants instructions, telling them what I had discovered. They laughed at me. That's the whole story. The phonograph is the result of that pricking of a finger."

AN important case of considerable interest was heard the other day in the Clerkenwell County Court, by Judge Meadows White, Q.C. The New Imperial Investment Society sued Mr. Hilburn for £31, being the sum required to repair a house he occupied from them at New Malden. The defendant had no lease of the premises, but only a three years' agreement, and he paid £10 into court as the full value of any deterioration that might have occurred during his tenancy. When he left, the plaintiffs sent their surveyor to inspect the premises, and he prepared a specification which would cost £31. The defendant was then called upon to do the work, but he refused, and in his evidence he gave his reasons. In the first place, a good

CORNER OF BARNARD'S INN.

deal of the damage it was now sought to make him repair was caused by the inferior material originally employed, the plaster of the walls being simply mud. He further said that the holes in the ceilings were caused by rats, of which there were a great many in the house (upwards of forty being caught in one week), and by damp caused by defective waterpipes. His honour, in summing up the case to the jury, said the plaintiffs relied upon the following clause in the agreement: "The tenant agrees to keep and deliver up the premises on quitting in as good a state and condition as the same are now in." His honour directed the jury to put a reasonable construction upon these words. Had the tenancy only been for one year it could hardly mean that the paint should be renewed, the walls repapered, and the whole house put in exactly the same condition as it was when the tenancy commenced. The jury thought the £10 paid into court was sufficient, and his Honour gave judgment for that amount.

M. BOUTAN, of the Sarbonne, who is well known for his submarine explorations, has found a means of photographing the seas bed. Provided with a water-tight apparatus of his own construction, he tried at first with natural light, but an infinitely long exposure was necessary, and then it was only possible to obtain a negative in exceptionally calm weather. He then invented a lamp, a bottle filled with oxygen and surmounted by a glass bell in which burned a spirit lamp. Magnesium powder is projected on to the wick by an india-rubber spray producer, and the resultant burst of flame affords the light for an instantaneous exposure. The base of the machine is pierced with holes so that as the oxygen diminishes it is replaced by water, thus equalising the pressure without

MOSAIC FROM THE GREEK CHURCH BAYSWATER.

and within. This prepared and weighted, M. Boutan, in diver's dress, quits his boat in search of the picturesque. He has obtained some striking pictures at the bottom of a bay near Banyuls, at the mouth of a small stream. As soon as the beach sands are quitted, boundless meadows of seaweed are encountered, reaching to the breast of the submarine tourist and extending in a gentle slope to the invisible depths. The currents from the stream have ploughed this green lawn, tracing highways here and narrow paths there, carpeted with fine sand and minute shells. These Mediterranean boulevards have their flâneurs in the shape of large crabs, who strut along, all unmindful of the danger awaiting them, although they might take warning by the heap of carapaces at every turn of the road under every rock. If they approach these repairs too closely, a viscid arm is stretched forth which embraces and crushes them. It belongs to the polyp, which too awkward to catch the more agile-finned things, gluts its appetite with a perpetual feast of crab. These octopods abound, but luckily for the photographer, they are not large. Surprised in their retreat, they put themselves into a posture of defence, their tentacles outspread. Teased by a cane, they prefer flight to battle, and disappear awkwardly among the weeds, disturbing the lazy congers who are digesting heavily. A burst of sunshine extends the observer's field of view, and reveals shoals of sea-bream and mullet pasturing in the meadows. The boat shows like a patch of ink on the luminous ceiling. It is the moment for a negative. The first flash of the magnesium attracts crowds of fish, who sail around the explorer in astonishment, but not in fear. If he stretches out his hand to seize one, it moves out of reach of his arm, but no further. Photography, which has revealed the heavens, has now a new field. We shall, probably, soon have collections of submarine views in addition to those of mount and stream. But ingenuity will not stop there. It will not limit itself to the shallows that can be reached by the diver, but, doubtless, means will be found to send the submarine camera by itself into the depths to bring back for us pictures of that which the eye of man can never behold. M. Boutan has found new work for that invaluable handmaid of science—photography.

IN an article on the "Fortunes of Lambeth Palace," Mr. William Connor, Sydney, gives an interesting account of Lambeth Palace. "In 1648," he says, "it was put up for sale, and was purchased for the sum of £7,073 os. 8d. by Thomas Scot and Matthew Hardy, the former of whom was Cromwell's Secretary of State, and one of the Judges who had presided at the trial of Charles I., and who, it may be added, paid the penalty of his conduct on that occasion in 1660 with his head. The miscreant regicides no sooner obtained possession of the residence of the Archbishop of Canterbury than they proceeded to wreak their vengeance upon everything that offended their bigoted minds. The first object of their destructive hands was the noble hall, the work of Cluchite, which they pulled down, and the *materiale* of which they sold. As if to signalise the gross inconsistency which existed between their practice and their preaching, they had the audacity to convert the beautiful chapel into a dancing room, and finally completed their work of destruction (and it is to be hoped satisfied their "Godly zeal," by which we will in charity assume they were fired)

BY A. B. MITCHELL.

upon the tomb of the Venerable Archbishop Parker, which, because it stared them in the face and checked their mirth, they saw fit to shatter in a thousand pieces. Impelled by a ghoulis curiosity, these monsters of debauchery dug up and opened the leaden coffin. Cutting away the cere cloths, of which there were many folds, they exposed the corpse, which had not then seen corruption, and, after stripping it, conveyed it into an outhouse, and there buried it among the offal. It is satisfactory to record that in 1661, the year after Charles II. was restored to his throne, the wretch Hardy was ordered by the House of Lords to exhume the mortal remains of the Archbishop, and after they had been re-interred with befitting solemnity and honours, in the same chapel near the steps of the altar, to erect a handsome monument over it at his own cost and charge.

WHEN Lord Elgin removed Phidias's work from the Parthenon, a cry of horror went up from the entire cultured world, Byron—who, curiously enough, at one time lived next door to Lord Elgin, in the house now divided into

two, and occupied by Mr. Ernest Beckett, M.P., and Sir Algernon Borthwick—being the loudest in his abuse of what he called his lordship's "stone-shop." But, considering that at that time Athens was in the hands of the Turks, who had battered the Parthenon to pieces with their cannon, and were burning its marble to convert into lime; Lord Elgin was not such a Vandal as the world made out. After unheard of adventures, they were wrecked and fished up from the bottom of the sea. The Elgin marbles were eventually sold to the nation at a loss to Lord Elgin of some £16,000 or £20,000. Of late years there has been a foolish revival of the Vandal theory of our possession of these precious relics of the noblest period of Greek Art.

THIS winter's gales will long be remembered in England, but one in particular will be recalled most vividly on the Norfolk coast, where its full terrific force was experienced. Indeed, the whole country suffered, and Eccles especially so, for it has lost a cherished heirloom not to be adequately restored. The round steeple which has stood for so many years on the open beach, defying storm and sea, has gone at last. Hour after hour the hurricane beat without effect upon this venerable pile, but at last the old tower succumbed, and now it has fallen. Of all the erection but four or five feet alone remain, and the storm which has destroyed a part of the ancient building is also responsible for revealing other portions long hidden beneath the sand. The outlines of the southern aisle have been uncovered, and are now to be clearly distinguished. Eccles Church was dedicated to St. Mary some hundreds of years ago, but the sea has made tremendous inroads upon this coast, and the holy building, with the exception of its tower, was partly destroyed and buried as far back as 1605. The tower itself was circular at its base, octagonal at the summit, and about eighty feet in height. With it a famous sea-mark has disappeared.

THORESBY HALL, on the edge of Sherwood Forest, where Earl and Countess Manvers are entertaining a large party this week, is one of the most interesting of the stately homes that go to make up the Dnkeries. The present Elizabethan house is not indeed, ancient, having been built by Salvin early in the present century, but it occupies not unworthily a site that the Pierpoints first settled upon at the time of the Conquest. The ancient mansion must have been a splendid affair, for it is described as having window frames overlaid with gold, but this magnificence gave place to a very plain brick structure, the birth-place of Lady Mary Wortley Montagu, and in 1745 a fire destroyed the then existing edifice, making room for a nobler building erected by the late Duke of Kingston. One of his predecessors, known as "the good Earl of Kingston," met with a very remarkable fate. During the great rebellion he pursued the tactics familiarly described in America as "sitting on a rail." Upon Cromwell's pressing him to join the Round-heads, he exclaimed! "When I take arms with the King against the Parliament, or with the Parliament against the King, let a cannon ball divide me between them." A few weeks later he decided to cast in his lot with the Cavaliers, was taken prisoner by Lord Willoughby, and shipped off to Hull. Some of his own party attempting a rescue, brought a gun to bear upon the vessel, and at the first shot cut the luckless Earl in twain. The present Lord Manvers does not hesitate between two opinions. He is a staunch Conservative, and will keep both himself and the Empire undivided to the best of his ability.

THE name of Goodwood is very ancient and is supposed to be a corruption of the

Saxon name Godwine. The estate was purchased from the Compton family by the first Duke of Richmond in 1720. The modern

MOSAIC FROM THE GREEK CHURCH, BAYSWATER.

house is built on the site of an old gothic building, which was demolished in the early part of the eighteenth century. It consists of a front 160 feet in length, ornamented in the centre with a double colonnade, and terminating at either end with a round tower, from each of which a wing juts out at an obtuse angle. It was begun by Sir William Chambers, and added to by Wyatt, the architect of Windsor Castle, under the orders of the third duke, who intended originally to complete the hexagon, but only succeeded in finishing the three sides now existing. The whole building is composed of stone flints of the neatest masonry. The stables, which were designed by the architect of Somerset House, are quadrangular in form and are remarkable for their size, the front measuring 213 feet by 146 feet.

MR. T. RIDYARD ROSCOE, C.E., of Luton, has been appointed, by a large majority of votes, surveyor and engineer to the Vestry of St. Leonard, Shoreditch, at a commencing salary of £300 per annum. Mr. Ridyard Roscoe has held the position of borough engineer and surveyor to the Town Council of Luton for the last three years, and previously he was engaged as assistant surveyor to the local authorities at Islington, Hammer-smith and Ramsgate. In 1882-1883 he was employed by Mr. (now Sir) E. Leader Williams, M.I.C.E., upon the engineering staff of the Manchester Ship Canal.

IT was the same expensive third Duke who built Molecombe in 1761, and planted the Lebanon cedars which are still the chief features of the fine park, though only 150 now remain. The most striking object of the interior is a colonnade of six pillars of light grey granite which adorns the entrance hall. The walls of the drawing-room are hung with Gobelin tapestry, representing the adventures of Don Quixote. The house contains a whole gallery of historical portraits, including Charles I. and Henrietta Maria by Vandyck, Charles II. by Lely, Louise de Keroual and Charles, first Duke of Richmond, by Kneller. The most remarkable picture is one in the billiard room, which was brought from the Castle of Aubigny. It contains a complete representation of all the incidents in the murder of the Earl of Darnley. The artist is unknown, but the picture is said to have been painted in the reign of James I., and finished in four months.

THE town council of Bury, Lancashire, has decided, after a long discussion, to empower a committee to obtain plans for the erection of a municipal lodging house capable of accommodating 300 persons. Intending competitors should visit Lord Rowton's model institution at Vauxhall, the finest and most successful of its kind in England.

ANNOUNCEMENTS.

Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

THE EDITOR does not hold himself responsible for the opinions of Correspondents, whose communications should be brief and plainly written on one side of the paper.

The BUILDERS' JOURNAL goes to press on Monday at 6 p.m. All matter must reach the Editor by the first post on Friday morning to ensure its treatment in the current issue.

Publishing.

The terms for free post Subscription to any part of the United Kingdom is SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments. Subscribers in London or the Suburbs receive their copies by the first post delivery on the day of publication.

Advertising.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS WANTED.

Per line (about 10 words), Sixpence.

Minimum charge, Eighteenpence.

Three Insertions for the price of Two.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE AND GENERAL ADVERTISEMENTS.

Four lines (about 40 words), Three Shillings.

Each additional line, Sixpence.

Prepayment in the above Advertisements is absolutely necessary.

The charge for Paragraph Advertisements on the Front Page is Fifteen Shillings an inch, single column. Minimum charge, Five Shillings. Paragraph Advertisements on ordinary page, single column, Seven Shillings and Sixpence per inch.

MANUFACTURERS' ANNOUNCEMENTS ON ORDINARY PAGES.

Per Page, Single Insertion, Eight Guineas.

Discounts for series on application to the Manager, who will make Special Contracts for Announcements on Back and Leader Pages and positions facing matter.

NOTICE.—Advertisements for current week's issue are received up to last post on Saturday. Alterations in standing Advertisements must be made before 6 p.m. on Fridays.

Advertisers in THE BUILDERS' JOURNAL may have their replies addressed to the Manager's Office, free of charge, and may have them forwarded if addressed envelopes sufficiently stamped are sent.

Reading Cases, lettered in gold, may be had from the Manager. Price, One Shilling.

Talbot House, Arundel Street,
Strand, W.C.

THE enterprising Corporation of Blackpool have decided to purchase, at a cost of £32,000, three large estates to the north of Claremont Park, for the purpose of constructing a new promenade and carriage drive, with a view to adding an extensive suburb to the town.

THE Hammersmith Vestry have under consideration a proposal to construct a new lock at Battersea. It is said, that since the construction of the Richmond Lock and the erection of the Tower Bridge, the flow of the river has decreased so much that navigation is rendered almost impossible near Hammersmith.

The Builders' Journal.

MEN WHO BUILD.

No. 2.

MR. THOMAS COLLCUTT.

LOOMSBURY has become, by the natural evolution of things, an architectural haunt, but it has been left to Thomas Colcutt to build himself a habitation which does credit to his own art, and to a district wallowing in the refinement of stucco, and an abundance of those alarming classic details which are peculiar to the Italiano Portland Cemento period of London architecture. Mr. Colcutt pulled down one abomination in Bloomsbury Square and built up a delightful home, albeit the wretched London atmosphere has already played sad havoc with much of the rubber work, to the porch and string courses of his house.

Thomas Colcutt first entered an architect's office where he was "bound apprentice" to one, Armstrong, of London, a gentleman who—however clever he might have been—has been eclipsed by his pupil. He then journeyed to the office of Messrs. Miles & Murgatroyd—and, lastly, he went over to the ever lamented G. E. Street, and imbibed the Gothic feeling, which, curious to notice, has had very little to do with his purely architectural work, although for years it influenced all the furniture designing which he did. In 1869, Mr. Colcutt commenced his practice in partnership with a Mr. Woodzell, and this partnership was responsible for the Blackburn Free Library, a fine work. The partnership, however, existed but for three years, and then the senior member started on that series of delicate and reputed renaissance studies, the first of which was the Wakefield Town Hall, which have brought him renown and fortune. Mr. Colcutt has carefully journeyed, sketch book in

hand, through France and Normandy, Belgium and Holland, but particularly studying the Italian Renaissance that one finds in and around Orleans. And under this influence all Mr. Colcutt's later work has been moulded. For years he worked assiduously designing furniture for Messrs. Collinson and Lock, first in the Gothic methods which were fostered by Street, then gradually becoming more and more infatuated with the best of the French periods. This is a branch

of design which Mr. Colcutt has always excelled in, and to this day he is responsible for the internal fitting up of the P. & O. liners, which, travellers will remember, are extremely ornamental in their saloon and stair-case fittings.

During more recent years, Mr. Colcutt has been responsible for the elevation and internal decoration of the new Palace Theatre, Mr. D'Oyly Carte's fine house in Shaftesbury Avenue. The fine front of the P. & O. Co.'s

Offices in Leadenhall Street; the City Bank on Ludgate Hill, one of the most reputed and delightful pieces of design in the whole of the City; the new King's Hall of the Holborn Restaurant; and, lastly, the Imperial Institute, which, from its magnitude, may by many be looked upon as the masterpiece of Thomas Colcutt, but of that the Architect himself may have something to say.

"Perhaps," he suggests naively, "I might like to pull it down and build it up again," and, although there appears to be little seriousness in the suggestion, it is the opinion of many that had more time been given to the Architect to mature his scheme and to elaborate his design, he would have been less ornate in his detail and would have put a deal more serious effect and grandeur into the work. One thing Thomas Colcutt is extremely anxious should be remembered, is that internally nothing hardly has been completed owing to the want of funds. The whole

UPPER PART OF EAST AND WEST WINGS.
IMPERIAL INSTITUTE.

cheme of completion depends upon colour decoration, so that it is impossible to be fair in criticism until the artist has had the opportunity of adding the wonderful effects of colour to his building. Mr. Collcutt's own description of this picturesque pile is worth giving. "The prevailing style of the building is a free rendering of the Renaissance, and as the amplitude of moulding and the abundance of Arabesque carvings show a decided relationship to early Italian Renaissance, it may be said that the Imperial Institute affords a characteristic example of the gradual movement towards the Renaissance, as practiced in this country during the last two decades."

A little item of Mr. Collcutt's work is a curious instance of how a really unimportant fact will sometimes give more honour to a man than his greatest efforts. The fame of Thomas Collcutt will never fade so long as his remarkable "front" in Fleet Street is able to show anything of its charms from behind the damnable advertisement boards of Lockhart's Cocoa, which at present smother it. The history of this little front is interesting. The building was formerly the show-rooms of Collinson & Lock, for whom at that time Mr. Collcutt was designing furniture. The front was too good to pull down, but too hideous to keep standing, and so Collcutt determined to introduce a few strings and cornices in red rubbers and cover the panels with Portland cement. It was in the depth of winter, twenty years ago, that the work was begun. The scaffold was lined round with canvas, and braziers were kept continually burning behind the screens night and day, to keep out the frost. A certain young Artist—now gone to America—named Wilberfoss, who at the time was designing wall papers for Jefferys and other makers, undertook to "do something" to the bald and unconvincing panels of cement, and so, with his own hands and with a few moulding tools which he made for the purpose, he moulded that cement and left it as we see it now. When the whole had set and the braziers and the canvas screens were removed, London had become, in a few weeks, the possessor of as fine a piece of honest work, and as charming a London front, as under corresponding circumstances it is ever likely to possess.

Seated in a particularly charming room, in Bloomsbury Square, and which has the touches of an Architect's hand upon it, from the skirting to the cornices up above, you are able to indulge in a little cursory chat about the date books of the past and the aspirations of the future. Mr. Collcutt is not prepared to go very deeply into the question of professional examinations, but as one of the Institute Examiners in the "Art" section he frankly confesses that the Examinations are after all proof of very little. The great

objection to the whole thing is the custom of cramming, and as he very rightly remarks, the more a brain is crammed the quicker does its knowledge evaporate. He gives you instances in which men have creditably passed the Institute Examination who would have been mercilessly plucked had they again attempted the same examination three weeks later. Mr. Collcutt, however, ridicules the notion that an Architect should be an artist and nothing else. The more practical knowledge a man has, the more likely are his

inlay is remarkably fine, and the original locks of beaten iron are still in position. Beside a Gothic cabinet, an example of his own design of 20 years ago, there stands a beautiful muniment chest, massively inlaid with ivory, which the owner picked up upon one of his Italian travels. A few specimens of beautiful pottery ware, of which he is an enlightened connoisseur, evidence his appreciation of the plastic arts. But those of us who have seen some of his internal decorations and fittings, know what a mastery his pencil has over this

department of an Architect's Art. He is at the present moment engaged upon an important restoration of a fourteenth century country house. With his clerk of the works he is personally superintending the work without the aid of the contractor, and the delight with which he gives you a few of its details, and the interest you know he is taking in the restoration proves that, in Thomas Collcutt, English Architecture possesses a practitioner who brings the utmost refinement to bear upon every atom of work his pencil produces, and there are those of whom so much could not with honesty be said.

A MOVEMENT has been on foot for some time past to establish public swimming-baths for Sittingbourne, but the chief obstacle to the adoption of any scheme has been the question of finance. The difficulty has, however, been solved by an offer from a firm of manufacturers in the town, to give £1,000 towards the scheme on the condition that the baths, when complete, shall be handed over to the Urban District Council to be maintained by that authority for the benefit of the public. It is proposed to utilise the baths as a gymnasium as well.

MR. DE RUTZEN decided, at the Westminster Police Court, in the case of the erection beyond the general line of frontage at the Westminster Palace Hotel, Victoria Street—the construction without the consent in writing of the London County Council of a conservatory over the portico—that the structure was illegal, and must come down. Mr. Chilvers prosecuted for the County Council, and obtained an order in their favour with costs.

H. M. OFFICE of Works has purchased a vacant plot of land, facing Baldwin Street, from the Bristol City Council for £4,220. The site is required for the erection of new Bankruptcy and Inland Revenue Offices.

To clear a site for the approaches to the Blackwall Tunnel, it has been necessary to pull down a large number of buildings, especially on the north side of the river, where the approach begins in the East India Dock Road, opposite the principal gate of the Import Dock. The claims for land, buildings, &c., amounted to £432,000, but they have been settled for £317,000. At certain points near the river there will be spiral staircases, in shafts, so that the people in the neighbourhood may enter or leave the tunnel without going along the incline to the ends of the approaches.

THE QUEEN'S TOWER—IMPERIAL INSTITUTE.

artistic faculties to be elevated; and the better acquaintance he has with the workshop and the scaffold, the nobler will be his buildings and his reputation. In his own room, in Bloomsbury Square, and in his country house, Mr. Collcutt is surrounded with the evidences of a cultured brain. There is a superb marqueterie cabinet of enormous proportions which occupies one whole side of the room. It was brought from the monastery of Rottweil, near Ulm, in 1526, where it was made by Capuchin monks. The

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

"COUNT me against Architectural Confectionery and fidgety facades," was what Walter Crane begged in his telegram of excuse for non-attendance at the last meeting of the Institute.

Before the papers upon "Simplicity in Architecture"

were read it was announced by the President, Mr. F. C. Penrose, M.A., who occupied the chair, that the Council had selected the name of Mr. James Brooks for submission to Her Majesty as a fit and proper recipient of the Royal Gold Medal of the Institute, for his works as an architect.

MR. JAMES BROOKS.

Mr. Halsey R. Ricardo first read his paper and opened his remarks by quoting Ruskin: "Architecture is the art which so disposes and adorns the edifices raised by man, for whatsoever uses, that the sight of them may contribute to his mental health, power, and pleasure." He stated that "all architecture proposes an effect on the human mind, not merely a service to the human frame." And we knew that these words were true. This effect might be the expression of the individuality of the architect, or the owner of the building, or a fusion of their associated individualities. Mainly it was the architect who spoke through his work; the building-owner set him the conditions, but their resolution was his occupation. In architecture, man's individuality was swiftly discernible. Let not a man think to conceal his identity; a moulding betrayed him; the preparation for a cornice or the stopping of a string-course proclaimed him. Living architecture was that which answered the requirements of the day. The requirements might be modest and sensible, and then the architecture would be beautiful and strong; they might be affected and individual, and then the architecture would be so far paralysed; they might be extravagant and vulgar, and the architecture would be violent and vulgar in response. Early in the century we threw off the weight of 300 years, and masquerading as Perpendicular Goths, went about our business of the day. Then some very superior people shook off a couple more centuries, and attempted to play at being knights out of armour. Time, the policeman, moved us on, and we proceeded to play just round the corner. The 150 years or so seemed a bridgeable difference, and Christopher Wren, a good serviceable stock on which we could graft what of Italian, Dutch, German, or other, we might choose. And at this point we were now arrived. The whole past was a vast treasury for us to draw upon. But this wide range of choice had been attained with the loss of tradition. And this want of traditional support had had the result of clogging and obscuring the architect's mind with detail. The traditional methods had been obliterated; but there was a strong tendency to adopt the opinion that detail would pull one through, even if one could not get the masses right. A short while ago the Terrace in High Street, Kensington, came into the hands of the builder. The buildings, low and out of date, stood back from the road, and their reticence did something to counteract the unpleasant constricted feeling that one had in the High Street. The houses were pulled down, and a large block erected on the advanced frontage. The ground floor built in the "practical" style—brick party-walls, some steel knitting needles, and some sheets of plate-glass; above this, four

stories of domestic architecture in the style of "the man in the street." The building was curiously illustrative of the temper of the day. It was devoid of proportion, and covered with knick-knacks and the general frippery of architectural ornamentation. Across the road, and forming its north side, were two blocks of buildings, called Lower Phillimore Place. They were not conspicuous examples of good proportion, but they were simple, quiet, and refined. They looked with scorn at the blazing vulgarity of the new corner opposite. Seventy years ago we should have called them builders' houses of a good type; to-day we call them dull. Buildings, like the drama, should be pregnant—condensed—in their ornamentation. Simplicity in architecture meant good art in architecture, and good art in architecture meant perfect adaptation to the circumstances surrounding it. Good art was, therefore, pre-eminently practical. All this welter of indiscriminate ornament was not practical.

Mr. Basil Champneys said he had been asked to speak on the subject of Simplicity in the Art of Architecture, specially with reference to churches and country houses; though the principle of simplicity was really universally applicable to all architectural art whatever. There were two positions which it was desirable that we should establish in the first instance: the one that simplicity was a note of the highest art everywhere and in all its branches; and the other, that it was specially characteristic of the English genius. In the fourteenth century, when foreign art was developing into the vagaries of the Flamboyant in France and the neighbouring countries, and in Germany into a variety of ingenious extravagancies, in England the invention of the Perpendicular held eccentricity in check and resulted in work which erred as often on the side of severity as of exuberance. A work such as the Chapel of King's College, Cambridge, with all its elaboration and extreme development of constructional art in its vaulting, was still essentially one of the simplest, as it was one of the grandest, of Mediæval buildings. If such a work as Henry VII.'s chapel be quoted against him, he should answer that, beautiful as it was, it showed the note of decadence, and was evidence only of the exuberance into which art might run when the restraint of a wholesome traditional principle was removed. But, putting aside these more conspicuous examples, one could appeal with even greater confidence to the vernacular examples of ecclesiastical art, to the dignified modesty of thousands of village churches of no special fame, all of which, almost without exception, showed unobtrusively some note of true inventiveness and some degree of poetic charm. An idea was unfortunately prevalent that simplicity in art was usually to be found in an inverse ratio to inventiveness. He believed that the exact opposite was true, and that if necessity was the mother of invention, simplicity was daughter of inventiveness. From first to last the law held good, that every building, to be a work of art, must originate in one central idea—what the French called the "*idée mère*"; that to this idea all that the inventive powers might evolve must be strictly subordinated, and that it was better to apparently fail in inventiveness than actually to fail in unity and keeping. The popular demand for so-called originality was perhaps the most dangerous influence against which the art of the time had to struggle; nor was it more noxious than absolutely unreasonable. True inventiveness was always unconscious; nor could anyone by taking thought increase his originality one whit more than he could add a cubit to his stature. No art had ever progressed by jerks; healthy progress had always been smooth, gradual, and tentatively modest; and this was especially true of architecture, which could never be largely divorced from precedent, and relied so largely for its effect on associated ideas. Style had been defined by someone

as "having plenty to say." It would be more correct to say that one of the essential conditions for writing a good style was to have plenty of material; perhaps another condition might be not to try to say too much. These remarks had a very direct application to the question of architectural simplicity. Architecture, of all the arts, was the most firmly based on the practical. In the design of every building the primary problem was to fulfil certain definite practical requirements according to established constructional laws, and it was on the spirit in which such problems were met that style in architecture mainly depended. If they were met honestly and simply, the thing to be done being held primarily in view and sound laws of construction loyally obeyed, at least the conditions of good architecture were present. In architecture, unity and simplicity were so closely allied as to be almost interchangeable terms. But the only condition on which true and complete unity in architecture could be obtained was that the design should have been originally conceived as one complete whole. One often came upon proposals which seemed to imply that a design might be taken to pieces, and that the elevation was to follow a plan previously and independently made. This was a dangerous heresy. A plan was a good plan if, fulfilling the primary practical requirements of the scheme, it involved by legitimate construction a building both internally and externally good. Unity of effect involved and implied unity of conception.

Mr. Francis J. C. Penrose, in a short paper on

ORNAMENTAL SCREEN, MAIN ENTRANCE.

the same subject (read by Mr. Caröe) said that in an age of such varied and complicated wants as the present, the primitive simplicity of our Norman and Saxon ancestors could not be maintained, nor would it be, to that extent, desirable. Every historic style of architecture had passed through the phases of its first uneducated dawn, then its meridian excellence, and thence had sunk to a more or less complete state of decadence. There has been a rude but grand kind of simplicity in the first period; then the well-ordered and chastened simplicity of the culminating stage, and invariably a loss of this quality at the close. But, nevertheless, in England at least, a resolute stand was in some very important instances made against the prevailing tendency to complication. Witness the works of William of Wykeham, in Winchester Cathedral and elsewhere, and of the Architect, whoever he was, who built King's College Chapel. A noble stand was also made against the degeneracy of the Renaissance in England by Inigo Jones and Sir Christopher Wren, and in France by Claude Perrault in the Eastern front of the Louvre. Besides these examples of stemming the adverse current, we had encouragement derived from the sequence of the works of nature. Consider the gradation which we found between the pendant violet and cowslip of spring, the severe concentric majesty of the summer rose, and the radiating flowers of autumn; but none of these, with all their variation of character, could we charge with want of simplicity. The examples and analogy above given ought to encourage us to feel

assured that even though a tendency adverse to simplicity had become prevalent, it was quite capable of being corrected. Let us, therefore, endeavour to establish the means by which it might be done. A prime essential was the rule that no particle of ornament, whether decoration be abundant or scanty, should be used without a definite aim. Let us next consider the advantage of a well-ordered and simple plan. One of the greatest charms in viewing a building arose from the exercise of the mind, when the orthographic aspect was distorted by perspective, in recovering the true shape or plan from the image presented to the eye. In a well-balanced architectural composition, this process could be gone through satisfactorily before the mind was fatigued by it. As to the quality of simplicity in the orthographic aspect, the first principle should be the expression of one central idea connected with the purpose of the building; and any subordinate compositions should have reference to the main idea, and by far the larger part of the ornamentation used should be grouped in connection with it. It might be instructive to point out how very little some of the finest works of architecture owe to complexity of structure and ornament. In the Propylæa there was no ornamental carving whatever. Our two noblest cathedral fronts, Lincoln and Peterborough, owed their imposing and beautiful effect to simple forms. The Sainte Chapelle looked far more impressive when he first saw it, with the windows and floor quite plain, than after its modern elaboration with paint, gilding, and tiles. Taking for granted the desire to work out a design in due simplicity, the method which had occurred to him was something of the following nature. Having well thought out the capabilities of the plan, commence the elevation on quite a small scale—such, for instance, as the object would appear at a distance equal to ten or twelve times the height. On so small a scale none but the principal features would be distinct. Sketch these into shape before any enlargement of scale was thought of. Then adopt scales representing the building at nearer distances by steps, until the scale was sufficiently large to exhibit roughly all the detail that might seem desirable. When this had been discussed and got into shape it would be desirable to leave the elevation alone for such interval as might be wanted to attend to some other of the requirements of the building, and then, with a fresh eye, return to the elevations and compare the last enlarged sketching with the first small scale drafts, and carefully consider whether in the subsequent elaboration the design had at all lost its primitive simplicity, and, if so, cut out all excrescences which might have caused such departure. There was ample room for true originality by the exercise of the restraint and the condensation of thought referred to above, and ample scope for its exhibition by skilful planning and grouping, so that its merit might at once be evident to any thoughtful observer when comparing any such work with the florid unmeaning designs, of which we had so many, worthy of the speculative builder, and lead him to say, "This seems to be the work of an architect."

Mr. H. H. Statham, the editor of *The Builder*, proposed a vote of thanks to the President and to the other readers of the papers of the evening. Having regard to the great majority of the buildings which have been hurried on in the present day, Mr. Statham considered they were characterised by an exuberance of ill-thought-out ornament, which he was afraid was to some extent due to the increasing prevalence of the system of competition, which almost invariably led to a desire to produce a design that should attract attention before anything else. At the same time, it was of no particular use that he, who opened the discussion, should agree with everything that had been said. He thought there were points where more was meant than met the ear, and he should like to suggest another side to the question. He believed that the more thoughtful minority of the architects, or some of them, had been perhaps driven to the opposite extreme from florid architecture,

and were rather in danger of drifting into what might be termed an affectation of simplicity. Before bringing forward one particular instance of this, he would ask, in the first place, were the critics altogether consistent themselves? They were wont to consider thoroughfares like the old Georgian streets as dull, but they were

AN INTERIOR DOORWAY—IMPERIAL INSTITUTE.

now told that it was stupid to have such an opinion. Mr. Ricardo had mentioned an instance in Lower Phillimore Place, where there was much more sensible architecture on one side than in the new buildings opposite. He knew an old Georgian street in which were red-brick houses with no ornament of any kind, but with a cement string carried from one end to the other. An architect came and made a new front to one of these houses, putting in gables at the top, and a very big window with plaster decoration over it. He was so anxious to obtain curves that he put a bow-window in the ground story by tucking the bow back to the inside of the walls. That was on the south side of Great George Street, and the architect was his friend Mr. Ricardo. He (the speaker)

PRINCIPAL CORRIDOR—IMPERIAL INSTITUTE.

was not shocked at that in the least; on the contrary, every time he passed "it contributed to his mental health, power, and pleasure." It was putting something very interesting and picturesque into that which he maintained was

a very dull street. At the same time he did not see how Mr. Ricardo's practice squared with his preaching.

Mr. Alma Tadema, Mr. William Young, Mr. Robson and Mr. William White also spoke.

Of the £100,000 required for the decoration of St. Paul's Cathedral, £20,000 has already been promised.

THE Inspector of the Local Government Board held an inquiry with reference to the application of the Corporation of Warrington, to borrow money for the purpose of widening Bridge Street from Friars Gate to Rylands Street. The Town Clerk and Borough Surveyor stated that the estimated cost was £31,189, but a resale of land and materials was estimated to realise £8,235, so that the net cost would be £22,954. There was no opposition to the scheme.

THE Leeds Corporate Property Committee have under consideration plans, prepared by Mr. Micklethwaite, for providing a museum, entrance lodge and ladies' cloak room at Kirkstall Abbey, at an estimated cost of £2,250.

MR. R. C. WHITELEGG, Architect, of Manchester, has taken in partnership a Mr. R. E. Whittaker. The style of the firm will in future be "Whitelegg & Whittaker."

THE Greenock School Board have invited ten architects to send in plans in competition for a school to accommodate 1,000 children, and the cost is strictly limited to £10,000.

THE piece of land adjoining Shepherd's Bush railway station, which was presented some time ago by the Ecclesiastical Commissioners to the Library Commissioners of Hammersmith, still remaining vacant, a gentleman has offered to give anonymously the amount necessary for the new buildings, providing that the ratepayers will arrange for their maintenance. It is proposed to again take a poll of the parish. The new library would cost, it is estimated, between £6,000 and £7,000.

OUT of 72 applicants, Mr. Colin G. Mitchell, late Surveyor to the Tonbridge Local Board, has been selected by the Sunbury District Council as their Surveyor and Inspector of Nuisances.

THE members of the Royal Scottish Academy have just filled vacancies in their ranks by the selecting of two well-known Associates of the body—Mr. Charles Martin Hardie and Mr. George Whittan Johnstone. The former has distinguished himself by limning incidents connected with the lives and works of Scott and Burns. He has also made a special feature of depicting incidents in the early youth of Mary Queen of Scots.

MR. GEORGE WHITTAN JOHNSTONE, the other new Royal Scottish Academician, hails from the same region as his distinguished countryman, Mr. Barrie. He has been an Associate twelve years. Mr. Johnstone has made a special feature of Scottish landscapes, and some of his best work relates to scenes near his native place. Mr. Johnstone is also a member of the Royal Scottish Water-Colour Society, and his pictures figure conspicuously in their exhibitions.

MR. JOSEPH J. GOODE has just been appointed Surveyor to the Taunton District Highway Board and Rural District Council.

THE Liverpool City Council have accepted the tender of Messrs. J. Patterson & Son for the new library and technical school, at £10,399.

THE ship-building yard of Messrs. Mackie & Thompson, Glasgow, was destroyed by fire on the morning of the 15th. The damage is estimated at £8,000.

ALL the Lurgan schools are to be closed in consequence of the serious outbreak of diphtheria. Over 100 children have died from the effects of drinking the town water.

ON OBSERVATION.

BY LEONARD STOKES, F.R.I.B.A.

(Continued from page 13.)

I think, after all, this we may safely say—that observation is the principal factor in the training of an Architect. And now as to his clients—if he ever gets any—well, here again, observation is the one thing needful, for a good Architect should always know his client almost as well as he knows his building, otherwise how can he hope to come well out of the enterprise. Some clients understand drawings, know exactly what they want, and like to get it; others neither understand drawings, know what they want, nor are they satisfied when they get it. Some clients—and these are in the majority—always expect to get just twice as much for their money as is represented by its market value; others are not satisfied unless everything they have is gorgeous and expensive, refinement and repose not counting with them. Some clients, again, have plenty of money and won't spend it; while others have none but will. Some clients always think they are being swindled by an Architect, but the same men will—without hesitation—follow the advice of a horse dealer. Some clients know everything, while others ask perplexing questions upon every conceivable subject under the sun, and what is more, expect an answer. These clients are comparatively harmless if blessed with short memories, but if not—and in weariness you sometimes answer at random—then your troubles begin. Some clients are ladies, some gentlemen, some women, some men, some honest, some not. Some are easy to deal with, some are difficult. Some pleasant, some disagreeable. Some one is glad to see, and others one hopes never to meet again. Some very troublesome, others most delightful. Some the greatest help to one, others just the reverse. Some clients think they buy you body and soul for 5% or a pig-stye, while others are surprised to find that any drawings are necessary at all. In fact, just as there are no rules that can be applied to architecture, so there are no rules—not even the two-foot one—that can be applied to clients, each one must be treated on his own merits—if he has any.

Observation then must be carefully applied to the client, and his little eccentricities studied for his own benefit. The client who really knows what he wants should get it, and every effort should be taken to meet his views, provided they are reasonable; but directly a client asks you to do something that you do not approve of, then protest quietly but firmly, and if he insists then, after due consideration, either proceed under a written protest or decline the work altogether, according to circumstances. But this must not be done hastily, as I have sometimes found from experience that what at first seemed unreasonable and impossible turned out after a little manipulation to be quite workable or even an improvement upon my own ideas. The clients, however, who don't quite know what they want and don't understand drawings, but won't admit it, are often very trying. At first everything is *charming*, but as the work proceeds you will find that they expected everything to be quite different—much more this, less that, and not quite the other. With such the only thing I think is to keep quietly on doing what you feel to be the best for the work itself. With the clients who expect more than their money will honestly buy I should advise caution. They must either be brought to expect less or to pay more, and it is not always easy to know which to try and persuade them to do; but whatever you do be honest with them, and tell them from the first what they have to be prepared for. In some cases they will “go” the extra money, and then all may be well; in others their requirements will be reduced to meet their purse, but, above all things, don't try by scamping to produce what will in the end be only a discredit to yourself and no satisfaction to your client; let your work, at any rate, be honest building. The gorgeous client is not so often met with, at any rate down south in these bad times, but when found his costly proclivities can generally be directed into the right channel after a little observation. Your wealthy client, who is stingy, should have lessons on the cheapness of really

good work rubbed into him, and the open-handed and would-be bankrupt must be restrained. The client who expects you to swindle him must not be gratified. The knowing ones must be given plenty of rope, and the curious gratified as long as your knowledge and patience will hold out. The ladies and gentlemen will turn out pleasant friends, and will help to make life worth living. The men and women will have their interesting side. Your clients will, I hope, for your own sake, all be honest, but such is not always the case, I fear. Under any circumstances observation will not be thrown away, as a little knowledge of character and human nature, a little tact and worldly wisdom will often help you through a tight place, when disregard of them would strand you hopelessly.

Touting for work is an objectionable and degrading habit, yet one must not sit too tight or no work at all will come our way. I don't think there is any harm whatever in letting it be known quietly among your friends that you are quite prepared to do any work there may be going; but don't show yourself too anxious, and, above all, don't try to cut out another architect. If you had bricks to sell I should not so much object, but amongst architects there should be a better feeling. It is unfortunately the case, however, that the pushing young man gets the work and the retiring one does not, quite irrespective of their respective merits. Kissing goes by favour all the world over, and architects are no exception to the general rule. Ladies are capricious and uncertain, and so are clients, but let us hope that better times are coming, and that a little more discrimination may be shown in time to come by clients in “the placing of their orders.”

What we should charge our client is often a question not easy to decide. We should certainly never swindle him, at the same time we are often almost driven into swindling ourselves by our system of payment on commission, for five per cent. is anything but a “living wage” in cases where the job turns out a tiresome or difficult one. As far as my observation goes, I must confess, I do not like the custom, and yet the difficulty is to hit upon a better one. If only we could get rid of the trades union kind of idea of the whole thing, and get the British Public to realize that one architect is not necessarily quite as bad as another, we should have done something. Why should we not have our 6 and 7 per cent. men as well as 5 per cent., if we must be paid by percentage? It may be just possible, with care, to stock a shop—or bazaar, I think the correct name is—with articles to be all sold at the uniform price of 6d. each, as we sometimes see done, but that is about the only precedent I can find. Why, therefore, should we turn our Architectural societies into 5 per cent. bazaars? Personally, I much prefer the good old custom of arranging things so that some discrimination is discernible—e.g., all this row, 5 per cent.; extra quality, 6½ per cent.; very cheap, 3½ per cent.; slightly damaged 2½ per cent., and so on. You may think I am joking, but I am not. What does your observation tell you? If I am honestly worth 5 per cent., then Norman Shaw should be put on another row, but if Norman Shaw is only worth 5 per cent., then I say—and it is not mere cheap humility—that I should certainly be slightly reduced in price. Has our enlightened high art public next to no observation?

This is a question easy to ask, but not so easy to answer. Our sisters, our cousins and our aunts don't take long to find out where they can get a good bonnet—and they know, too, only too well, not to look in one of your all-one-price bazaars, having recognised that a good hat can only be got from a good maker, for, apart from all question of materials, there is a style about a good hat, and it must be paid for—sooner or later. Now I fear our uncles and our brothers have not this discriminating faculty even for hats, which is a pity, for if they had it for hats, it might spread in time to their ties and trousers, and after a generation or two even to their houses. Want of appreciation for the suitable and simple even in dress is a great misfortune, as it is, as a rule, simply the indication of a want of appreciation for many other things. Observation, then, will enable you to judge your client by his tie to

some extent, and a careful study of his trousers, not forgetting the proverbial depth of their pockets, may help you even further.

But to return for a moment to the question of what to charge our clients and how to charge it them. In the first place I should like to insist upon my point that there are qualities in architects as in other men, therefore I think there should be prices to correspond—fix your minimum price if you will, but for heaven's sake do not reduce us all to that one dead level, as it has this melancholy result, it tends to reduce our work also to a common and not too high a level, and I will tell you how. Take a man with a goodish practice, inclined to do work rather better than the average, what happens as he finds himself going up the ladder of fame and fortune? First, he overworks himself, and that is good for neither himself nor his work; but let that pass, it is the next stage that I object to, which is, the neglect of his work, for if a man has more than he can honestly manage to do, he must neglect some part of it. Thoughtless, slipshod work—perhaps even the work of another—is the result, and, instead of improving as time goes on, his work steadily deteriorates. But he has become the fashion, and work still comes in, and in order to live up to our nineteenth century ideas he fills his pockets at the rate of five per cent. on a large practice, and does what he can with his conscience. Now, if instead of doing this he were to put up his fees, it would enable him to live reasonably well upon less work; he could then decline to do work he did not feel drawn to, and confine himself to congenial subjects, which he would then have time to think out properly, with greater advantage to the work, and with greater credit to both his client and himself.

I candidly confess I don't quite know what I should substitute for the percentage system, but some form of piece-work seems to me the best solution of the difficulty, and, at any rate, it would free us from that hateful suggestion that we at times involve our clients in “extras” simply for the pleasure of receiving our commission on them. If, however, the percentage system must perforce remain, then, at any rate, let us have a higher rate for the good men than for the bad, and for the reason I have given you, if for no other.

And now for the young man's work—when he does any. And as I have just been holding forth to him on the subjects of clients, let us hope that he will not fall out with them before he gets as far as bricks and mortar. Well, then, observation properly used will keep him out of many pitfalls, if it does nothing more. Buildings to be erected on town sites, cramped, crooked and overshadowed by high and perhaps shapeless buildings, require very different treatment—even though the accommodation demanded is identical—from buildings in country towns or villages, where everything is freer and more open, and it is only your judgment—which, after all, is only your stock of observation under another name—that will tell you how to treat each individual site, observe your surroundings, and, if possible, reduce them to paper; never mind whether they are good, bad or indifferent, they should be considered, as they have, in most cases, a considerable power for good or evil over your own building. “Style” is, as a rule, the first stumbling block that has to be overcome, and it, no doubt, is a difficult question and is hard to generalise upon to any good end. The subject, the site, or the surroundings will generally help you to some conclusion on this point, or if not, your own or your clients' tendencies will perhaps settle the question. But whatever “style” you work in, do not lose your head. Dignity and reserve, your own observation must tell you, are worth cartloads of fussiness and elaboration. Do not be too slavish or think yourself bound to do this, that or the other, simply because it was done before so many hundred years ago; at the same time, do not be too original, or do things simply because they have never been done before. Observe how time has treated your neighbours, and contemplate your own budding design as though it were say twenty or thirty years old. You will then, perhaps, notice that the most elaborate and quite too charming parts of your building are such a mass of decay and dirt, that you cannot tell which is

the carving and which the soot. This being so, I should say omit your charming feature and do without your carving. In towns such as Liverpool, it seems to me you cannot have the exteriors of your buildings too simple,—a building of good proportion and balance throughout, constructed of some material—if there is one—that does not turn absolutely black will always hold its own, in my opinion, with your “ornamental” building which trusts as a rule, to confusion and bewilderment for its so-called beauty, and particularly if your simple building will keep tolerably clean, while your ornamental one becomes a mass of matter in the wrong place. Observation then will help you to make the design of your building a suitable one, as far as appearances go, and observation will also help you to make it a good, useful building, for I think one of the first things one should do upon being called in to do anything which is, more or less, new to us is to trot round and observe how other men have tackled the same problem. I do not wish to suggest that you should in anything but a limited sense copy other men. Improve upon them, is what I advise, and this can only be done by first observing their faults, and avoiding them, and then taking their good points and developing them.

In the choice of materials, too, observation should help us greatly. There are some materials, such as marble, onyx or alabaster, which are full of design and detail in themselves. These, therefore, should not be used, in my opinion, where you wish your own design to tell to advantage. I mean, of course, any design with much detail, such as mouldings, carving, &c., in it. This, you will probably say, is quite obvious; nevertheless one often sees figures of saints, &c., carved in alabaster, with the result that streaks of colour nearly always crop up just where they are least desired. A pair of piebalded ponies, nicely kept and well turned out, look very quaint and taking, particularly if they have plenty of ‘blood in’ them; but I never yet saw a pair of skewbalded saints, however much ‘blood’ they had, without experiencing a cold shudder down the small of my back. This may be an extreme case, yet the principle applies to many things besides saints. Where nature provides you with detail, carefully omit your own. Two designs are not required for one object, or at least your design should be so arranged that nature has fair play, and a chance given it to show itself off to advantage.

In fixing upon your “style” and materials do not shirk the subject or shut your eyes to the limitations of either one or the other. One sometimes meets with a tolerable design for a brick house, say, which has been much marred, simply because the Architect did not stop to think out the capabilities of his material; so that when, perhaps, too late to do anything else, huge pieces of stone have to be introduced in order to construct the design, instead of approaching the subject from the other end, and in the words so often used before designing your construction. With a little thought a brick and stone design for the same house could have been produced and would have looked ten times better than the crippled brick design; but, I am sorry to say, Architects often shut their eyes to practical difficulties, and are satisfied with turning out paper designs which can only be constructed at the sacrifice of much that might have been obtained with just a little more observation. Much depends upon the judicious choice of materials, and also upon their proper treatment in your design. Most people would agree, I fancy, that the Parthenon would not look as well constructed in terra-cotta as it does in marble, quite apart from the fact that a piece of marble may be more beautiful than a piece of terra-cotta. The Parthenon is a design of large, simple treatment, and of necessity would lose much of its dignity if constructed of a little material however beautiful that material might be. Therefore I say, if you are designing a Parthenon, select a material that will do it justice, but if you are obliged for some reason or other to use a small material, then your design should recognise the fact, and be thought out accordingly.

This concluded Mr. Stokes’ remarks to the Architects of Liverpool, with the

exception of a concluding paragraph, of which the following sentences only need be quoted:—

I fear I am not a great believer in the value of papers such as these—they take a lot of time to write, a very little to read, and next to none to forget, and then we all go on just as of yore. I cannot flatter myself that this one will prove any exception to the general rule.

A CHAT WITH NORMAN SHAW, R.A.

I HARDLY know how it was I came to call on Norman Shaw—the name is so phonetic, that to put a prefix or a handle of any kind, would spoil the effect, and so we all say Norman Shaw; and depend upon it, when once the world begins to call a man plainly by his Christian and surname, that man has done something worthy of being remembered. I had been in the North, and had dropped upon the little old-world village of Rothbury, coming over by the single line railway from Morpeth—reported to contain many very interesting architectural remains, but which were certainly not apparent from a hurried walk through the town from an extremely dirty hotel to an extremely dirty railway station, in the early hours of a cold and spiritless morning. Nor at Rothbury was there anything of much note, except the twelfth century bridge spanning the swollen Croquet, and inviting one to wander down the Northumberland lanes and climb the mountain upon which “Crag-side,” Lord Armstrong’s beautiful home in the woods, nestled. I had taken that “wander,” and had climbed the mountain side, and when I stood upon the plateau upon which Norman Shaw’s house stood, I thought that the little architectural coterie of Bloomsbury was very much nearer than it really was; and that was, perhaps, how I went to Hart Street to see one of the most delightful architectural artists in England. There is nothing typical of the man of T squares and drawing boards about Norman Shaw. The sleeves of his coat are not shiny, nor is there an atom of that superior “don’t-care-if-I-do-appear-shabby” look about the Royal Academician. In fact, he has the aspect of a Cabinet Minister, even though he possesses a supremely gentle and courteous bearing unknown to gentlemen who rule the political destinies of the moment.

Mr. Shaw’s room in Hart Street is as spick and span and as dustless as his own person; as there is no atom of dust upon the coat of Norman Shaw, so there is no atom of dust upon his table. On the walls a few original perspective drawings of his buildings, a few ornaments upon his mantelpiece, a cabinet in oak of his own design, and nothing more.

I told Mr. Shaw of the advent of “THE BUILDERS’ JOURNAL,” and he expressed, in most emphatic tones, the very great need there was for it, and then we settled down to ten minutes’ chat of the thrust and parry order—one delicately probing, the other as delicately shuffling from the point. For instance, when I began to talk of the very charming work of one Norman Shaw an apologetic manner came over the worthy artist, and nothing would induce him to frankly answer my questions. This was modesty, modesty of a very distressing and hurtful character—modesty which harms all and benefits none—modesty which is foolish when it comes from a talented man whom the world has recognised as such, and whose whole life has been devoted to good work under the highest influences.

Although Mr. Shaw calls his own work poor—think of it! and says in style it is nothing but a re-action from acute Gothic, he shows the better artist when I asked him to tell me what he considered was his best work.

“Best work!” said the Royal Academician, “best work!” and an honestly pained expression crept over his face. “I have no best! *I have never yet been satisfied.* I have never yet conceived a work which has not fallen miserably short of my conception. I am always striving to do something good, but when I think of what I have done, when I see how much I could improve *that*, now, how much I should like to alter *that*—and *that*—and *that*, it makes me shudder and I am miserable; therefore I have no best!”

Here we get the pure modesty—the modesty which is the hand-maiden of pure art, and how very little there is of it amongst Architects of to-day!

Norman Shaw has strong views upon the terribly inefficient education of architectural students. He can see no hope for it unless the Royal Academy greatly increases its scope, and throws its doors wide open to the architectural world.

JEAN FRANÇOIS MILLET.

The Peasant Painter of Barbizon.

By ARTHUR O’NEILL.

THE life story of Jean François Millet will seem, I am afraid, a sad and almost tragic one—a story of a constant purpose of brave effort, of great endurance and noble work—the story of a career which passed, after many struggles, from the darkness of penury into the light of ease, though the light came only in time to soothe the last years of, perhaps, the most penetrating of all the God-gifted souls who have devoted themselves to the divine task of interpreting nature to humanity, of discovering beauty where the common eye saw dross, of glorifying humility and elevating the variegated shreds of the humbleness of a peasant’s homely station into an atmosphere where he and his surroundings, his uncouth figure, his daily avocations shine resplendent in the firmament of art; and, like the stellar meteors, illuminate our sadly barren earth.

The Shakspearean dictum is more applicable to artists, perhaps, than to men of letters, that the lives of good men do live after them. It was never more positively illustrated than in the case of Jean François Millet. Those who are endeavouring to fathom the secrets of Nature and bring her manifold phases within the compass of the brush or pencil, may be presumed to know of the many instances which our own annals record of unrecognised genius, of an appreciated talent, of a great heart wearing itself away, by its strenuous palpitations, in a vain attempt to arrest the public notice. Shall we call Turner to witness, or David Cox, or Bonington, whose influence founded a “cult” in France, ere yet his own countrymen had learned to discern the precise technique of his own draughtsmanship and the wondrous luminosity of his aerial perspective. Shall we summon as witnesses those who bought from the Norfolk School in the days when it was young and grandly strong with the strength of youth.

You have heard of the terrible conflict with the fateful forces of George Müller, of George Mason who painted poems, of Frederick Walker, of poor George James Pinwell who would have been a giant if he had been allowed to live, of Paul Grey, the very name of a shade even in artistic circles, but the name of a man who would have deserved to be an Academician by this time if the powers of life and death had spared him to us.

Or to change the venue poll, the people who are proud of their privileged position at “private views,” and how many of them in France or England know George Michel, the old Crome and Cotman combined of the highlands to the north of Paris, who, with the vivid grasp of an athlete, as graphic as Salvator Rosa, depicted with a splendid mastery of all the artifices of art the nude beauties of the Buttes Chaumont, the quarries behind Montmartre, the thousand and one scenes of natural beauty which lie slumbering on either hand. The peasant-painter of Barbizon I have called

Millet. It is his own description of himself. He is always reminding his close and helpful friend Sensier that he is a peasant. "I am a peasant," he says in a letter to Sensier in April, 1867, "I have only wished people to think of the man who gains his bread by the sweat of his brow." But let it be marked that this peasant and painter and poet was not a boor. He could read Theocritus in Greek and once ventured on an illustrated translation of one of the Idylls. Poussin was his chief model—Poussin, the first of the Naturalists—and Virgil was his favourite poet; he was steeped to the tips of his finger nails in the classics of his own language; he studied Homer and Dante and Shakespeare; and one of his most grateful letters he addressed to M. Chassaing, in acknowledging the receipt of the poems of Robert Burns. Truly, it was fit that the genius who exalted rusticity, should be offered as a tribute to his especial talent the work of the poet ploughman who gave the humble daisy a distinction all its own.

Millet, peasant, as he loved to describe himself, was a man of more than common culture. He had read much, and he had the faculty—I doubt whether I should call it a happy one—of remembering everything. He rejoiced in living and dressing like a peasant, in striving to understand the peasant class in his Western birthplace of Grèville, and in the great forest of Fontainebleau, wherein he pitched his tent permanently for the quarter of a century of his productive life. It was in that spacious region of monarchical trees and cyclopean rocks, of umbrageous avenues and austere defiles; it was there, in the little village of Barbizon, where the one rim is decorated, from basement to rafters, with what are now the priceless drawings of artists whose names are emblazoned on the scroll of fame; there, in a long little one-storeyed cottage, it was that I was fortunate enough to make acquaintance with this singularly gifted painter of humble life. It is long ago; it was in 1873. I had taken introductions from Paris, where he had at last asserted himself, though for poor prices as compared with the sums his pictures bring in now-a-days, I had seen one of his numerous "Sheep Shearers" either in Goupils' or at the Salon in that year. What is more important, I had seen an etching of "The Angelus," that marvellous study which profoundly moved me. It was the emotion engendered by that grand and beautiful picture of rustic piety—of the peasants suspending their labour in the field as they listened to the bell of the distant church—which impelled me more than anything else to seek the inventor of the impressive, I could almost say audacious, composition. The introductions I carried were entirely unnecessary. It was one of the days when the dear Master was suffering another instalment of his earthly martyrdom. It was a bright May-day; but one of the terrible headaches, which made the latter years of his life years of pain, had compelled him to throw aside brush, palette and easel. I did not know that at the time. Millet received me most cordially. He asked me if I were an American, for that people, he said, had found out that there was "something in him" long before his compatriots had ended their dispute as to whether he was not vulgar. Imagine a man a little over medium height, heavily bearded, wearing apparently a fox-skin cap, with a singularly mobile face, with eyes that seemed to pierce one through—a man who had read much of English literature, but could not speak the language—a man who seemed to distrust the value of the words he was using, and yet was anxious to know all that was doing in the Art world on the other side of the Channel—a man who impressed one at once as heaven-favoured in his singular capacity for seeing into the very heart of things—a tree or flower, a herd in the pastures, a gleaner in the cornfields, a servant in the vineyard, or a visitor from abroad—all and everything were subjected to the close, but not obtrusive, scrutiny of those large and searching brown eyes. He would let me see none of his own work, except some charcoal sketches. He showed me, however, his portfolios, which were, to be frank, enclosed in sheets of brown paper, and there I saw a goodly sight of drawings by his constant friend, Theodore Rousseau, some sketches by Troyon, a few of the hasty

memoranda of Diaz, one, only, drawing by Corot, who until the last protested that he could not understand Millet. "I have my way of looking at things," he is reported to have said, "and those Barbizon men have another. They are clever, but they do not please me; I prefer my own method to theirs."

Millet had been smitten with the Japanese craze a few years before my visit, and came very nearly to a quarrel with his friend Rousseau over a *trouvaillie*, which fell to him at the Hotel Druot on one of his rare expeditions to Paris. There were fans and oddities, and all sorts of Oriental bric-a-brac, which he took more pleasure in, apparently, than in the lovely drawings and sketches which filled his invaluable brown paper sheathings.

But to try to describe to you the Poet, Painter, or the Peasant, Painter, the honourable and involuntary master of the Barbizon School of Art, would be to "mock description's littleness." He permitted himself, with his picturesque raiments, to be sketched only by one or two intimate friends. How it comes to pass that I have in my distant home large photographs of Millet and his wife—they hung on my library wall cheek by jowl with a pencil sketch of Corot—I cannot for the life of me say, for they are larger than the admirable engraving published by "Scribner," and I can only conjecture that I picked them up somewhere in Paris. There is one photograph which is remarkably true, and it was taken by a member of the Barbizon fraternity who did not disdain the camera, although they loudly protest against its employment as an adjunct to the legitimate implements of the painter's art. This photograph represents Millet standing, full length, in *sabots*, his back to a wall, and his head raised straight and proud; the leg a little forward, like a man who balances himself exactly; his hat is in his hand, his chest out, his hair combed back, and his eyes as if fixed on some threatening object. He wears the grey jersey of the country, and I again quote Sensier, "he might be one of those enthusiastic peasants, victims of our civil wars, who, vanquished, look at death without flinching." This picture is to me Millet's whole life; he was pleased when I said: "You look like a chief of peasants about to be shot." "He was taciturn," says my own spontaneous informant. "People tried to know him because he was eccentric; they tried to make him talk, and only succeeded in obtaining a few words of cold civility. He was confiding and talkative only with his friends. Walking through the forest, which had the power of making him forget his enemies, he was often eloquent to a remarkable degree. He became enthusiastic over the majesty of the woods, the crumbling of the antediluvian rocks. He had new and original thoughts. He saw man in the past, savage man, living happily under these great branches. Then, as the sun fell, he recalled the folk-legends, and his imagination took colour from the fading day. He explained the terrors of the peasant with the clearness of a seer."

(To be concluded.)

IRISH—ARCHITECTURE.

THE following communications and specimens of native professional journalism are too delicious to be conveyed direct into the limbo of the W. P. B. A certain weekly Architectural Journal advertised its requirement of the services of a clever Sub-Editor, and amongst hundreds of replies were the following:—

"Feb. 13th, 95.

Mr. A B C D * * * * * B L. writes in answer to the advertisement in to days *Daily News* which is as follows;—"Subeditor. A smart & clever subeditor wanted immediately. He must be a man of education, possessed of an appreciative knowledge of architectural subjects' etcetera.

As persons applying for posts of any kind are generally supposed to be a little autobiographical, it is perhaps right for me to say that having taken classical honors & prizes, & having graduated, in Trinity College, Dublin, I was called to the Irish Bar, which I followed for some years; but not

succeeding in getting briefs & being in want of money I have definitely given it up, & nine months ago came to London with a few of getting on the press either as an original writer or, failing that, as a reporter.

I have no *press experience of any kind*. This of course is a draw-back, *but not an insuperable one*, for first of all, instances are not wanting in various walks of life of men who have gained distinction in spheres of action for which they do not seem previously to have had any very proper training, it can also be surmounted every easily:—if you say—"where is your experience?" I answer "give it to me, and you will see its fruits."

I will be content with a salary of — a year, payable weekly, monthly or quarterly.

Enclosing a short article on architecture,

I am, yours faithfully,
A B C D * * * * * B L.

Excuse the change from the third to the first person."

Then comes the short article on architecture—

British architecture may be said to come from four sources—Greece, Italy, the Gothic and Saracenic. Of these the Grecian excels in beauty, to Italy is due the invention of the arch, the Gothic is perhaps suggestive of strength and ruggedness, the Saracenic or Moorish of picturesqueness. Association of ideas has so much to do with our judgments that it is hard to say how far these judgments correspond to things as they are, or to things seen through the atmosphere of our feelings. Perhaps most English people would prefer the Gothic to the Grecian style in a church, considering the latter more fitted to a heathen temple. Association of ideas may be the cause. But as most people will allow that each of the above classes has merits of its own, possibly the most perfect style would include a combination of them all. In architecture, as in many other things, the saying holds—"you must cut your coat according to your cloth." Old buildings to be preserved must be kept in repair—a truism to be borne in mind in the case of Shakespear's house or St. Paul's Cathedral. New ones will not start out of the ground for nothing. Hence those who build should look before they leap, and not be fools to build for wise men to buy. Buildings of a high and elaborate style must of course be paid for in proportion, else "poor men's cottages had been princes' palaces."

Another gentleman who states that he successfully edited one of the illustrated Art newspapers, enclosed a "Caustic criticism on present day pictorial illustration." He was also an Irishman, and here is the Caustic criticism—

"Is photography killing art? It would really appear so, judging from the wretched pictorial illustration of the present day, there is scarcely a modicum of art in it, yet we fondly imagine that we are becoming an artistic nation: the public is certainly unable to judge the merits of its illustrated press or it certainly would never submit to be imposed upon by most of the vile rubbish which now passes muster as pictorial illustration; the photographer and zincographer have between them brought it low indeed, and our picture galleries seem to be following suit—the photographer, or is it the "artist" turned photographer?—labouring under the delusion that careful study is not necessary now that he can so easily copy his poses from a realistic photo, and not content with copying the poses, copies the photo effect as well, quite ignoring the good old maxim, that "art is nature idealized," and finding his market with those who are content to accept 'shoddy' so that they may make a handsome profit thereby.

Such is modern pictorial art, unless it is 'made in Germany.'"

SOCIETY MEETINGS.

Edinburgh Architectural Association.

—At a meeting of this Association, at the Royal Institution, Mr. W. W. Robertson, the President, in the chair, Mr. Percy Fitzgerald, F.S.A., made a communication on "Adam Architecture in London." Having suggested that there were at present symptoms of a revival of interest in the work of this illustrious family of architects, the lecturer proceeded to deal in considerable detail with the architecture of Robert Adam, whom he described as "the flower of the flock," and a man of extraordinary versatility, dramatic power, and ability. His style was inspired by Diocletian's palace at Spalato, with all the peculiar incidents of which he became permeated. On Adam's return to this country, the lecturer showed how extensive his practice became, giving it as his opinion that no other architect ever enjoyed so large an amount of remunerative work. In London alone it was almost incredible the number of buildings he set up. As to his principles of style, one of the most outstanding features was his marked individuality, Adam putting his stamp on everything he did. His exact sense of proportion, his great care as to the minutest details, and his singularly refined taste in various directions, were notable characteristics of the man. Dr. R. Rowand Anderson, in moving a vote of thanks to the lecturer, said there was no doubt that the architecture of Adam was beginning to have its weight in the architectural study of the rising generation of architects, and they were fortunate in Edinburgh in possessing some of his very best examples. The Register House, to his mind, was the finest thing they had in the city. At the same time, he thought the father's work was a much more vigorous type of work than the son's.

Society of Antiquaries of Scotland.

The usual monthly meeting of the Society of Antiquaries of Scotland was held on the 11th inst., Mr. Gilbert Goudie in the chair. The first paper read was a description of a supposed mithraic temple, recently discovered at Woudham, in Kent, by Mr. James Lang, F.S.A. Scot., of Glasgow. Dr. David Christison, Secretary, gave an account of the forts on the southern slopes of the Lammermoors and the Moorfoots, which are generally distributed along the valleys of the smaller streams falling into the Tweed. Mr. Lockhart Bogle, F.S.A. Scot., gave an account of several prehistoric structures in Glenelg and Kintail, with ground plans and sketches. In the next paper an account was given of the discovery of a cist, with a cup-and-ring marked cover, in a sand-pit at the Cunnigair, Tillicoultry. The cist was of the usual character, but the covering stone was a huge block of granite six feet in length, and sculptured on its upper surface with rings, spirals, and lines. There was exhibited a finely-ornamented urn found near Harvieston Castle, which is now preserved in the Dollar Institution. In the last paper Bishop Dowden called attention to two late notices of the *cultus* of St. Ninian in England.

Plymouth School of Art.

—In the twelfth lecture, at the Plymouth School of Art, Mr. B. Priestley Shires, A.R.I.B.A., dealt mainly with the subject of Early English architecture, and explained the characteristic features of the different kinds of windows and doors, with their ornaments and enrichments. As regards the latter, Mr. Shires said the opening of the thirteenth century saw a new era in ornament, all attempts at Grecian and Roman imitation were given up, the heavy massiveness of the Norman style shaken off, and succeeded by a true English style, with a lightness and peculiarities not to be found even in Continental work. In some cases the carving is very free and graceful, but as a rule there is a spirited stiffness in the forms which is very characteristic and pleasing.

THE bridge at Cregrina has just been reconstructed under the direction of Mr. Stephen W. Williams, county surveyor for Radnorshire, Messrs. E. Davies & Son were the Contractors for masonry, and the Horseley Iron Co. carried out the ironwork.

DECAY OF BUILDINGS.

THOSE who have for any considerable course of years been in the habit of revisiting any particular ruin can scarcely fail to have observed how sensibly and how surely the course of decay, disintegration and downfall has progressed, even where there has been no deliberate mutilation. In many of the best preserved ruins we find—says *The Architect*—the surfaces of the mouldings and carving covered with an ever-fresh pulverulence. If you visit a building in this exposed condition after a hard winter, you are sure to find fresh spots where the details have fallen off through the recent frost, and in every ruin there occurs from time to time slips and downfalls of greater or less importance, showing that, long as they have resisted the assaults of time and weather, there are limits to their duration, and that those limits are by no means distant. How many of our ruined buildings have lost large portions within the memory of man. Indeed such downfalls, if their statistics could be collected, would be found to reach an alarming number and amount, while the silent and yet more fatal progress of decay is every day and every hour eating into the most beautiful and most precious architectural details. And how could it be otherwise, when walls constructed of small stone and rubble-work are exposed, with no protection but ivy and wall-plants, to the constant action of the most destructive of climates, when every shower penetrates the crumbling mass and every frost has its full swing in its disintegration, and even the more solid stone, from being kept in a constant state of saturation with water, has every cause of destruction in full and continued operation upon it, and all this for centuries together? Nor have these been the sole agents of destruction. Many—indeed the great majority—of our noblest abbey churches, and even some cathedrals, have been taken down for the value of their materials, and those which were left as ruins were for the most part spared more because there was no market for their material than for any care for their preservation, and it naturally follows that they would become the quarries which would supply all the petty buildings around them. Perhaps the most remarkable case of this is at Reading, where the walls of the abbey have been stripped of their ashlar, both without and within, and the rubble core only left. This has been continued in many instances up to our own day, and even now it is occasionally found in a certain degree to hold good, as at Easby Abbey, in Yorkshire, where the lower part of the buttresses appear to have been comparatively recently pulled down, as being the parts most easily got at, while the upper stages, being out of reach, are left unsupported and dragging over the walls which they were built to stay. For the most part, however, it is neglect and the want of timely care which we have now most to complain of. The proprietors of these melancholy yet glorious remains, though valuing and caring for them as picturesque ruins, frequently seem to forget their value as works of art and to prefer risking their falling to pieces bit by bit to the trifling interference with their picturesque effect which would be incurred by a timely repair.

THE Wilmslow District Council has received the sanction of the Local Government Board with reference to the borrowing of £3,130 for the completion of the works in connection with the southern or Fulshaw scheme of sewerage. The sum of £10,000 has already been expended, and another £10,000 is shortly to be spent in constructing a scheme for the northern end of the district, the District Council having already secured powers and the necessary land. The southern portion will have cost something like £14,000 when fully completed.

Correspondence.

The Editor welcomes Correspondence on matters of general interest. Gentlemen thus addressing the Editor should condense their communications as much as possible.

68, St. Paul's Churchyard.
Feb. 15th, 1895.

To the Editor of "THE BUILDERS' JOURNAL."

SIR,—In the article of "THE BUILDERS' JOURNAL" No. 1, headed "A Chat with Mr. Penrose," I am reported to have said—in answer to the question "You have no opinion to offer on the reredos erected some years back?"—"None; it was Messrs. Bodley & Garner's work, and of its kind extremely fine." (The italics now only introduced.) This answer so entirely traverses my determination to say nothing whatever on the merits or demerits of works which have nothing to do with my own responsibility, that I am sure your interviewer must have failed to note down my answer correctly as to the words above given in italics.

Your obedient servant,

F. C. PENROSE.

[It is, of course, not impossible that our interviewer incorrectly noted Mr. Penrose's answer, though that is much more than improbable. We regret our worthy correspondent did not query the proof which was submitted to him, and which he kindly returned to us with one correction only—Ed.]

7, Finsbury Square, London, E.C.
Feb. 15th, 1895.

To the Editor of "THE BUILDERS' JOURNAL."

DEAR SIR,—I notice that in your issue of the 12th inst., you state a Mr. Mecenero was the artist for the mosaic panels in the dome of the Greek Church at Bayswater, this is incorrect, as the artist was an Englishman, Mr. Arthur E. Walker, of the Cedar Studios, Glebe Place, Chelsea, an old schoolfellow of mine.

I believe the contractors for the material and fixing were Greeks, and this may account for the mistake.

Yours faithfully,

WILLIAM HODSON.

SAWDUST.

THE Bishop of London's Fund has granted £1,000 towards the new church of St. Etheldreda, Fulham.

At a meeting of the Manchester City Council yesterday Alderman Hoy proposed a resolution which involved the acceptance of a tender for over £140,000 for the erection of a Technical School. The building, he said, would be a cheap one, and was needful to meet the requirements of the city.

THE Town Council of Newcastle-upon-Tyne, have decided to rebuild a portion of the quay and the grain warehouse. The cost will be £24,000.

MESSRS. GOTCH & SAUNDERS were the architects of the new church recently erected at Kettering, and the structure is built mainly of local Sandstone and Weldon Stone. The style of the fabric is late gothic. Mr. G. Henson, of Wellingborough, was the builder.

THE Leeds City Council, which already owns and works its tramways, has decided to promote "a Bill to empower the Mayor, Aldermen, and citizens of the city of Leeds to construct additional tramways, and for other purposes." The decision was arrived at by a vote of 46 to 1.

MR. J. S. CRAWSHAW, who has for several years past occupied the position of surveyor and sanitary inspector under the late Skegness Local Board and the present Urban District Council, has been elected surveyor to Weybridge Urban District Council, at a salary of £200 a year. There were upwards of 200 candidates for the post.

IT is proposed to build a small house on the Cleveland Moors. The material used will be local stone Ashlar, and the roofs will be covered with Whitland Abbey slates. Mr. A. E. Street, M.A., is the architect.

IT has been decided to adopt Mr. Meade King's scheme for rebuilding the bridge to the baths at Durham, which is not considered safe. The estimated cost of the work is £845.

THE gold medal of the Society of Engineers has been awarded to Mr. T. W. Baker, C.E., for his Paper on the "Utilisation of Town Refuse for Generating Steam;" an ingenious method of burning up the ash-bin collection, and using the heat for driving machinery, &c.

THE opening to the public of Lincoln's Inn Fields Gardens, which have been taken over by the County Council, will probably take place on Saturday the 23rd. Sir John Hutton will perform the ceremony.

THE parliamentary estimate of the new works proposed to be authorised by the Mersey Docks and Harbour Board Bill, as prepared by Mr. A. G. Lyster, C.E., is set down at £105,000, of which £67,250 will be expended upon the floating landing-stage in connection with the Birkenhead Dock. The balance of £37,750 will be for the construction of four piers and one bridge to connect the stage with the river wall, &c. The new borrowing powers sought to be exercised under this Bill are for £160,000.

THE work recently executed by Messrs. Crace at the Town Hall, Leeds, for the City Council, cost £5,175.

THE cost of the proposed restoration of the lower part of the Tower of Dewsbury Church, with the addition of new buttresses and a belfry stage, together with the rebuilding of the north aisle, will be upwards of £25,000. The existing clearstory windows have been replaced by others of a more suitable character. The architect is Mr. A. E. Street.

THE Special Sub-Committee of the Liverpool Library, Museum, and Arts and Technical Committee, who are engaged in considering the matter of provision for technical classes, have had before them a report and plans submitted by a Mr. Armstrong, and also a report and sketch by the City Surveyor, prepared in accordance with the resolution of the Committee at a previous meeting, and showing how the site at the corner of William Brown Street and Byrom Street could be made to afford accommodation for a technical school, an extension of the museum, and a large public hall.

MESSRS. MOLINEUX, WHITFIELD & Co. are erecting new Bank premises at Eastbourne, from the designs of Messrs. Mitchell & Ford, architects, of Eastbourne. The style adopted is Italian Renaissance, the ground floor being treated as a base, with panelled piers and plinth, to the first and second floors, which have engaged fluted Corinthian columns and pilasters, extending the height of both stories, surmounted by entablature with pediments. A dome, covered with Braby & Co.'s metallic tiles, is introduced as a central feature. The building is to be faced with Bath stone, the cornices and principal projections being of Portland stone. The roof will be covered with Westmoreland green slates. The internal fittings of bank, screens, dados, &c., are in polished mahogany. Electric light is to be fitted throughout the building. The whole of the plastered work is finished in Keene's cement. The building will be completed in about twelve months. The floors are to be fireproof, by Messrs. Mark Fawcett & Co. The builder is Mr. M. Martin.

THE question of appointing lady Inspectors seems to be a vexed point with some of the London Vestries at the present moment. The Holborn Union considers that the appointment of female Inspectors to the Local Government Board is a reform greatly needed, and the Islington Vestry has gone so far as to appoint a lady Sanitary Inspector at a salary of £100 per annum, with a "rise" of £10 a year to a maximum of £150.

AMONG the additions recently made to the Ruskin Museum is a series of the original pencil drawings by Professor Ruskin, which formed the foundation of a dozen of his published plates, illustrating "The Seven Lamps of Architecture," and "The Stones of Venice." It is well known to book-lovers, and the possessors of copies of the first edition of "The Seven Lamps" especially, that the plates of that issue alone were etched by the author himself.

THE members of the corporation of St. Helens, a few days ago, had the interesting experience of walking through the whole length of the new intercepting sewer which is being constructed from Ashcroft's Bridge, Parr, to the outfall at the Double Locks, and which is now completed within a few yards. The main sewer already constructed reaches from Spray's Bridge, Boundary Road, to Ashcroft Street, a distance of about 3,000 feet. The new added portion is 1,900 yards long, and is being constructed by Mr. Peter Ticker, Builder, Fleet Lane, the contract being for £15,000, which will make the total cost of the sewerage system about £50,000.

MESSRS. ROUMIEU & AITCHISON are the Architects for the new buildings of the Grosvenor Hospital for Women and Children, in Vincent Square, Westminster, which will be commenced early in the Spring.

THE Society of Arts is offering two prizes—a gold medal and £20, and a silver medal and £10—for the best photogravure copy produced from Mulready's picture, "Choosing the Wedding Gown," now exhibited in the South Kensington Museum, the object of the offer being to encourage the development of photogravure in this country. Permission to photograph the picture has been obtained by the society from the Science and Art Department.

THE Ottawa Minister of Trade states that the lowest tender for laying the Pacific cable has been received from a London firm, the amount being £1,517,000. The route proposed is from Vancouver to Fanning Island, Fiji, and Norfolk Island, the cable dividing at the last-named place into branches to New Zealand and Australia. The amount of the tender is about half the estimate made by the British Postal authorities.

THE Louvre possesses a treasure hitherto unsuspected, and the discovery is due to a German *savant*, Dr. Winter. The fine marble designated "A Greek King as Hercules" is in reality the portrait of Mithridates Eupator, due to the chisel of a sculptor of Rhodes. Dr. Winter, who belongs to the Berlin Museum of Antiquities, has proved the authenticity of the marble by the aid of documents in the possession of M. Théodore Reinach.

BOOKS RECEIVED.

The Local Government Annual—an Official Handbook, 1895. Fourth year of publication, 1s. 6d. S. Edgcombe-Rogers, Dorset House, Dorset Street, E.C.

A little volume which claims to be the only complete Local Government Directory published. It contains a mass of useful information on local government matters, but its index is sadly in need of revision.

The London Building Act, 1894. With the Bye-laws and Regulations of the London County Council, and Introduction, Notes, Cases, and Index. By A. J. David, B.A., LL.B. 3s. 6d. Crosby, Lockwood and Son, London.

The author states that the aim of the present volume is to facilitate the perusal and study of the very important statute with which it deals, and to make more easy of acquisition a knowledge of the numerous details distributed throughout the different parts of the Act. We think the author has done what he aimed at in the production of his neat and cheap little work.

The London Building Act, 1894. With Appendices containing Statutes, other than the Building Act, still in force and affecting building operations; also the Bye-laws, Regulations, and Standing Orders of the London County Council, and of the Commissioners of Sewers of the City of London. With Concise Notes and Cross References. By William Russell Griffiths, LL.B., of the Inner Temple, and Francis W. Pember, M.A., Fellow of All Souls. 12s. 6d. London: William Clowes and Sons, Ltd.

The editors present this volume to the public in the hope that, though it may not be absolutely exhaustive of the subject, it may yet be of some assistance to those who have to observe or to enforce the statutory obligations imposed on persons interested in building operations in London. We should be inclined to add greater praise to this work than the editors feel inclined to offer it. It certainly is as exhaustive as any work upon the same subject. Its references are ample and plainly made, its indices are full and well printed, and the work in its entirety is one which should find a welcome from those to whom it appeals.

The Quantity Surveyor. By Charles Henry Searle. Being a treatise on the most Modern and Approved Methods of Measuring the various Artificers Works in connection with Buildings, Drawing up Bills of Quantities, and Drafting Specifications and Contracts. In parts, 1s. 8d. per part; of the Author, 16, Southwark Street, London, S.E.

The author has sent us the six parts already published, and there is an enormous fund of technical knowledge shewn in the compilation of the work. It appeals to the professional Quantity Surveyor and to the Architect who takes off his own quantities, and to all other professional persons anxious to get an insight into this very dry but very useful department of professional study. To those, we know of no work more plainly or more carefully dealing with the subject, and we hope that further editions may be called for so that the proprietor editor may be able to reduce his price down to popular proportions.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the work.

CANTERBURY.—For pulling down premises, and erection of four cottages on same site, St. Radigund street. Mr. W. J. Jennings, architect, 4, St. Margaret street, Canterbury:—

COMPETITIONS.

COUNTY BOROUGH OF WEST HAM. COMPETITION.

The Council of the County Borough of West Ham propose to ERECT a TECHNICAL INSTITUTE and PUBLIC LIBRARY in Romford Road, and they hereby invite Architects to submit DESIGNS for the same in competition.

Premiums of £250, £150 and £100 respectively will be paid to the Authors of the Designs which are placed by the Assessor first, second, and third in point of merit.

The Competitor to whom the first premium of £250 may be awarded will be employed as Architect, and will be remunerated in accordance with the schedule of professional practice and charges of architects, published by the Royal Institute of British Architects, such remuneration being independent of the premium.

The Council have appointed Mr. J. MACVICAR ANDERSON, F.R.I.B.A., 6, Stratton Street, Westminster, W., as their Assessor and Professional Adviser.

Designs are to be delivered at the Town Hall, West Ham, E., not later than FOUR p.m., on WEDNESDAY, 1st May, 1895.

Full particulars of the instructions and conditions can be obtained on application to the undersigned, on payment of a deposit of One Guinea, which will be returned in the event of the applicant either submitting a Design, or returning the instructions within one month from the date of receiving them.

By order of the Council,

Town Hall, West Ham, FRED. E. HILLEARY,
January 21st, 1895. Town Clerk.

IPSWICH.—MARCH 23.

DESIGNS are invited for the Building of a WORKHOUSE and INFIRMARY, with Specifications and Estimate. Premiums £100 and £50. My. A. F. VULLIAMY, Clerk to the Guardians.

ERDINGTON (near BIRMINGHAM), MARCH 30.

COTTAGE HOMES.

The Guardians of Aston Union invite Competitive Plans, with specifications and estimate, of Cottage Homes to be erected at Erdington, near Birmingham. The Architect who sends in the plans selected as best will be appointed Architect for the erection of the buildings, or be awarded a premium of £70, as the Guardians may decide; and he who sends in the plans selected as second best will be awarded a premium of £30.

A copy of instructions to Competitors and conditions of competition, together with a plan of the site, may be obtained on and after 9th inst. from Mr. JOHN NORTH, Clerk, Union Offices, Vauxhall Road, Birmingham, on payment of £1 rs., which will be returned on the receipt of bona fide plans, specifications, and estimate. Plans, &c., must be delivered by March 30.

TO ARCHITECTS.

DESIGNS and ESTIMATES are invited by Mr. N. Miller, of 95, Fishergate, Preston, Lanc. for a proposed FIRE-PROOF BLOCK of SHOPS, OFFICES, TWO HOTELS, &c., at a cost of from £45,000 to £50,000 (which latter sum must not be exceeded), on an area of 2,500 square yards abutting on to Church street, Lancaster road, Jackson-street, and Birley street, in the County Borough of Preston, Lancashire.

Premiums of £150, £100 and £50 are offered (in the adjudged order of merit) for the three designs which are selected as the most suitable, and which three designs will become the absolute property of Mr. Miller.

The winner of the first or any other premium will not necessarily or in consequence become entitled to carry out the work, but if he be selected to do so, the premium will be deducted from his remuneration.

A plan of the site with instructions to Architects can be obtained from Mr. MILLER, on payment of £1 rs. which will be returned to those sending in bona fide Designs.

All Drawings, &c., must be marked with a motto or device, and sent to the Borough Engineer's Office, Town Hall, Preston, and the name and address of the designer in a sealed envelope, bearing on the outside the same motto or device, to Mr. MILLER, not later than the 27th day of APRIL, 1895.

DURHAM.—MARCH 25.

COMPETITIVE SCHEMES are invited for the SEWAGE DISPOSAL of the District. Premiums £100 and £50 for Two Best Schemes. Mr. F. MARSHALL, Town Clerk, Durham.

SWANAGE SCHOOL BOARD.

The above Board invite COMPETITIVE DESIGNS from Architects for NEW SCHOOLS at Swanage.

First premium, £30; second, £15.

Mr. WALTER I. FLETCHER, F.R.I.B.A., will act as assessor. For copies of plan of site and instructions to Architects, apply to "The Clerk to School Board, Swanage," such application to be accompanied with the sum of 10s., which will be returned in case a bona fide design is sent in by NOON on the 6th day of MARCH, 1895.

APPOINTMENTS VACANT.

BOROUGH OF BURTON-UPON-TRENT.
BUILDING INSPECTOR.

The Corporation of the above Borough require the SERVICES of a competent person to act as INSPECTOR of NEW BUILDINGS and HOUSE DRAINAGE, and generally to perform the duties set forth in the schedule, a copy of which may be had from the Borough Surveyor.

The salary will be at the rate of £120 per annum, and the appointment will be terminable by a month's notice on either side.

The person appointed will be required to devote the whole of his time to the duties of his office, and to act under the direction of the Borough Surveyor.

Preference will be given to persons holding the certificate of the Sanitary Institute, or of the Association of Municipal and County Engineers.

Applications in the applicant's handwriting, stating age and qualifications, and accompanied by not more than three recent testimonials as to competency and character, must be delivered to me not later than TEN a.m. on MONDAY, the 25th instant, endorsed "Building Inspector."

Persons directly or indirectly canvassing members of the Council will be disqualified.

J. E. SWINDLEHURST, C.E.,

Borough Surveyor.

Town Hall,

February 6th, 1895.

THE BOARD of WORKS for the SAINT OLAVE DISTRICT, Southwark, requires the SERVICES of a FOREMAN of PAVIORS and SEWERMEN, at a salary of £2 a week.

Letters of Application, with not more than two testimonials, to be sent by the 22nd instant to the undersigned.

G. W. THOMPSON,

Surveyor.

Vine Street,

Tooley Street, S.E.

CONTRACTS OPEN.

TO BUILDERS.

NEW BOARD SCHOOL, ASHFORD, KENT.

The Ashford School Board are desirous of receiving TENDERS for the ERECTION of a new BOARD SCHOOL, with MASTER'S RESIDENCE and OFFICES in Victoria road, Ashford, Kent.

All Builders who wish to Tender must send their names and addresses to Mr. H. J. JEFFERY, Architect, Ashford, Kent, on or before FRIDAY, 15th FEBRUARY next. They can obtain from him on and after TUESDAY, 19th February, on payment of a Guinea, a bill of quantities.

The plans and specifications can be seen at the Architect's Office during business hours on and after 8th FEBRUARY.

The deposit of a Guinea will be returned on receipt of a *bona-fide* Tender.

Sealed Tenders, endorsed "Tender for New Board School and Residence," must be received by me, the undersigned JAMES FRASER, not later than MONDAY, 4th MARCH next.

Neither the lowest nor any Tender will necessarily be accepted.

JAMES FRASER,
No. 87, High street, Ashford, Kent. Clerk to the Board.
January 17th, 1895.

TO BUILDERS AND CONTRACTORS.

TENDERS are invited for the ERECTION of a THREE HUNDRED QUARTER MALTING, within the Borough and City of Peterborough, and adjoining the Great Northern Railway.

Plans and Specification, may be seen, and quantities obtained, at our Offices, Eldon Chambers, Wheeler Gate, Nottingham, on and after FEBRUARY 18th inst.

Tenders to be delivered on or before the 27th FEBRUARY inst., addressed to Messrs. GILSTRAP, EARP & CO., Newark-on-Trent.

The lowest or any Tender not necessarily accepted. Great importance will be attached to time limit, and class of work hitherto done by firms Tendering. Particulars of Tenders will not be published.

EVANS & SON,
Architects.

February 6th, 1895.

S. MARY NEWINGTON, LONDON.

TO BUILDERS.

NEW BATHS AND WASHHOUSES.

The Commissioners for Baths and Washhouses are desirous of receiving TENDERS for the ERECTION of BATHS and WASHHOUSES, with the necessary Offices, in Manor Place, Walworth.

All Builders who wish to Tender must send their names and addresses to Mr. E. B. TANSON, Architect, 7A, Laurence Pountney Hill, E.C., on or before FRIDAY, the 22nd INSTANT. They can obtain from him on and after this date bills of quantities upon payment in cash of Ten Guineas.

The Drawings, Specification, and Form of Contract can be seen at the Architect's office during business hours, on and after Monday, the 18th inst.

The deposit will be returned after the Tenders are opened by the Commissioners.

The Builder will be required to sign the following declaration:—"We hereby declare that we pay to the workmen employed by us not less than the recognised Trade Union rate of wages in each branch of the trade."

Sealed Tenders, endorsed "Tender for New Baths and Washhouses," must be received by the undersigned not later than Five o'clock on TUESDAY, 5th March next.

Neither the lowest nor any Tender will necessarily be accepted.

By Order,
L. J. DUNHAM, Clerk to the Commissioners,
Vestry Hall, Walworth, S.E., Feb. 14, 1895.

TO BUILDERS.

TENDERS are invited for BUILDING VILLA RESIDENCE and STABLING at Rayleigh, Essex. Bills of quantities obtained on payment of Three Guineas, which will be returned on receipt of a *bona-fide* Tender, on making application to the Architect, Mr. JAMES THOMPSON, Cliff Town road, Southend-on-Sea.

Sealed Tenders to be delivered at the Architect's Office on or before THURSDAY, the 21st FEBRUARY.

No pledge is given to accept the lowest or any Tender.

Dated January 28th, 1895.

TO BUILDERS.

The Commissioners of H.M. Works and Public Buildings are prepared to receive TENDERS for the ENLARGEMENT of the HEAD POST OFFICE at Portsmouth.

Drawings, specification, and a copy of the conditions and form of Contract may be seen on application to the Postmaster.

Bills of quantities have been prepared for the use of the Builders by Mr. HARDCASTLE, of No. 5, Old Queen street, Westminster, and, together with forms of Tender, may be obtained at this Office, on payment of the sum of One Guinea. The sum so paid will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Commissioners do not hold themselves responsible for the accuracy of the quantities; nor do the Commissioners bind themselves to accept the lowest or any Tender.

Tenders are to be delivered before TWELVE o'clock noon, on TUESDAY, the 5th proximo, addressed to the Secretary, H. M. Office of Works, &c., 12, Whitehall Place, London, S.W., and endorsed, "Tender for Portsmouth Head Post Office, Enlargement."

H. W. PRIMROSE,
Secretary.
H. M. Office of Works, &c.
February 11th, 1895.

TO BUILDERS.

NORTH SURREY DISTRICT SCHOOL, ANERLEY, S.E.

The Managers are prepared to receive TENDERS for ADDITIONS to DORMITORY (Boys Side) and OFFICE FITTINGS at the School.

Copies of the specification and drawings can be seen on application to the Superintendent on the premises.

Tenders to be sent to me at the School, marked "Tenders for Dormitories, &c.," not later than SATURDAY, MARCH 2nd next.

The Contractor whose Tender is accepted must be prepared, if required, to find two approved sureties to enter into a bond (to be drawn up by me) for the due performance of his contract.

The Managers do not bind themselves to accept the lowest or any Tender.

H. J. CHALDECOTT,
Clerk to the Managers.

The Builders' Journal.

Ewan Christian. At the ripe age of eighty years, full of honours, and with the best secular work he has ever attempted almost completed, Ewan Christian has gone the way of all flesh, and his host of friends in the Architectural world will know him no more. Mr. Christian's chief works were his church restorations, and he has restored more churches—under the Ecclesiastical and the Charity Commissioners, for whom he worked religiously for very many years—than any other six men in England. His principal restoration, if one would pick a solitary instance out of many hundreds, was unquestionably the restoration of Southwell Minster, and the rebuilding of its tower; but his staircase at the National Gallery, and the important additions to the building which have been for several years gradually growing to completion, and which will undoubtedly form a magnificent home for the National Portraits which have been buffeted about the world, to our great dishonour, will call him most to the memory of architectural London. We only hear of his death as we are going to press, time enough, however, to express our sorrow at the loss of such an eminent Church Architect, and such a polished gentleman. Mr. Christian is but another victim to the fearful weather of the past month. He caught a chill a few days ago, and in spite of all that medical skill and nursing could do, he succumbed through exhaustion.

Water at Last. THERE can be no two opinions over the welcome news that comes from the House of Commons debate of last Friday. The details under which the London County Council become possessed of the Lambeth Water Works Company are of not much importance, so long as the possession of this and every other water monopoly is obtained on

equitable terms, and we may safely leave it to the Select Committee to arrange matters fairly. But that the water monopolists are at last cornered is good news indeed. Of the constitution of the County Council, we have little pride; of its rabid political tendency, we have little hope; but the County Council is a better monopolist for the welfare of the community than a Limited Liability Company, and we welcome the thin end of a wedge which is going to place the manipulation of the City's water supply into the hands of the Municipality. We shall

Association who happens to be also the editor of this journal, all the other architectural journals, which usually send representatives to the meetings of the Association, formally absented themselves. Whom are they supposed to punish by these tactics? Possibly their own readers, who may think they have a right to expect some report of a paper which was considered by the meeting as an important one; certainly not the reader of the paper, who, they may take it on the best authority, is entirely indifferent whether his name appears in their columns or not, and would not have even been aware of their defection had not his attention been drawn to it."

We have never in our twenty years' experience of class journalism met with a more foolish and tactless admission. The obvious conclusions which men will draw from the stupid paragraph needs no further exposure by us, for the sore on the back of the editor's head is a very angry one we dare swear could we but see it. But of all this we care very little, and it interests us less. Our self imposed duty is to uphold the dignity of *The Builder* and to save its editor from falling again from the pedestal he should undoubtedly occupy. *The Builder* is, or is not, the leading Architectural journal in England. Its circulation is extremely limited, and perhaps there are not fifty individuals who religiously read it from beginning to end, but there is a severity and a profundity about it which forbids any antics with its reputation. It may be commercially unwise for us

THE ROYAL UNITED SERVICE INSTITUTE—WHITEHALL FRONT.

get better water, more of it, and it ought to cost us a great deal less than it does at present. There are other monopolies to follow.

Professional Dignity. THE Editor of *The Builder* has one grievance amongst many, which he has publicly commented upon in the current issue of his journal. He says: "It is amusing to note that on the occasion of the reading of a paper by an old member of the Architectural

to publicly uphold the reputation of our elder contemporary, but we are always honest in our convictions and fearless in our loves and hatreds, and our affection for *The Builder* is not to be dimmed by the erratic behaviour of its conductor. To get to the point of our keenest sorrow we regret that the reader of the paper to the young men of the Architectural Association did not leave it to us or to some one else to protect the etiquette of professional journalism. We loathe with a

dread loathing the spirit which induces proprietors of certain papers withdrawing their attendance from a meeting at which the editor of a contemporary is delivering the lecture of the evening. It is whispered to us that there be reasons for such abstention, and, although, we think of much, we do not listen to whisperings. *The Builder* is as much above any of its contemporaries in academic learning and professional prestige as the Sun is above the planet upon which mortals crawl, and its present Editor is, perhaps, the most able man who could be found to fill its chair, and, therefore, the keynote of its existence should be that of courteous tolerance to all its contemporaries. There should be no spitting and scratching and gnashing of teeth, which characterise the minions of most rival newspapers. They lie against each other in the most sublime fashion, they curl their lips and dip their noses when they pass each other in the public streets, and when these shortcomings commence to be shared by the principals of respectable journals, then it is high time that the conductors of "THE BUILDERS' JOURNAL" gave them a lesson in professional decency. The particular paper which was read by the Editor of *The Builder* before the Architectural Association was entitled "London Bridges Architecturally considered," and it appears *in extenso* in the current issue of *The Builder*. We wrote a personal letter to the author, asking the loan of the drawings which were exhibited during the evening, so that we might illustrate his paper; and this is his personal reply:—"In regard to my own paper at the Architectural Association, the other journals (in a fit of journalistic spite, I presume,) absented themselves from the meeting, a matter to which I am entirely indifferent; but the result of that is, that the paper will be published in *The Builder* only, and I decline to permit you to publish it, and if you reprint any part of it from *The Builder*, I shall obtain a Chancery Order to stop the sale of the paper." What courtesy! what goodness of heart! what dignity! As a prosaic matter of fact we were represented at the meeting, made shorthand notes of the business transactions and of the discussion which ensued, we did not report the paper itself, because it is customary for readers of papers before public audiences to hand their M.S. to the pressmen present, or otherwise to supply them with authenticated copies, and to that customary courtesy we depended for our matter. It looks as if the representatives of the other professional journals knew what was in store for them. However, back upon his pedestal we wish to see the editor of *The Builder*, he will be less ignoble in his proper place, and the friction of the world will irritate him less. The next time he addresses a professional meeting, we shall be there in force to report his every word, to defy his Chancery Orders and the other vapourings of a bearish disposition. For several years he has ridden rough shod over the arid plains of Architectural journalism, and his compeers have fallen back at his approach. But another Richmond is in the field, mounted on a modern charger, equipped with the latest devices of his craft, and fearsome of none. There must be an end to bluster and to bounce, else the snug little commercial enterprise of Catherine Street must be taught a lesson it is not likely to forget.

Ourselves Again. We are better able now to gauge the brilliant success of "THE BUILDERS' JOURNAL," and yet we are without much evidence of its popularity, which will reach us next week. From Scotland, from Ireland, from Wales, and from every county in England come letters of astonishment and praise, until we

are almost tired of reading the continuous flow of commendation and approval. One fact we are distinctly pleased to gather—that our advent will not materially affect those high-priced weeklies which, by their beautiful plates, have secured a permanent foothold—even if it is superficially small—in the appreciation of architecturally disposed individuals. Our good printing and our marvellous price, and the enterprise and capital which back them up, has carried us over the entire field of Architecture and Building, and we shall not stop until we can announce a class circulation equal to the combined circulation of all our high-priced friends put together. Architects of eminence have welcomed us. Provincial Architects who but seldom purchase our contemporaries, have become our good subscribers, and presently there will not be a single town in the United Kingdom where "THE BUILDERS' JOURNAL" cannot be found. Complaints too reach us of the inability to obtain copies. The inability will not exist if the applicant will merely order his copy from his bookseller or his bookstall, and see that he gets it. Any newsagent in the kingdom will procure copies from their wholesale house or Messrs. Smith & Son will have them on sale wherever they are wanted. Failing that, a Postal Order for three shillings and three pence sent to this office will secure the Postal delivery of a copy every week for half a year, but we much prefer that the copies should be procured through the newsagent.

A kind wish from NORMAN SHAW, R.A.

Yours very faithfully,
Norman Shaw

The Acquisition of Workmen's Dwellings. A BILL that should have a very material interest for the English Builder was ordered to be printed by the House of Commons on the 8th of this month. It resembles one of those inventions whose simplicity causes us to wonder why we had not forestalled the author by a previous production. Mr. Wrightson, who was returned to Parliament for the first time at the last General Election as the Conservative Member for Stockton-on-Tees, and who is one of the partners in the firm of Head, Wrightson & Co., profiting by the principle of Mr. Balfour's Irish Land Purchase Act, has drafted a measure with a similar objective for the working classes of England and Wales, who may wish to be assisted to an acquisition of their own dwelling-houses. His scheme has the exceptional merit of combining two generally opposed political elements. It is both socialistic and individualistic. For while it involves State aid, it demands thrift and industry from the State constituent. Mr. Wrightson is thus a Parliamentary reaper, who, having gone out to reap, has not stayed, like many of his fellow-legislators, to unravel the cornstalks. He has seen quickly and used quickly his opportunities. Two diverging political currents have been ingeniously turned into one broad river that will, we think, carry us a long way towards the solution of a great economic problem.

Mr. Charles Booth's "Life and Labour of the People," which is a sort of doctor's melascope that empowers us to see into the very stomach of the housing question in the

Metropolis, and to photograph and map out its diseased parts, gives us admirable guidance on the subject that Mr. Wrightson has taken in hand. Indeed, it would appear that the member for Stockton has allowed himself to be largely influenced by it. The book tells us that a big proportion of working class people in London—and we may presume that the same thing holds good of the population in other large towns and cities—is averse to the corporate life of the block system, and it asks landlords to pause before clearing away small houses and erecting large blocks. It happens, however, by reason of the provisions of the Housing of the Working Classes Act, 1890, that the landlord is not always able to avoid the restriction of the small house, and naturally, in crowded neighbourhoods, where space is valuable, he makes the most of what is allowed him between the earth and the sky. The four-storied block will pay him better than the two-storied cottage, and the philanthropic instinct, if it be present, bends to the commercial consideration. The Act of 1890 is, therefore, favourable in certain districts to the existence of the block and to the elimination of the small house. Another cause which operates in the latter direction, not only in London, but also in the more pretentious country towns and provincial cities, is the increasing demand for factory and workshop space. The dwelling houses in courts and alleys are mostly held on leases that are near expiring; the buildings are old and very often seriously delapidated; and as re-erection accompanies the issue of a new lease, and the sites are adjacent to industries, workshops, factories and offices, from the fact that they are more valuable and easily let, frequently, in such situations, replace the dwelling-house. This is a process that will be accelerated in the metropolis by the new building Act which came into force this year; for many examples of the class of house to which we refer are all front, and do not afford the rear space and facilities for the opening of windows into the external light which have now become obligatory in domestic habitations. This change from dwelling-house to workshop and office must, in the course of time, displace in certain centres a considerable number of the working classes. The proven unsuitability of the block system and this continuous displacement, to say nothing of the extra provision that the future will need, owing to excess of births over deaths, convert the erection of the small house into a pressing, if not imperative, desideratum. There can be no question as to the popularity of the small dwellings with the working classes. Investigation, such as Mr. Booth has conducted, and the experience of companies like the London Provident, place it beyond all doubt.

It is, then, this small house which the working classes desire that Mr. Wrightson's Bill will enable them to purchase. It is a short measure of six sections. Under its provisions the local authority may borrow money from the Public Works Commissioners at not less than $3\frac{1}{2}$ per cent. to aid workmen, or any person whose income does not exceed £3 per week, to purchase the freehold or leasehold interest (the latter must have at least 70 years to run), in the dwelling-house in which he resides or intends to reside. Advances, however, are not to be greater than an eighth of the rateable value of the district in which they occur, nor is any sum exceeding £150 to be advanced to any one workman, nor any sum to any one workman in respect of more than one dwelling-house. To this extent the Act is socialistic; but there is a provision in Section 3 which clothes it with a contrary character. This provision calls upon the working man, as a condition of the advance, to contribute one-fourth of the purchase money, the whole of which must be repaid within 30 years

There are also provisions governing insurance, sale, sub-letting, overcrowding, and employment carried on in the house by the occupier. Failure to keep up the repayments of the money advanced invests the local authority with the right to sell as it may deem desirable, and if the proceeds of such sale do not cover the advance and attendant expenses, the balance unpaid is to be treated as a debt due to the local authority and is recoverable accordingly. It will be noticed that the proviso as to the length of the leasehold interest purchasable with the advance, excludes from the operation of the Bill a very large class of existing property. The effect of the Bill, as we have said, is of material interest for the builder. It will confront him with an extensive demand for a special kind of dwelling, somewhat similar to the freehold houses which are owned by American workmen, and which are so marked a feature outside the towns and cities of the United States. Before it gets through the Legislature, Mr. Wrightson's Bill will doubtless meet with a great deal of criticism, and in some particulars, such for instance, perhaps as the allocation of the working expenses of the Act, may be amended; but it will hardly encounter serious opposition. It has the approbation of all parties in the House of Commons; we have, in fact, the best of grounds for the assertion that, if not in this, at least early in next Parliament, be the party in power Liberal or Conservative, the Bill will either be adopted as a Government measure, or the Government will do what, for all practical purposes is the same thing, assist in its passage. Its becoming law will mean a wanted and widespread stimulus to the building trade, the relief of congested populations in big towns and cities, the attachment of the rural workman and his children to the country, and consequently the stoppage of their migration to the already overcrowded industrial centres. Above all, it will benefit or have the indirect tendency of benefitting those poorer sections of the community who think, as Mr. Ruskin has terribly said, "if there is a next world they will be damned, and, if there is not, they are damned already."

THE ROYAL UNITED SERVICE INSTITUTION.

THE Royal United Service Institution, it must be acknowledged, has had in its

later years a rather chequered existence. Founded in 1831, when William IV. was king, and receiving its charter of incorporation in 1860, at the hands of Queen Victoria, it has for a long time past had its abode in two dull, dingy, and

rapidly-decaying buildings—the entrance to which is shown in our initial letter—in what was formerly Whitehall yard, but is now dignified by the title of Horse Guards avenue. In 1871 the Crown gave the institution notice to quit premises which were ill-suited alike for the purposes of meeting and for the display of its unique collection of naval and military trophies. Thereafter the institution lived year after year under apprehension of eviction, and under deadly fear of having to seek something akin to Land League shelter for the warehousing of its service *bric-à-brac*. A sense of security was, however, restored when, at the end of 1890, her Majesty paid the highest

possible compliment to the work of the institution by granting it the use of the Banqueting Hall—all that is left of the once famous Whitehall Palace—for museum purposes. By a stroke of good fortune the council were also able to secure a long lease of the site once occupied by Dover House stables, and adjoining the southern end of the Banqueting Hall. Here they have erected as there future headquarters a building which, while in no sense an extension or continuation of the Banqueting Hall—for it was specifically directed that the latter was neither to be architecturally compromised nor structurally altered—has the advantage of being next door to, and communicating with, this famous and historic building.

The new institution, designed by Messrs. Aston Webb and Ingress Bell, was opened by the Prince of Wales last week. Constructed of brick, Portland stone, and granite, and fire-proof throughout, the new building has its principal or western front towards Whitehall, but it has also an important eastern elevation towards Whitehall Gardens, on which the lecture theatre abuts. The latter, which is on the ground floor, is spacious and lofty, and will be capable of comfortably seating

There is a passenger lift to the principal floors, to say nothing of "coffee" and coal lifts, while the electric light has been installed throughout. Altogether the new building is about as complete and as agreeable a contrast to the institution's former headquarters as could be conceived. Mr. W. S. Frith is responsible for the sculptured work, and the building itself was entrusted to Messrs. Mowlem & Co., who have carried out their work most satisfactorily.

While the members of the Royal United Service Institution are to be specially congratulated upon their migration, the public will probably take no little interest in the event, since, coincident with it, they have, at a cost of sixpence, access every week-day, except Wednesdays, to innumerable naval and military treasures. Hitherto, it has been possible to view the institution's museum by writing to the secretary for his permission, but in the crowded rooms of Whitehall yard a due appreciation of the closely-packed relics was all but impossible. Now, however, there has been a sifting of the wheat from the chaff, and all that is best and most valuable in the vast store which the institution has accumulated has been removed to the

THE ROYAL UNITED SERVICE INSTITUTION—WHITEHALL GARDENS FRONT.

nearly 400 persons. The lectured, it is worth noting, are not to be staged at that precipitous angle which scholastic fashion has hitherto favoured, and Alpine experience will no longer be an essential for obtaining a seat, as was the case at the old institution. On the main floor, which is on the level of the neighbouring Banqueting Hall, is a room intended for the use of the council, and other apartments which will be utilised for secular purposes. In the council room, as in other parts of the building, wood-carvings, which are reputed to have formed part of Whitehall Palace, have been appropriately utilised. Tradition has it that when the palace was destroyed by fire Sir John Vanbrugh, famous as the architect of Blenheim, rescued various tit-bits from the *débris*, and employed them in the construction of a house on the site which the institution has lately quitted. On the first floor there is a large newspaper room, the length of the Whitehall frontage, and behind it and over the theatre, a handsome and well-lighted library, capable of accommodating about 30,000 books. Other floors furnish writing, reference, and topographical rooms.

Banqueting Hall, there to be seen to the best advantage. In these circumstances, and in view of the fact that the preparation of the hall and its crypt, together with the new buildings, has cost the Council about £25,000, the public will hardly grudge the small charge levied for admission. Built by Inigo Jones, the Banqueting Hall itself is a structure worth more than the money to visit. Historically, its greatest claim, probably, is that through one of its windows Charles I. was led forth to execution, and by a singular coincidence, yesterday's private view was fixed on the anniversary of that event. Artistically, the feature of the building is its ceiling, which is embellished with the matchless work of Rubens. It is said that Van Dyck was to have executed a series of mural paintings for the hall, representing the ceremonies of the Order of the Garter, but the fact that this work was never carried out probably made it the more easy for George I. to convert the building into a Chapel Royal—a purpose which it served for many years. Some 111 ft. in length, and 55½ ft. both in width and height, and possessing an excellent light, the hall makes an ideal museum.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
26th February, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

THE Council of the Association of Municipal and County Engineers have just decided upon several provincial meetings. It is intended to pay a visit to Stockport on April 27th, where an important sewerage scheme is now being carried out according to the plans and advice of Mr. A. M. Fowler, of Manchester. The main sewer is 7 ft. in diameter, and settling-tanks and 95 acres of land are provided for treating the sewage. The main sewer, which possesses the novel feature of crossing under the river no less than four times, is laid at a depth ranging from 30 ft. to 60 ft. Other interesting items on the programme will be the inspection of new steel and other bridges. May will be a busy month. The members will assemble at Brighton on May 4th, at Cardiff on May 11th, at Plymouth for two days' visit to important works on May 17th and 18th, and in Manchester on 25th of the same month, when the Thirlmere Waterworks will be inspected.

MEMBERS of the Society of Architects assembled at St. James's Hall on Tuesday night, under the chairmanship of their president, Mr. E. J. Hamilton, who had the support of Sir Francis Jeune, Archdeacon Farrar, Canon Browne Mr. Wyke Bayliss, Mr. G. Candy, Mr. Atherley-Jones, M.P., and Mr. Montefiore (the secretary). According to the Chairman the growth of the Society had been remarkable in more senses than one, for its 500 members were scattered all over the globe. A high tribute to the profession fell from the Archdeacon of Westminster, who described architecture as the handmaid of religion, for its greatest triumphs had been wrought in the service of the Church, while architects worked hand-in-hand with the servants of religion. The postprandial oratory, however, was not wholly confined to this one subject, and

MOSAIC FROM THE GREEK CHURCH,
BAYSWATER.

Professor Banister Fletcher, in proposing "The London County Council," was not speaking architecturally when he declared that the body in question would make London the first city in the world. Satisfaction was expressed that the Bill for the Registration of Architects which Mr. Atherley-Jones was promoting had been read in Parliament.

THE Dean and Chapter of Canterbury Cathedral, and representatives of the Consistory of the French Protestant Church in the crypt, have at length come to an understanding as to the removal of the French Church into the more lofty and lighter portion of the crypt, known as the Black Prince's Chantry. The Consistory having accepted the amended plans for the fitting up of the chantry, the alterations will be forthwith carried out under the direction of Sir Arthur Blomfield, A.R.A., and will include the removal of a modern wall, which has long been regarded as a barbarism.

MAIDWELL HALL, Northamptonshire, the residence of Mr. Reginald B. Loder, was last week totally destroyed by fire. An estate workman was employed in nailing felt to the inside of the roof to keep out the cold and draughts. The man accidentally knocked over the candle with which he was working, the felt became ignited, and in a few minutes the flames had spread along the roof to half the house. Only three small rooms at the north-east corner of the building were saved from the flames. The house was built in 1637, and was restored by the late Sir Robert Loder in 1885. It was a three-storey building, and measured 150 ft. by 120 ft. It was rich in oak panellings and carvings, all of which were destroyed. The furniture is damaged only by removal. The loss is between £15,000 and £20,000.

Two sets of public baths are in course of erection at Leeds, from plans by Mr. Walter Hanstock, of Batley. At the baths in Kirkstall road there are to be two main entrances, one to the first-class and the other to the second-class swimming bath. Between these entrance-doors is the office. Above the office is the manager's house, and to the rear the laundry. Twenty slipper-baths are to be provided, five of which will be set apart for ladies. All these different baths are arranged on one floor level. The size of the second-class bathroom is 89 ft. by 45 ft., with water level 75 ft. by 30 ft. On both sides and at the end of this large room is a spectators' gallery, which will accommodate 200 or 300 people. Under the gallery are the dressing-boxes, which, when finished, will be divided from each other by slabs of polished slate. The bath has a concrete shell; the sides will be lined with white glazed bricks, and the floor with glazed white tiles, with the usual couple of black bands. The side of the room containing the first-class swimming bath is 73 ft. 6 in. by 33 ft. 6 in., with a water measure of 63 ft. by 24 ft. Here there will only be a gallery on one side, underneath which will be the dressing-boxes, polished white marble slabs being used for the divisions. Both the rooms containing the swimming baths will be lighted by windows at one end and by skylights. On the ground floor beneath all the bathrooms is a crypt, in which all the numerous water and steam pipes are exposed. Plaster and woodwork are avoided throughout the building, and thus the cost of repairs is reduced to the minimum. The external walls of the Kirkstall road building are faced with red pressed bricks. The Union street baths are built on exactly the same principle. The contracts in respect of the Kirkstall road baths amount to £6,982 12s. 4d.; this does not include the cost of the land. The total amount of the contracts in regard to the

Union street baths is £6,686 16s. 1d. Both sets of baths will be opened in June next.

THE modern stained glass window is described by Mr. Day as produced by painting on white (clear) glass in colours, and then firing them in—a process more appropriately termed enamelling. Its origin dates from the sixteenth century. The objection to it is that the painted colours have not the strength or brilliancy of pot metal, and the enamel is not lasting. Work of this class done in the seventeenth century only remains in a state of ruin and shabbiness. The enamel is simply finely powdered pot metal applied to the glass with a brush, and then fused into it. To make the fusion more ready, a flux of borax is mixed with the powdered pot metal, but this lessens the adhesive properties of the enamel. Changes of temperature cause the glass and enamel to expand and contract; this they do at different rates, with the result that the latter chips off. The old brown paint of the mediæval artist was not of this character; it was actually made to sink into the glass it adorned by intense heat, and remained there a part of the glass itself, not merely an adhesion to the surface.

MOSAIC FROM THE GREEK CHURCH,
BAYSWATER.

THE Society of Arts announce an offer of (1) a prize of £20 or a gold medal for the best reproduction of a selected picture by a photogravure process. (2) A prize of £10 and a silver medal for the best photographic negative of a selected picture suitable for reproduction by photogravure process. Applications for orders to photograph the "selected picture"—Mulready's "Choosing the Wedding Gown," at South Kensington Museum—must be made to the secretary before March 30th next. The plate on which the photos are to be taken must be 12 in. by 10 in., and the finished picture of the same size. The competition is limited to British subjects. Full particulars are given in No. 2,204 of the *Society of Arts Journal*.

ON Jan. 4th, says *The Architect*, Messrs. Hollams, Sons, Coward & Hawksley wrote to Mr. Alderman Vaughan Morgan, treasurer of Christ's Hospital, on behalf of Sir H. W. Peek, explaining that there appeared to be a general opinion that the proposed removal to Horsham was undesirable, and offering the hospital 100 acres of well-timbered land at Wimbledon, with a frontage of about two-thirds of a mile on Wimbledon Common, on moderate terms. They added that Sir Henry Peek would be willing to entertain a proposal for payment of a considerable portion of the purchase money by way of permanent rent-charge, and that he was actuated rather by a desire to benefit the charity than to dispose of the property, which was obviously suitable for immediate building operations. To this Mr. R. L. Franks, clerk of Christ's Hospital, replied on January 9th, stating that the offer had been submitted to the Council of Almoners, and that he had been directed

to decline it. Messrs. Hollams, Sons, Coward & Hawkley wrote to Mr. Franks on January 18th, complaining that no reason had been given for declining the offer, and adding that Sir H. W. Peek was prepared to sell the property at Wimbledon at the same amount per acre as was paid by the Mercers' Company, with the sanction of the Charity Commissioners, for the site of St. Paul's School at Hammersmith, and that he would, although he felt it to be a very undesirable property, relieve the charity of the property at Horsham for such sum as valuers mutually appointed, or their umpire, might fix as the value. He would also, subject to deduction of the value of the Horsham property to be thus acquired by him, accept payment of the whole of his purchase money by way of perpetual rent-charge, following the precedent sanction by Parliament for compensation to Lord Spencer from the inhabitants of Wimbledon. The firm added that this course would enable Christ's Hospital at once to agree with St. Bartholomew's Hospital in respect of a substantial portion of the Newgate Street site, payment for which would provide funds for the requisite new buildings for the school, and, in the meantime, there would be two large houses in which part of the work could temporarily be carried on. To this Mr. Franks replied on February 6th, stating that the letter had been read to the Council of Almoners, and he was instructed to reply that the Council, having unanimously decided to build the schools at Horsham, could not re-open the question. Sir Henry Peek, in another letter, says that he still hopes for the sake of the future of the school that a better site than Horsham may be obtained, and that he cannot understand the inertness of the Charity Commissioners in the matter.

WE have had the pleasure of a visit from Mr. Arthur G. Walker, the artist of the mosaics, in the dome of the Greek Church at Bayswater, and whose very clever work has been represented in our two pre-

MR. WALKER IN HIS STUDIO.

ceding issues, and is completed in the present one, by means of the half tone blocks made from photographs of the actual mosaic panels. Mr. Walker has explained to us the conditions under which he obtained the commission for this work—conditions, which, invariably lead to the wrong man getting the praise for work he never did. It appears that

Mr. Mecenero was "merely" the contractor for the mosaic work, and obtained the contract on the merits of a sketch which Mr. Walker made for him. Mr. Walker was straightway commissioned by Mr. Mecenero to prepare the designs, and how, under such conditions, such good work has resulted is to us a conundrum. On this page is a picture of Mr. Walker in his studio, engaged upon the cartoon of our Lord, which forms the centre feature of the scheme.

ON Saturday Lincoln's Inn Fields reverted to the public for all time, thanks to the exertions of the County Council. How the pleasaunce was filched from the general community and passed into private hands is one of those mysteries which nobody has ever been able to find out. But it did; and for long years—at a time, too, when it was perhaps, even more wanted than it is now—it remained closed to all but a select few. Henceforth it will be free to the world. The Square forms part of some 20 acres of meadows which were turned into a building estate in the year 1657, and what were formerly the mansions of Prime Ministers, Lord Chancellors, and nobility of every degree, are now split up into innumerable chambers and offices. Major Sexby, the chief officer of the Parks Department has, in accordance with his usual custom, prepared an admirable history of the Gardens. The chronicles show that in the early times the Fields were the scene of many executions, and that even now the Square teems with buildings of historic interest. On the east side of the Square is an approach from Chancery Lane, the gateway of which bears the date of 1518. Over this red-brick portal Oliver Cromwell lived for some time, and tradition relates that Ben Johnson worked as a common bricklayer in the erection of the adjoining wall about 1617. Milton, it is stated, moved, in 1645, from Barbican to a smaller house in Holborn, which opened backwards into Lincoln's Inn Fields. The list of names which have made the Square famous is a lengthy one, and includes several Lord Chancellors, Chief Justices, and Sir William Blackstone among the legal world, the celebrated Duchess of Marlborough, John Locke and William Pitt. Nell Gwynne lodged in Lincoln's Inn Fields when her first son was born.

THE inn itself derived its name from Harry Lacy, Earl of Lincoln, in the time of Edward I.: and before him there was a monastery of the Order of Black Friars here near to "Oldbourne," which is Holborn. The ancient name of the spot was "Fickets Field," and in 1657 it was divided into two parts—that on the east called "Cup Field," and that on the west called "Purse Field." Quarrels were always taking place as to the right of entry and of pleasure, but the lawyers stuck to their rights on behalf of "the clerks of the Chancery, apprentices, students of the law, and citizens of London." One Roger Leget tried to drive these classes out of the space with "iron engines called caltrappes, privily laid and hid about."

This is an implement consisting of a ball of iron or wood, with iron spikes stuck in it, justly called "the devilish calthrop"; and things must have gone pretty far when the Fields were strewn with these amiable inventions. The nefarious Roger, however, was sent to the prison of the Fleet, "there to expect the King's grace," which he doubtless afterwards got pretty hot; and

being once well walled in with fair mansions and offices, the "Cup Field" and "Purse Field" were brought at last into "such sweetness, uniformity, and comeliness as they could possess" by no less a person than Inigo Jones.

It was said that the famous architect, in laying out the square, gave it the precise area of the base of the Great Pyramid of Egypt, but this is a mistake. However, without any such fanciful measurement, the spot bristles with interest. An old rag-and-bone shop at the south west corner, pointed out as the veritable Old Curiosity Shop of Charles Dickens, links it, as it were, to modern romance. By many a memory it belongs implicitly to British history. The fourteen conspirators who plotted to assassinate Queen Elizabeth and set free Mary Queen of Scots were executed here. It was known as the Babington Plot, and they were all "hanged, drawn, and quartered on a scaffold of timber in Lincoln's Inn Fields." In 1683 Lord William Russell was executed here on the charge of being concerned in the Rye House Plot. Later on the place became a haunt of mendicants and bad characters, who asked alms by day and robbed at night. The "Mumpers," and "Rufflers" of Lincoln's Inn Fields were, indeed, only too well-known, and Gay, in his "Trivia," warns the citizens against passing here by night. At this time the grounds lay open, but in 1733 a boy exercising a horse rode over the Master of the Rolls, and the Law vindicated its dignity by getting a rate levied and putting up the iron railings which have since too effectually made the green precinct a forbidden paradise to the children of the neighbourhood.

MOAIC FROM THE GREEK CHURCH BAYSWATER.

For some time past the question of strengthening their organisation has been under the consideration of several of the leading Master Tradesmen Associations in the larger cities and towns in the country. The movement had its origin with the Edinburgh Master Builders' Association, who proposed that the various employers' organisations throughout the country should be affiliated much after the manner of the existing operatives' societies. With the object of bringing the proposal under the notice of employers in Dundee a deputation consisting of the president, vice-president and another member of the Edinburgh Association visited the city the other day and met the members of the Dundee Builders' Association, which is composed of masons, joiners and plumbers. They fully explained their proposals, and afterwards, says the *Dundee Advertiser*, an interchange of opinion took place. It was then decided that a special meeting of the Dundee Association should be held to consider the matter. This meeting was held in Mathers's Hotel. There was a large attendance, and Mr. Thomas C. Stocks, the president, occupied the chair. General sympathy was expressed with the proposal of the Edinburgh Association, and the meeting decided to give it their warm support. In accordance with this resolution,

the following deputation was appointed to attend a meeting of representatives of Master Associations to be held in Glasgow shortly, when steps are to be taken to form an organisation on the lines indicated: Messrs. T. C. Stocks, J. B. Hay, Thomas Macaulay, William Bennett, D. P. How and Thomas Craig. Mr. W. Farquharson was also elected to attend the meeting as representing the master plumbers, and it was further agreed to ask the master plasterers to send a delegate. The proposal to have a forty-eight hours' week, which is at present agitating trade circles in the Metropolis, was also under consideration. It was decided unanimously to resist the movement, the Association being of opinion that it was in the interests of the public, as well as of those more directly concerned, that the fifty-one hours' week should be maintained.

PETWORTH HOUSE is one of the most interesting country seats that can be found in the South of England. Standing in the midst of an undulating and well wooded park, fourteen miles in circumference, it occupies the site for an ancient castle, built in the reign of Henry I. For five centuries it was in the possession of the Percy's, Earls of Northumberland, the heroine of that tragic episode, in which her second husband, Tom Thynne, of Longleat, was murdered by Count Königsmark at the corner of the Haymarket. The far from disconsolate widow, three months later, married the "Proud Duke of Somerset," who raised the greater part of the vast edifice that now looks over the Sussex Weald. The only child of this union, a daughter, carried the mansion and the estates into the Wyndham family, of which the Earls of Egremont were for about a century the distinguished heads. On the death of the fourth and last Earl, in 1843, the property was left to the present Lord Leconfield's father, Mr. George Wyndham, who was raised to the peerage. Petworth is famous for the magnificent paintings that line all its stately chambers, and illustrate every period and school of art from Andrea del Sarto and Van Eyck to Turner and Leslie. Grinling Gibbons adorned the dining hall with his choicest carved work, and the great staircase was decorated in the most approved style of the eighteenth century by the Frenchman, Laguerre. Royal visitors in plenty have been entertained in this noble dwelling, but not the least remarkable party was that which met here in 1814, and included the Prince Regent, the Czar, the King of Prussia and other illustrious allies.

We are sorry that at present we cannot continue our remarks upon Professor Aitchison's lectures to the Students of the Royal Academy. It appears that the copyright of these lectures—at any rate, we are told so—is the property of *The Builder*, from which we took the substance of the lectures. We are led to believe that this copyright has been purchased, but it is our intention of offering an advanced price over our contemporary, if by that means the copyright can be destroyed, and the lectures thrown broadcast over the land for the benefit of all. We are requested by our contemporary,

whose position as the leading professional journal has been most seriously shattered by our wonderful success, and who, no doubt, has been clever enough to acknowledge it, to admit, that the resumé of the Institute papers published in our last number was taken from its pages, and we, in the best possible good nature, make the admission.

CONCERNING FANS.

THE fan is not made to say much in England. It says far more in Spain, and as an instrument of conversation is second only to the tongue, and, perhaps,

ST. BARTHOLOMEW THE GREAT—NEW SOUTH TRANSEPT.

superior to the eyes. But it is in Japan that the fan has attained its highest development as an accessory of life and an essential of civilisation. There the fan is a much more serious object than it is in Europe. Since the sixth century it has been a part of the national costume. Formerly, every fan belonging to every rank had its meaning, and was used in a particular way, according to a strict code of etiquette. The flat fan had various shapes. The one familiar to us, the folding fan, or *agi*, is said to have taken its shape from the sacred cone of Fusi-yama. Certainly, the *agi* were formerly used as Court fans, and were hung with silken

flowers, and every great family had its peculiar flower and hue, so that the fan really served the purpose of the armorial coats of Europe. The fan, too, had its place in war. The war fan, invented in the eleventh century, was made of iron and leather—no coquette's toy this—and was carried by the commander, perhaps partially as a shield and partly for signaling. Folding fans served the purpose of ensigns. Naturally, the fan held a conspicuous place in the religious ceremonies, and the *mita agi*, the giant fan, was carried in processions in honour of the sun goddess. The fan has its place in religious exercises still. Preachers accentuate their points by sharply opening and shutting their fans. We have heard of the lily-white cambric handkerchief being effectively used for a similar purpose by English divines of the earlier half of the century. But the handkerchief has given way to the embroidered stole now. Art is employed on fans in Europe, but in Japan they are made the medium of literature also. There are album fans on which poems are written, and many an old legend is perpetuated pictorially on them. Japan is becoming scientific and utilitarian, so it is not surprising that of late, fans have been made to disseminate knowledge by having maps of the provinces engraved on their surfaces. These fans are probably used by Government functionaries, and most likely in the schools. For all classes have fans peculiar to themselves, dancers, jugglers, children, even dolls. The tea fan was formerly used as a tray for handing cake. Another domestic fan, of a humbler sort, is the strong flat paper one used as a bellows for the kitchen fire of charcoal. There is a water fan made of bamboo, to be dipped in water for the sake of coolness. There is the revolving white fan, which whirls around its stick; and there is a wicked fan whose case contains a dagger. The fan punctuates Japanese life in all its stages. It is, indeed, looked upon as the emblem of life. The rivet is the start, and the spreading surface the diverse paths widening out into futurity.

MESSRS. DENNY, MOTT & DICKSON, of 165, Fenchurch Street, London, teak and general timber importers and merchants, have opened a branch house at Queen's Buildings, 11 Dale Street, Liverpool, under the management of Mr. Charles Temple Greene.

THE old hall at Whiteley, near Newcastle-on-Tyne, is about to be converted into a hotel, and the estate, with the exception of five acres surrounding the mansion, will be converted into building sites.

New shops have just been built on the west side of Briggate, Leeds, from designs by Mr. E. J. Dodgshun, of that city. The buildings are three stories in height, and Elizabethan in style, the facades above the shop level being of stone and terra-cotta.

THE Board of Works has obtained possession of nearly all the property adjoining Westminster Abbey on the site desired by Mr. Shaw-Lefevre for a mortuary annexe to the cathedral. There remain two houses, one with a lease of twelve months to run, the other still for ten years in the occupation of the tenant. The work of demolition will shortly commence.

ST. PETER'S, EATON SQUARE, AND SIR ARTHUR BLOMFIELD, A.R.A.

IN the descriptive sketch of Sir Arthur Blomfield's career, in our first issue, we specially remarked upon his enlargement and adornment of St. Peter's, which we characterised, and which we are happy to characterise again, as a splendid piece of work. There are those, however, who differ with us, and one of our correspondents addressed to us a criticism which was so trenchant that—although from the nature of the communication we are compelled to withhold the writer's name—we felt compelled to put it into type, and to invite Sir Arthur Blomfield to reply to it, not in the nature of an anonymous criticism, which of course it was not, but by way of explaining away a contention which is not peculiar to the gentleman who addressed us. The criticism which we forwarded to Sir Arthur Blomfield was the following:—

"SIR A. BLOMFIELD has done, no doubt, and is doing, very fine work. But surely his work at St. Peter's, Eaton Square, is to be blamed rather than praised. I mean that to praise the inferior work of an able man does so much harm. Sir A. W. Blomfield's treatment of St. Peter's seems to me a mistake from the beginning. A fine Classic portico—and the style all through of the original church utterly opposed in feeling to Gothic—it was a great mistake, and a failure, to graft on it any sort of type of Gothic. Money there was without stint. There was a fine opportunity to show how a great Classic temple might be a Christian church. There is no dignity, and little, if any, artistic effect in what Sir Arthur has done here. Any inspection of the church, inside or out—especially inside—makes me sorry. The re-casting Architect has missed his way, and has missed his chance. My own feelings—with all my admiration for Sir A. W. Blomfield's successful work—is that St. Peter's, Eaton Square, only brings him disgrace. In the interests of Art, the recasting of St. Peter's should have been condemned."

And this is Sir Arthur Blomfield's vindication of his work:—

To the Editor of "THE BUILDERS' JOURNAL."

February 21st, 1895.

DEAR SIR,—I am much obliged to you for so courteously letting me see the anonymous criticism which you sent me on my work at St. Peter's, Eaton Square. So far as the writer bases his remarks on questions of taste and architectural propriety there is nothing to be said; arguments on such matters are notoriously useless. My comfort must be that, if there are many people who condemn my work, there are plenty of others, including (I am glad to know) many entitled to speak with authority on questions of Art, who take a diametrically opposite view. It is also gratifying to me to know that some years' later my friend, Mr. G. E. Street, treated the Guards' Chapel, in Birdcage Walk, in precisely the same spirit, though I need hardly say with far greater skill and knowledge than I could pretend to, and (I may add), with far larger means than I had for a much larger work.

When, however, the writer comes to

matters of fact, it is evident that either his memory is defective or he never saw the interior of the church before the alterations. It was simply a vast square room, with galleries (which had to be preserved), round three sides, and a shallow rectangular recess for the altar on the fourth. There was nothing to suggest style or treatment, except the round-headed windows, which I ventured to think entirely out of character with the architecture of the portico.

My work was not done at hap-hazard, or without long and anxious thought and much consultation with those who had the best interests of the church at heart, and now, after the lapse of more than twenty years, I see nothing in the general scheme that my

ST. BARTHOLOMEW THE GREAT—NEW NORTH TRANSEPT.

maturer judgment condemns or that I could wish to see altered. If that avowal brings me "disgrace" I must try to bear it in public with that equanimity which the writer of the criticism no doubt feels in pronouncing judgment anonymously.

Faithfully yours,

ARTHUR W. BLOMFIELD.

[In a private letter to us Sir Arthur says that in matters of taste "disgrace" is rather too strong a word to use, and most undoubtedly it is. And it is also a very foolish word to use.—ED.]

SAWDUST.

WITH a view to consider the position as to the question of the northern approach to the Tower Bridge, the Whitechapel Board of Works is convening a conference of the neighbouring local authorities.

THE Nottingham Town Council have decided to purchase 19 acres of land as a recreation ground for the Meadows district, to replace the Queen's Walk Ground taken for the purposes of the new M. S. and L. Railway. The land forms part of the Clifton estate, and its cost is estimated at £18,000, with another £2,000 required for levelling and laying out.

THE Salford Corporation has decided to apply to the Local Government Board for sanction to borrow £7,000 to complete the purchase of the remaining properties under the housing of the working class scheme. There are borrowing powers to the extent of £63,373, of which £14,000 is still unexpended.

THE restoration of the parish church of St. Mary, Shrewsbury, the nave of which was partially destroyed during a gale on Feb. 10th, 1894, when the upper portion of the slender spire was blown down, is making good progress. The spire has been restored, and the contractors, Messrs. W. Bowdler & Co., of Shrewsbury, have rebuilt the walls of the clerestory with new windows, and have finished the reconstruction of the roof, which is an exact counterpart of the old one, and, indeed, made up in great part of the old timbers. The lead covering is completed, and in the inside the scaffolding has been removed. The workmen are now engaged clearing out the debris and rubbish that had accumulated. The church will be reopened at Easter, the only part of the interior remaining to be dealt with being the floor and the seating.

MR. W. DURRANT has been appointed surveyor to the Chertsey Rural District Council at a salary of £200 per annum.

THE Doncaster Corporation has accepted the tender of Messrs. Arnold & Sons, at £505, for the new telegraph offices at the race common.

MESSRS. W. S. HALE and J. C. MURRAY have been elected associates of the Royal Society of Painter-Etchers.

THE Halifax Town Council has under consideration the purchase of the old infirmary and Assembly Rooms, in Harrison Road, for new police offices and cells. The price for land and buildings as they stand, the whole comprising an area of 4,250 square yards, is £7,000. If the purchase is ratified by the Corporation, an outlay of from £15,000 to £20,000 will be entailed in the demolition of a large part of the present premises and their reconstruction to suit the requirements. The additional provision of a court and magistrates' and clerks' offices will also probably be made.

THE Bath Town Council have resolved that in future all plans and elevations of new buildings submitted to the Corporate Property Committee for their approval shall show in outline the elevations of the buildings on each side, the frontage line of the adjoining property, with all projections beyond that line, and the nature and description of the materials of which the building or buildings are proposed to be constructed.

THE Town Council of Harrogate has resolved that a portion of the Stray, known as Prospect Hill, should be laid out in accordance with the plans presented by the surveyor at a cost of £1,530, the large scheme, costing £3,500 not being approved.

ANNOUNCEMENTS.

Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

THE EDITOR does not hold himself responsible for the opinions of Correspondents, whose communications should be brief and plainly written on one side of the paper.

THE BUILDERS' JOURNAL goes to press on Monday at 6 p.m. All matter must reach the Editor by the first post on Friday morning to ensure its treatment in the current issue.

Publishing.

The terms for free post Subscription to any part of the United Kingdom is SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments. Subscribers in London or the Suburbs receive their copies by the first post delivery on the day of publication.

Advertising.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS WANTED.

Per line (about 10 words), Sixpence.

Minimum charge, Eighteenpence.

Three Insertions for the price of Two.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE AND GENERAL ADVERTISEMENTS.

Four lines (about 40 words), Three Shillings.

Each additional line, Sixpence.

Prepayment in the above Advertisements is absolutely necessary.

The charge for Paragraph Advertisements on the Front Page is Fifteen Shillings an inch, single-column. Minimum charge, Five Shillings. Paragraph Advertisements on ordinary page, single column, Seven Shillings and Sixpence per inch.

MANUFACTURERS' ANNOUNCEMENTS ON ORDINARY PAGES.

Per Page, Single Insertion, Eight Guineas.

Discounts for series on application to the Manager, who will make Special Contracts for Announcements on Back and Leader Pages and positions facing matter.

NOTICE.—Advertisements for current week's issue are received up to last post on Saturday. Alterations in standing Advertisements must be made before 6 p.m. on Fridays.

Advertisers in THE BUILDERS' JOURNAL may have their replies addressed to the Manager's Office, free of charge, and may have them forwarded if addressed envelopes sufficiently stamped are sent.

Reading Cases, lettered in gold, may be had from the Manager. Price, One Shilling.

Talbot House, Arundel Street,
Strand, W.C.

At a meeting of the Harwich School Board on Thursday, Mr. J. Start, F.S.I., architect, of Colchester, Clacton-on-Sea and Harwich, was instructed to prepare plans of schools for 450 children on the main road and for 350 children on the Bathside, both to be built on the ground floor, with covered playgrounds, lavatories, &c., in the basement. The sites for these schools have very bad bottoms, and will therefore necessitate piling and planking. The clerk was also instructed to advertise for tenders for the Lower Dovercourt schools according to plans prepared by the same architect.

The Builders' Journal.

MEN WHO BUILD.

No. 3.

MR. ASTON WEBB.

LONG years ago, in memory's fancy calendar, the exciting moments of your life when first your name, with half the alphabet after it, appeared upon a real brass plate on a real front door, are vivid yet. And what hopes and aspirations crowded the back room on the second floor, and how beautiful was the conception of the colleges you were going to study, just to get your hand in, for the works which were going to crowd upon you almost before you had time to pin your Whatman to your Stanley drawing board. Those things have passed, the aspirations and the conceptions—but standing in Mr. Aston Webb's fine room in Queen Anne's Gate, turning over the portfolios of drawings for Christ's Hospital Buildings at Horsham, it wanted an effort to realise that this was not some other man conceiving a fairy structure, beautiful in parts and grand in whole, which, like the structures of the kingdom of Hope, fade away the moment you come to love and to admire them. It was no such dream, but the beauty of a reality which comes to one man in a century, and, perhaps, when he least expects it.

Mr. Aston Webb is just entering that expansive period known as the prime of life, and, therefore, it is not difficult for him to remember the five years he spent as an aspiring pupil with Messrs. Banks & Barry, five years of almost incessant classic work, bringing its usual reversal of feeling the moment the five years' toil was ended. For twelve months Mr. Webb travelled through Europe, doing the usual places, making the usual sketches, saturating his brain with the usual studies. In 1873, on his return, he was the Pugin student; for the next nine years nothing disturbed the usual tenor of his way towards the Presidency of the Architectural Association—which always seems the first official stepping stone in the career of an eminent member of the profession—in 1882. The world, about this time, became thoroughly acquainted with the work of the coming man. His mind had already matured upon a method which had charm and subtlety and piquancy of effect without the laborious feeling which characterises the work of "picturesque" designers. His work was minute—it is minute to this day—in general handling, there is nothing broad and fierce about it, it is insinuating rather than striking, and the more one looks at a specimen of it the more this fact develops itself. Perhaps it was from his father—a not altogether unknown painter and engraver—that this faculty sprung. In 1889, Aston Webb became honorary secretary of the R.I.B.A., a post where much tact and busi-

ness delicacy is necessary, and he retained the position until 1892. Two years' later he became Vice-President. The first great fortune, however, that came to him was the day on which the designs he had prepared for the Admiralty and War Offices, in conjunction with that supremely clever draughtsman Mr. Ingress Bell, were selected as entitling the authors to enter the final competition. That in that final competition the work of these two men warranted the intense praise of many able critics is common knowledge, and that the execution of their matured designs would have added a noble monument to the public buildings of Europe is an acknowledged fact. The good fortune that came to Messrs. Webb and Bell over this work cemented their collaboration, and since then, most of the public work entered upon has been in conjunction with each other. The Victoria Courts, at Birmingham, gained in open competition was a very fine work, so fine, indeed, that when the new Police Offices were to be erected on an adjoining site, it was the architects of Birmingham who, in a body, petitioned the authorities to commission Messrs. Aston Webb and Ingress Bell to carry out the work. Upon this, other honours

came thick and fast. The Government, having been strained into action for the completion of South Kensington Museum, invited Mr. Webb and two other architects to prepare designs, and Mr. Waterhouse, the assessor, selected the work of Mr. Webb as the most satisfactory of the three. Over the fireplace in his room in Queen Anne's Gate, the perspective of this fine work rests peacefully behind its guardian glass, smilingly waiting the advent of a Chancellor of the Exchequer who has a heart above estimates and the imperious demands of a devastating army and navy. The work itself has quite an Eastern flavour about it, stimulated by the nature of the exhibits it will house, and is the most ambitious design Mr. Webb has personally conceived; and perhaps the finest praise you can offer to it—in its present paper condition—is that in execution it will rival very closely that magnificent pile, the Natural History Museum, which Mr. Waterhouse himself gave us on the other side of the road.

The Metropolitan Assurance Offices, in

PEVEREY.—ASTON WEBB, ARCHITECT.

Moorgate Street—the entrance of which is illustrated in the present issue—was carried out by Mr. Webb and Mr. Bell, as was also the United Service Institution, in Whitehall. But, above and beyond all else must be put the magnificent scheme which these two men offered successfully in competition for the new schools of Christ Hospital, at Horsham, a scheme you will have delight in fully describing when the drawings are amended from their competitive state. Of domestic work, Mr. Aston Webb has done much and done it beautifully. His largest house is Peverey, the delightful seat of Sir Offley Wakeman, a man of much artistic taste and refinement; and everybody knows of the restoration work at St. Bartholomew's Church, which is still leisurely proceeding; and of the new Church of the French Protestants, in Soho Square. St. George's, at Worcester, is now in course of erection; and Mr. Webb has large works maturing towards completion in Stafford, Liverpool, Burton, Monmouthshire and Sussex.

For at least 20 years, Aston Webb has devoted a great deal of his time to the two professional societies, and perhaps it is to his belief and hard work in the Architectural Association that much of his success is due. He has, more than any other man, got nearer to a matured nineteenth century style, and a

very charming style it is. Like most modern English work, it has the Renaissance as its starting point, impressed with the same influences which have created an Ernest George and a Norman Shaw, and although, as yet, Aston Webb has not quite arrived at the perfection of these two wonderful artists, he has undoubtedly surpassed them in the wider range of method which he is able to adopt. No more striking instance of this will be found than in the Horsham Schools, and the completion of the South Kensington Museum, which is entirely his own and quite a revelation. Some there are who consider Mr. Belcher's design for this latter scheme the most wonderful piece of architec

years much undoubtedly will happen in the camps of architecture; and it will surprise no one to hear that Aston Webb, one of these fine mornings, will find himself wending his way towards a certain spot in Piccadilly, where we are taught to believe—and where we do believe—rests all that is most beautiful and most refined in English Art.

FLUATE is the name applied to a liquid used for hardening and weatherproofing building stones and similar materials, chalky and not chalky. Crystals of fluate of magnesia are dissolved in water, and a brush is used to apply it. The cost for dressing Bath or Portland stone is stated by the Bath Stone Firms, Limited, Abbey Yard, Bath, to be 1d. for each square foot.

THE Wakefield City Council has decided to engage Mr. R. Hammond as electrical engineer, and to apply for powers to expend £20,000 in carrying out the first instalment of the proposed electric lighting works for the city.

THE Aberdeen Harbour Commissioners have resolved to provide additional shed accommodation on both sides of the docks, and a new steel swing-bridge, with double line of rails, to take the place of Regent Bridge, which at present crosses the east end of the upper dock. The work will be carried out by instalments. The estimated cost of the new sheds is upwards of £33,000, and that of the bridge £13,400.

PEVEREY.—ASTON WEBB, ARCHITECT.

tural skill of the last quarter of a century, but with that we have at this moment nothing to do.

Although Aston Webb lives in Ladbroke Square, in a house he has altered to his own liking, his practice takes him a deal into the country, and that to him is a delight. Above the medium height, slim of construction, and not particularly robust in appearance, Aston Webb possesses a fiendish love of work which he has the faculty of impressing upon those about him. No man takes greater pains than he does, no man insists more implacably upon his desires, no man possesses the power of conception more forcibly than he possesses it. In the next ten

A CHAT WITH THE PRESIDENT OF THE ARCHITECTURAL ASSOCIATION.

THERE is one very noticeable feature of the Presidency of the Architectural Association—it seems to confer upon its upholder a sweet and happy disposition, like unto that of the man who spends his day amid the green fields of an earthly paradise, and his night coquetting with the fairies of an architectural heaven. Just cast your memory back over the presidential list for five, or ten, or fifteen years, and you will call to mind as fine and jolly a set of earnest men as ever yolked themselves to a position which is one unending spell of good, sound, honest hardwork, from the moment they are elected until they assist their successor to mount the presidential dais in Conduit Street. You must not play pranks with any of the executive fellows of the A.A., there is a round dozen who can use their fists as well as their pencils, and they are all at fighting weight in case any luckless individual should fall foul of their good intentions. They keep a journal too, do these enterprising young men, and they have been known to say some very nasty truths before now in the columns of the A.A. Notes.

THE BUILDERS' JOURNAL—in the specimen number issued for commercial purposes in December last—contained a pertinent criticism on the inaugural address of the President of the Architectural Association. It was not considered that Mr. Mountford had done justice to his opportunity, and we said so plainly, frankly, and without fear. With men like E. W. Mountford—there is nothing of the insipient, long-locked, sallow cheeked pessimist about the President—a criticism is always safe, because they know the world, and can take a ficer with the same equanimity as they can give one. Nothing came of our criticism—except a half-hearted protest on one point from a very prominent Committeeman of the Association—until the other day when Mr. Mountford himself inquired why it was “not wise to invest the transactions of the Association with too much importance.” When this thunderbolt dropped upon the editorial table in Talbot House, there was a bit of a consternation. Visions of more Chancery Orders took our breath away, and before we regained it, we thought we heard the tramp of the twelve light-weights coming down the corridor. As at present we only muster nine men and a boy, and the Editor himself—owing to events which need not be mentioned—is suffering from a serious attack of nervous debility, we could have offered but a poor resistance to overwhelming numbers, and, so, whilst everybody barricaded themselves in their rooms, one of the number ventured out to discover the President of the Association himself, and to appease him, before he commenced to do any damage.

A happy man, with a genial smile, is Mr. E. W. Mountford, and for the second year he is filling the presidential chair of the Association. Whenever you come across a man who has served a second year in this position, put him down as a brick of the right sort, and fear not for your wisdom.

“Well, Mr. Mountford, you think the doings of your society merit the utmost consideration?”

“I do, most emphatically. They merit the utmost consideration and the utmost importance. Why, the Association has more influence for good or evil upon the architecture of the day than the Institute itself.” And here you thought the first personal attack was about to be made upon you, for the President looked so very serious. “The flower of the profession are members of the A.A. We are helped by eminent men who have never entered the Institute—more's the pity

—and nearly all the prominent members of the Institute have passed through our ranks.”

“Is there any objection,” I humbly asked with more visions of Chancery Orders, “is there any objection to my mentioning that fact?”

“None in the least; we make the architects, the Institute only examines them.”

“Then you are what we ourselves have termed you—The English School of Architecture?”

“Decidedly we are. Our regular course of tuition extends over four years, and if a youngster enters at the beginning and goes regularly through the whole period, he will have the best tuition in his art it is possible for a man to get in England. Of course, we are dreadfully hampered by want of funds and more spacious and convenient premises.”

Our chat then got a little looser—not, of course, in its moral tendency, but in its application to the A.A. Mr. Mountford expressed, delightedly, how the great rush into the profession had stopped, and he instanced it by remarking that at the beginning of the session there were only five Architectural students in the Royal Academy. And the stop could be traced in the working classes of the Association itself. But Mr. Mountford was emphatic in his denunciation

MR. E. W. MOUNTFORD.

of the so-called architectural classes which were held at Institutions like the Polytechnic in Regent Street. So long as they aimed at merely adding general knowledge and appreciation of the subjects treated there could be little harm, but when dozens of youngsters went through the curriculum, and launched themselves into the world as full blown and competent practitioners, then an incalculable amount of injury was caused. Of other men and other matters the discussion became general, and it was not the least pleasant when Mr. Mountford expressed the highest possible opinion of “THE BUILDER'S JOURNAL,” an opinion which he assured me was shared by all his professional friends.

So pleasant had been our chat that a whole hour had slipped by before we had half exhausted the stock of debatable subjects, although it was Saturday afternoon and the small army of draughtsmen had departed for the day; and deeming it wise to cut off all detail here and save it for a special descriptive sketch of the history of the Architectural Association and some of its Presidents, with which Mr. Mountford courteously promised to render what assistance he could, I left, for the moment, one of the most genial

men ever enrolled upon the presidency of the A.A.

At the top of Buckingham Street, in the Vegetarian Restaurant, much affected by architectural underlings of the Adelphi, I got through, from the public call-room, to our own telephone—our number, if you will remember, is 35422—and joyously imparted intelligence to the imprisoned staff that the dogs of war had been called off. “No Chancery Orders?” plaintively queried the editor, and when I assured him there were none I thought I heard a sigh of relief just before the keys clicked in the locks, the doors of the publishing office were again thrown open, and everybody resumed the even tenor of his way.

AN ANCIENT DECORATIVE INDUSTRY.

IN a Foreign Office Report which has just been issued some very interesting particulars are given of a very ancient Art industry, which is still carried on some 32 miles south-east of Pisa, viz., the alabaster industry. Vice-Consul Carmichael, of Ceylon, to whom we are indebted for the interesting report from which we extract the particulars condensed below, says that Volterra, where the alabaster is found, enjoys a very special distinction in the world among places which produce the commodity, which is of five main varieties, and is found in nodules, embedded in large masses of limestone. At the end of each cavern whence it is extracted two or three men are to be seen working with small T-shaped picks, by the none too brilliant light of oil lamps, which, by a singular clinging to ancient traditions, are still of Etruscan shapes. In one cavern the block of alabaster will be well seen projecting from its surrounding bed of limestone, the operators carefully feeling all round it in order to avoid damaging it, and in order to get it out whole, the specimen being the more valuable the larger it is. In another cavern the workmen are heartily beating down the imprisoning wall of limestone till the white nose shows of what proves to be a block, blasting being resorted to when the quantity of limestone is very heavy, the workers preferring to work carefully by means of their T-shaped picks. This industry dates back to classic times, but great changes have been effected in it in even modern days. In former times there were three distinct classes of workmen employed in fashioning the raw alabaster—the master-artist, who owned a work-shop and employed hands, selling his products direct to the shops; the journeyman, and the travellers, who took the cases of goods and sold them as they went in all countries of the world. Of these the first and the last are extinct. In these times three men, usually relatives, work together, one being a turner, another a modeller, and the third a decorator, who is responsible for the carving of such decorative embellishments as fruit and flowers. Their gains are very small, and travellers, owing to the lowness of the prices at which they are sold at Leghorn, frequently refuse to believe that they are fashioned by hand labour alone. One description of alabaster is made by a process of dyeing—still kept a trade secret—into a good imitation of coral, and for a long time this speciality had a good sale. The fault of the alabaster workers is that, although they have all the true artistic characteristics of the inborn decorative artist, they neglect the fine models which are to be found scattered throughout the churches of Italy, evidently thinking that a superior class of work would not sell. Hence the market is drenched with dancing girls, classic maidens, and such like stock subjects, whereas a change would be more than passing welcome.

ST. BARTHOLOMEW THE GREAT—NEW NORTH TRANSEPT.

JEAN FRANCOIS MILLET.

The Peasant Painter of Barbizon.

By ARTHUR O'NEILL.

Continued from page 30.

CIRCUMSTANCES were more favourable for Millet at the date on which I met him, though even then he was troubled with his own ailments, his constant headaches and waning powers of sight; with the dangerous illness of his devoted peasant wife; with the draft upon his exchequer made by his brothers, who appeared to think that because he could paint well he must necessarily be paid well. But the state of his affairs during the preceding twenty years, which includes the period of his best work, was simply agonising. Tennyson tells you that it is the eternal want of peace that vexes public men. This master of Landscape Art was sorely straightened in his means from the first day that he took up Art as a profession, to earn his living, as he remarked, "by the sweat of his brow." Alfred Sensier was to him what Dr. Johnson was to Oliver Goldsmith. He managed, but with difficulty, to get an occasional £40 for pictures which now sell, or would sell if they were in the market, for £4,000. It may be taken as a maxim, though I myself should be saddled with the responsibility of originating it, that the course of genius will not run in the same groove as the ways of a prudent housewife. From the earliest days of his abode in Barbizon, Millet, like Rousseau, had around him a group of creditors whom he had, by hook or by crook, to appease.

Let Sensier, his always loyal supporter, describe the situation—"A baker, the only one in the place, threatened with oaths to withdraw the daily bread. A grocer had become his bailiff. A tailor sent the sheriff's officer to sell the furniture of his (Millet's) studio, and he would not allow the artist a day's or even an hour's grace." There is some reference in our proverbial philosophy to the toad under the harrow. Millet's time, when he produced "The Angelus" and the first of the "Sheep Shearers" series, was that of dire extremity, and it would be hardly an exaggeration to say of sheer destitution. "Try, my dear Sensier," he writes in 1853, "to coin some money with my pictures; sell them at any price; but send me a hundred francs, fifty, or even thirty." No doubt Sensier, the loyal, met the urgent demand. All we know of it is his own comment. "Then," says the true friend, "I trotted all over Paris, offering dealers and amateurs the paintings of my friend. Some grinned and sent me off as a madman; others, more rarely, bought, but at laughable prices. I went to my comrades. I told them they could buy with confidence, and that I would take the picture back if, later, they came to the conclusion that they had made a bad bargain. In this way I made some sales, and, after a month or two, back would come the painting, with a 'Decidedly, I don't care for this artist; I like anything else better'—a new embarrassment for me. I honoured my promises, but only by superhuman efforts, loans, combinations, all the series of youthful difficulties. "Thus," says Sensier, "I acquired many pictures of Millet, in spite of myself, as it were, and by the mere force of circumstances. Later, some of these stubborn amateurs came to me for the same pictures, but I refused, saying: 'It is too late; your pictures are in my harem, and I will just let you see them, like Candaules and the Gyges. But the mould is not broken. Go to Millet; he will serve you.' That was a time of trials, struggles and humiliating picturesque inventions to get us out of difficulties. I see it all through a mist, which changes sometimes into splendid rainbows; for I was as convinced as of a mathematical fact that Millet was a great painter."

This somewhat of a hackneyed phrase, that of the "good man struggling with adversity," is it possible that the gods did not love Millet in proportion to the gifts with which they endowed him, or even in the ratio of the vexations which the powers of evil brought to perplex his stalwart brain and honest heart. Three years passed and Millet, in the depths of the forest, had heard the echoes of his fame in the Salon, and had read the glowing eulogy of his "Sower," as presented by that most shrewd of critics, Theophile Gautier.

But fame by itself does not fill the bread-basket and thus the artist writes to Sensier on New Year's Day in 1856:—

"Barbizon, January 1st, 1856.
"My Dear Sensier,—The hour of breaking-down has come, decidedly. I have just found a summons to pay within twenty-four hours to M. X., tailor, the sum of 607 fr. 60 c. (say about £24). He is a vampire, as he promised to take a note till March. On the other hand, G. refused bread and was disgustingly rude. It has come! A whole procession of creditors will file through the house; it will be very lively.

"I have just seen the bailiff, and told him in my ignorance that credit was a usual and well-known thing. Does not the law allow an arrangement? A tradesman can catch you in a trap by offering you a year's credit, and at the end of six months bring you a bill, and force you to pay! Yes, the law knows nothing of these things—you must pay! It explains to me my want of aptitude at business, for, as far as I can see, you must put aside all clear reasoning and all good sense to learn chicanery, which is nothing better than subtle cheating. Since the law has a right to collar me, pray tell me what they will do to me, for I cannot admit its right to violence except on refusal of payment. I thought it was the business of the law to court conciliation. Tell me, for I have a hard head, how far people can go who want to proceed to the uttermost, and whose conscience never troubles them, for you might revolt against what is legal and say—'That is wrong—odious.' I want you to tell me just what they can do.

"Rousseau, to whom I told the story of the bailiff, is furious."

* * * * *

Here is another fragment from his written regrets:—

"Ah! the end of the month—where shall I find the money for it? for the children must eat."

"My heart is all black."

"If you knew how dark the future, even the near future, looks! At least, let me work to the end."

"I have a series of headaches which interrupt my work very often."

* * * * *

Or again, in his letter to Rousseau:—

"How I bore you, my poor Rousseau! You are a good proof that those whose hearts are kind live the life of victims. Do not think that I am unmindful of all the trouble that I put you to, but I can't help bothering you. I seem to be under a sort of spell. Ah! I must stop. I cannot and I dare not say what I think on this subject."

"I am working like a slave to get my picture done ('The Gleaners'). I am sure I don't know what will come of all the pains that I give myself. Some days I think this wretched picture has no sense. At any rate, I must have a month of quiet work on it. If only it is not too disgraceful! Headaches, big and little, have besieged me this month to such an extent that I have had scarcely a quarter of an hour of my painting time. Physically and morally I am going down hill. You are right. Life is a sad thing, and few spots in it are places of refuge. We come to understand those who sighed for a place of refreshment, of light and of peace. One understands what Dante makes some of his persons say, speaking of the time that they passed on earth—'the time of my debt.' Well, let us hold out as long as we can."

Is it wonderful, or in any way astonishing, that this "bright particular star" in the constellation of French landscape artists played for a time with the thought of self-extinction? He abhorred the art; but the suggestion pressed truly on him again and again, and found a permanent expression in several sketches, one of which I saw in the portfolios of an American collector—a painter lying dead at the foot of his easel; a woman, seeing the dreadful sight, lifting her arm, and appearing to cry aloud to the world for succour, as grim and horrible a conception as anything to be found in the Wiertz Museum at Brussels. And yet again, anent his troubles. His embarrassments increased in volume and multitude. The distracted artist surmounted in his mind, and through his wonderful prescience, the difficul-

ties of his domestic troubles and commercial cares, and, defiant of these small worries, soared with his own sweet spirit and on his own fleet wings into the broad empyrean—the realm of bliss, where everything is as lovely as the eyes are which search for loveliness.

(To be concluded.)

EXCAVATIONS AT MEDIUM.

AMONG the many valuable explorations which have been conducted by Professor Petrie, one of the most interesting is undoubtedly the excavations which were carried on at and round about the Pyramid of Medium. This Pyramid is of rather a peculiar construction, and quite unlike any of the other pyramids of Egypt. The system employed in constructing these pyramids was very similar to that of the so-called mastabas. They are for the most part rectangular masses of bricks, and faced with mud and earth. The pyramid of Medium has suffered many changes. As early as the time of Rameses II., B.C. 1333, the outside casing had been taken off, and little by little it was denuded of its former facings. A small temple was found in the east side of the pyramid. It consists of a small passage, a chamber, and a courtyard. Two steles, or tablets, were discovered between which was an altar, having, however, neither sculpture nor inscription. In the tombs were some very remarkable mummies. Unlike the usual method of burial among the Egyptians, by placing the mummy on its back at full length, the mummies at Medium were found in all sorts of different positions. Most of those found were doubled up with their knees under their chins, after the manner of Mexican mummies. Only one out of thirteen mummies was found in the usual extended position. Most of the mummies had their arms in front, but more often they were discovered with their hands holding their legs, a position which again reminds us of the Mexican method. The most beautiful tomb discovered is the tomb of Ra-hetep, who calls himself a prince. This tomb has been very much mutilated, and a large quantity of the colouring has been washed off by persons taking wet impressions in a careless manner. Among the many interesting representations with which this ancient piece of architecture furnishes us is one which shows Ra-hetep and his wife Nefert watching some hunting which is going on in the desert beyond. Opposite to this we have another scene representing Ra-hetep watching his sons catching birds; below this we see fishermen coming to shore with their nets. The whole of Ra-hetep's tomb is, in fact, one huge picture gallery, too large to be described in a few words. Important additions to our knowledge of hieroglyphics have also been made by these excavations, for the inscriptions are so beautifully cut that we can actually see the kind and species of animal represented. Thus, for instance, the owl, which is so common in hieroglyphic inscriptions, is shown by its colouring not to be the common bird usually found on barn doors, but the white-faced owl only seen in zoological collections. Prof. Petrie is still in Egypt, and doubtless he will, on his return, bring fresh treasure from the land of the Pharaohs.

We regret to announce the death of Mr. Francis Vigers, founder of the well-known firm of surveyors, Messrs. F. Vigers & Co. The sad event occurred on Thursday at his residence at Hersham, Surrey. The deceased gentleman, who for many years acted for the London School Board on most of its arbitration cases, was of the advanced age of seventy-five, and had retired for some years from active interest in the business. On Tuesday the funeral took place at Hersham cemetery, in the presence of many members of the profession in which the deceased was so greatly respected.

WINCHESTER.

AMID the scented clover, on the summit of St. Giles' Hill, and gazing upward into the blue vault, lined and flawed with wisps of high cirrus cloud, we forgot that less than two hours' ago we were in the close atmosphere of the terminus at Waterloo. Below, in a fold of the swelling Hampshire Downs, lay Winchester, and to the south the huge shoulder of St. Catherine's Hill, still fretted and scored with the works of the fortified camp of Vespasian, who conquered the city from the Belgæ—whence its Roman name, Venta Belgarum—for Winchester was a city ere the Romans took it, and Caer Gwent, as the Armorican settlers called it, was wrested from these by the Belgæ, who, in their turn, succumbed to Roman arms. Ludor Rous Hudibrass founded it, says tradition, in 892 B.C., which date would corres-

As there is a river at Macedon and a river in Monmouth, so is there a river at Damascus and a river at Winchester; but the resemblance does not, as in the former instance, end only there. Perchance some who read these lines will testify to the fact that the Baroda, at Damascus, and the Itchen, at Winchester, both split up into numerous streams, permeate the numerous cities, and turn up in the most delightful way when least expected. Both streams are shallow and of crystalline limpidity, and in both are trout, head up stream, lazily waving their fins. Leaving Bridge Street, and following a foot-path called The Weirs, we come—between stream and cottage gardens, bursting with a wealth of old-fashioned posies—to a wonderful wall, belonging to Wolvesey Castle, once the palace of the Bishops of Winchester. What a wall! Cold flint contrasts with mellow red brick, and the top is

Leaving the portal, we turn to the left, and then to the right, by the two noble elms, across the rich water meadows towards St. Cross. On the right are the College "Meads," bright emerald under the glorious sun, and we recall the lines—

Ridet annus, prata rident
Nosque ride amus,

sung by generations of Wykehamists in their famous home-going song, "Dulce Domum." We did not essay the experiment; but to this day, they tell us, all who knock at the buttery wicket of St. Cross are regaled with a horn of ale and a slice of bread. The quietude of the quadrangle and the quaintness of the ambulatory carried us back from London and 1891 to Henry de Blois and 1132, the date of men "to be lodged, clothed, fed, and properly cared for," and of a hundred other poor men "to be received and fed daily at the hour of dinner." Just a peep at

WINCHESTER CATHEDRAL.

pond with the year 139 before the founding of Rome. Dismissing this to the regions of fables such as that which tells of Brutus, grandson of Pious Æneas, as the founder of a colony in Britain, we must still feel the imposing weight of antiquity when we look upon the place which was England's capital, when London was an obscure settlement in a marsh. But the real Winchester, dear to the hearts of Englishmen, is neither Caer Gwent nor Venta, but the city which is represented by the square Norman tower and the ridge of mighty nave which rise above bread masses of foliage and are scaled by the graceful tower and turrets of Wykeham's College to the south.

The shining reaches of the Itchen, the dark masses of verdure, tempt us down to Winton, and we descend, by winding paths, to Giles' Hill, and emerge in Bridge Street, where a peninsula covered with flowers juts into a mill-stream.

garnished with yellow stonecrop and grey and golden lichen. But this can only be seen at intervals, for the wall is tapestried with fruit trees—peach and apricot, and fig trees of a growth so luxuriant as to remind one once more of Damascus. We pass along the banks of Warden's Stream to the College, and, as we revel in the beautiful fourteenth century architecture and the old-world repose of the place, we fervently thank that officer of Cromwell's who, being an old Wykehamist, dissuaded the stern Puritan from destroying the College.

A glance at the courts and through Seventh Chamber Passage, at the new buildings and "Sicily," and we leave, giving one look back at the three niches—one containing the image of the Virgin, holding a book; another that of the Archangel Gabriel, with a scroll, on which are the words "ave gratia plena;" and a third, the figure of the founder, vested and mitred, in the attitude of invoking his patroness.

the Church, dear to students of architecture as an example of the transition from Norman to Early English, and we leave the quiet world of the "Brethren," who clad in their sable gowns, bearing on the left breast a silver cross, potent, seem, like the venerable roof beneath which they dwell, to be mellowed by age. By Beaufort's Tower, where, in a tabernacled niche, kneels the carved presentment of that Cardinal, who, by genius and inclination, was rather a soldier and a statesman than a priest, we pass under the groined vault of the gateway, with Sherburne's motto graven in the wall, "*Dilexi Sapientium*," and stand once more in the lush grass of the meadows, gazing eastward at St. Catherine's Hill, crowned with, perhaps, the noblest clump of firs in England. Again skirting the classic demesne of St. Mary College, Winton, we wonder if the Flamens of the Temples of Apollo and Concordia, once standing hereabouts, taught gentle arts

to rude British youth, and, if so, whether the antique rules were as stringent as those embodied in the well-known motto "*Disce aut Discede*," &c., which adorns the walls of the present house of learning, and has been freely translated "Work, walk, or be whopped."

Passing the barracks, the dark uniforms of riflemen remind us that Winchester, once a camp of Roman legionaries, is now the depôt of those *corps d'élite* of British infantry, the Rifle Brigade and the old "Sixtieth." Leaving the battlemented West Gate on the left, we go down High Street, by the Cross and the old-fashioned Pent House, resembling in quaint simplicity the Pinz Zas in the Vin del Borgo at Pisa, to the Abbey Gardens, free to all, daintily kept, and with one of the several streams of limpid Itchen flowing through them. Recalling dim memories of St. Grimbald and clearer ones of Alfreht, its founder, we have the site of the Newen Mynster. Most probably on this spot the Codex Wintonensis was drawn up, and England first divided into counties. We reach the great church, which is the city's chief glory, through the tortuous passage of the Slype, which debouches at the north-west angle of the nave, on one of the buttresses of which is carved a Latin rebus, meaning "That way for him who prays, and this way for him who journeys."

The avenue of limes leading to the western door of Winchester Cathedral rivals the famous walk in Trinity Gardens, Cambridge. They are now laden with a wealth of sweet-smelling yellow-green flowers, and the myriad translucent leaves which diaper the sky, form a fitting approach to Wykeham's glorious pile. By the way, who ever thinks of Winford, Wykeham's almost forgotten architect, when descending on the excellence of the noble fane? Bishop Edlington's great west window, Walklyn's Norman tower and massive transepts, and Bishop Fox's Lady chapel at the eastern end, with its delicate tracery terminating in the finial and the statue of Fox himself, with his emblem the pelican, combine with Wykeham's great nave to make a goodly temple. But it is in the associations, more than in the venerable stones, that Winchester impresses us.

The dim mist of antiquity shrouds the beginnings of Christianity at Winchester. Under Vortigern and Uther Pendragon, the Cathedral existed. Its worshippers suffered under the persecutions of Diocletian, and rejoiced at the advent of Constantine, in whose son, Constans, the Priory adjoining found a devoted monk. With Cedric, King of the West Saxons, the fane was giving up to the worship of Thor and Woden, but with Kynegils it was restored to the Cross. Venta had become Wintonceaster, and the capital of Wessex, and was shortly to be, at the coronation of Egbert, the capital of all England. A host of memories crowd upon me in the lofty aisles. The severely simple tomb of Rufus—a plain *dos d'ane* of Purbeck marble—conjures up a picture of the charcoal-burner, Purkis (whose lineal descendants still follow the same occupation in the New Forest), bringing on his creaking wain the Red King's body, over yonder down, into Winchester. The quaint boxes containing the bones of the Saxon Kings recall the days of Edgar, who instituted the "Winchester Measure"; of Athelstan, in whose reign the city held six mints; and above all, of Alfred, pupil of that meteorological saint, St. Swithin, to whom, conjointly with SS. Peter and Birinus, the Cathedral is dedicated. The solemn coronation of the Confessor mingles with the vision of Canute renouncing his crown and placing it over the high altar, and the sweet form of Queen Emma walking unharmed over the heated plough-shares. The painted walls and ceiling of the Holy Sepulchre Chapel, built during the episcopate of Godfrey de Lucy, present frescoes limned fifty years before Cinnabill and Grotto

adorned Florence. While we are examining them, there comes a patter of feet, and Collegers and Commoners pervade the place, their fresh young faces contrasting with the stern Norman architecture of the transept, as they flit through the arched galleries of the triforium. It is the hour of prayer for the students of that famous College of Winchester, which Henry VI. took for his model in framing the rules for his new establishments at Eton and Cambridge.

So we leave the great temple, with the clear voices of the Wykehamists echoing in the unison of plain song along the lofty aisles, and turning down the Slype with its quaint

METROPOLITAN ASSURANCE OFFICE.
MESSRS. ASTON WEBB AND BELL, ARCHITECTS.

Latin subscription, "This way for prayer, that way walking" wander in the Abbey Gardens, which have, of course, a limpid branch of the Itchen running through them. Then up the winding High Street to the towers of the West Gate, and as we make our way to the station we feel sorry to leave the old city, so rich in memories, so intertwined with the national history. Winchester people ought to be thoroughly English. As we whirl through the pleasant Hampshire country we have retrospective visions of the

tombs of Saxon kings, of the Codex Wintonensis and Alfred, of the "Long Meads," and the College with its famous motto, which, freely translated, is "Work, walk, or be whopped," and of the dark uniforms of the Rifle Brigade and the "Sixtieth," which took us back to warmer climes and the memory of dear comrades.

Correspondence.

The Editor welcomes Correspondence on matters of general interest. Gentlemen thus addressing the Editor should condense their communications as much as possible.

To the Editor of "THE BUILDERS' JOURNAL,"

Hornsey Park Road, N.,

Feb. 22nd, 1895.

SIR,—No less an authority than the President of the Local Government Board recently gave it as his opinion that ventilating shafts would be necessary before long at the House of Commons, owing to the defects in the sewerage system adopted there. In making that remark he struck, unconsciously it may be, upon what, to our thinking, will, with modifications, be the only cure for the evils which attend the present and faulty main drainage of the metropolis. The remedy that we would suggest is that towers should be erected—they need not be unsightly, if possible on eminences,—which, while ventilating all sewers, should be so fitted as to cause all the noxious gases to pass through fire, thus emitting nothing noxious into the air, destroying all contagion germs, and treating sewer gas very much in the same way as dust and similar refuse are treated in the "destructors," where all is consumed by fire, the resultant being ejected into the atmosphere far above the housetops. This would prove a big and costly undertaking, but we venture to think some such device will have to be adopted ere the inhabitants of the metropolis will be able to congratulate themselves upon having a passable drainage or sewerage system, or upon freedom from ever-recurring epidemics of contagious disease. The present plan of ventilating drains is one full of danger, and this is constantly demonstrated by the large numbers of children who in working class neighbourhoods fall victims to diphtheria and typhoid, these diseases being contracted from the street gratings when the youngsters are at play or on their way to and from school, when, sometimes, through an insufficiency of food, they are very apt to "take" the germs. A walk in the late evening, when the sewers are not crown full, and also in the morning, when they are at rest and to a certain extent empty, will be demonstrated to any one with a nose, the effluvia which arises at those times from many of our street open gratings being particularly noisome, and many a victim's illness and death from typhoid fever can be traced to an inhalation of this sewer gas. In such a city as London, and in face of the enormous outlay incurred in the laying down of our huge main drainage system, such a condition of affairs is criminally dangerous, and calls for an early remedying by the authorities that be, either by some such destructive means as that above hinted at, or by some other, and possibly better. Expensive the remedy will be, but that should be no drawback in such a city as London.

Yours obediently,

W. NORMAN BROWN.

THE large stained-glass window, with illustrations from the life of St. Peter, which has been placed on the south side of Riddlesden Church, Keighley, is from the studio of Messrs. Powell Brothers, of 30, Park Square, Leeds.

ARCHITECTURAL IRONWORK: CONSTRUCTIVE AND DECORATIVE.

*A Series of Instructive Papers for the
Artist and Worker.*

CHAPTER I.

INTRODUCTORY AND HISTORICAL.

THE use of metal in architectural construction cannot lay claim to a very remote antiquity, at any rate in Europe or America. Some other metals—simple or compound—appear to have been employed by the ancients to a considerable extent as *decorative* building materials, but not to a small extent even in a *constructive* capacity. The very free employment of thin *laminæ* in Solomon's Temple is a case in point, and it appears tolerably certain that some of the ancient nations—and amongst others the early Greeks—covered the internal walls of many of their more sumptuous edifices with plates of bronze, ornamented with *relievi*, produced either by founding or some process analogous to *repoussé*. None of these slabs have, it is true, been found in their assumed position, as they were far too valuable to primitive folk for that, and were doubtless torn down when the edifices to which they were attached were demolished or desecrated; but deep cavities in antique stonework still extant show the holes made to receive the shanks by which the bronze slabs were attached to the walls.

For ancient constructive architectural ironwork we must go beyond the boundaries of Europe, and, curiously enough, to a most unlikely race, the one which at the present day would be wholly unable to deal with such a material as iron. Not far from the city of Delhi, in Hindustan, stands the famous Lhât of Delhi, or Pillar of Delhi, an iron column of over fifty feet in height, and about sixteen inches in diameter, surmounted by an ornamental capital, and bearing a Sanskrit inscription. There can be little, if any, doubt that this column is an architectural member, and a very fine one. It is supposed—as some portion of it is embedded in the earth—that the pillar may even be sixty feet in its total length. General Cunningham, in his report, describes this column as of cast iron, but Mr. James Fergusson, the eminent architectural authority, and some other competent observers, declare that it is of wrought iron—an opinion to which I personally lean. This diversity of opinion, and the extraordinary fact that so large an architectural member should have been produced amongst Orientals, unprovided with machinery, more than two thousand years ago, invest the Lhât of Delhi with great technical interest, and has made it the subject of much discussion amongst experts. Mr. Mallet, the highest English authority on the metallurgy of iron, observes anent this column:—"We are obliged to consider that this pillar is *not a casting*, but is a huge forging in native Indian or some other Asiatic-made wrought iron, and if so, the question arises, how was it forged? We have no evidence that 'blooms' of more than 90 lbs. or 100 lbs. each were ever made by Indian methods; these would be too small to build up singly into a bar of sixteen inches diameter. It is, however, conceivable that such little 'billets' as were procurable from such blooms might be welded into bars, and these bars made into a faggot, out of which such a bar, by *sufficient means* for bringing it to a welding heat, and for then hammering it, might be welded into a cylindrical bar, such as this Indian pillar. Now, the limits to the size of a faggot that can be welded with given means of *heating it*, is found to be, where the mass is so great, in proportion to the power of the furnace, that the exterior of the mass, where the heat

is being applied, oxidises and melts away owing to the slowness of heating, and hence long continuance of exposure to the heat as fast as piece after piece is laid on to make up for the waste. This limit has been reached before now even in our best reverberating forge furnaces; it actually was touched upon at Liverpool in forging the Mersey Company's great 13-inch gun. Unless, therefore, the ironworkers of India between the third and fourth century *Anno Domini*^{*} possessed air furnaces and lofty stallas, or blowing apparatus of some sort, on a scale now unknown, and indeed not conceivable in any form of native apparatus, we may confidently affirm that no faggot to form a welded bar of sixteen inches diameter could have been by any possibility brought to the welding heat at all, or without such waste as to prevent its ever being forged. If we pass from the heating of such a bar to the forging of it our difficulties are still greater. The limit in the size of *hand forged* work in Europe was about reached in days gone by in the heaviest 'best bower' anchor of a ship of the line. The largest section of the anchor-shaft when welded to the arms was about eight inches, or perhaps nine inches across, and the welding was effected by the blows of twenty-four 'strikers,' trained to strike in time, and swinging 14 lb. to 18 lb. sledges. The shower of blows dealt for some minutes' spell upon the mass of iron of this large section produced a very insignificant effect, so that both the faggoting and the welding were often very defective, and the 'strikers,' who had to stand close in a ring within the short distance for swinging the sledge from the glowing iron, were greatly scorched by its radiated heat, and some, with fine skins, were unfitted for the work." In this connection I may note that Mr. James Fergusson has found ancient Hindoo beams of wrought iron of 21 feet in length and 8 inches section, which had evidently been made for architectural members, which demonstrates that the ancient Orientals were in this, as in many other matters, far in advance of the barbarian Franks.

With this digression I come more to the immediate matter in hand, when I find that the earliest use of iron in English architecture was about the commencement of the present century, when builders began to appreciate the use of the metal for such purposes as columns, storey posts, beams, girders and roof-trusses. The initiation and rapid development of the railway system in England still later tended to render the use of iron general, as it was found well adapted for the architecture of terminal and large stations, and what I may term an accident caused it to become yet more popular, when Sir Joseph Paxton, when gardener at Chatsworth to the Duke of Devonshire, designed and constructed some large conservatories, employing no other materials than iron and glass. The half century had nearly expired when the late Prince Consort conceived the idea of a Great Exhibition of the Arts and Industries of all Nations, to be held in London in 1851. The idea at once "caught on," and plans for an immense building were solicited. Paxton called to mind his conservatories, enlarged upon the idea, and sent in a design for a gigantic structure composed of iron and glass only. The novel idea was accepted, and soon the fairy structure rose "like an exhalation" on the southern side of Hyde Park, and at the close of the Exhibition it was removed to Sydenham, where, as the Crystal Palace, it still remains.

This then may be looked upon as almost the first practical employment of iron in building, a use which is becoming more and more adopted every day until it would almost appear to have attained the acme of utility.

^{*} The date is far too recent. The Lhât is doubtless many centuries more ancient.

Having touched thus briefly upon the history of ironwork in buildings, I purpose in the succeeding chapters treating of the various portions of architectural ironwork, in a manner which I hope will be useful to my readers, especially the younger workmen among them who may be setting out on the path of industrial life. In my next chapter I shall treat of "Columns."

(To be continued.)

THE LABOURING MEN.

Who are the labouring men?

We are the labouring men:

We who stand in the ranks of trade,
And count the tallies that toil has made;
Who guard the coffers of wealth untold,
And ford the streams of glistening gold,
Who send the train in its breathless trips,
And rear the buildings and sail the ships;
And though our coats be a trifle fine,
And though our diamonds flash and shine,

Yet we are the labouring men—

The genuine labouring men!

We bolt the gates of the angry seas,
We keep the nation's granary keys;
The routes of trade we have built and planned
Are veins of life to a hungry land.
And power have we in our peaceful strife;
For a nation's trade is a nation's life;
And take the sails of our commerce in,
Where were your "artisans' pails of tin"?
Ay, where were your "labourers' then"?
For we are the labouring men!

WILL CARLETON.

"WHERE THE RUDE FOREFATHERS OF THE HAMLET SLEEP."

SHAKESPEARE, as every one knows, was buried in the chancel of the church at Stratford, where there is a monument to his memory.

Chapman and Shirley are buried in St. Giles'-in-the-Fields.

Marlowe, in the church of St. Paul's, Deptford.

Fletcher and Massinger, in the churchyard of St. Saviour's, Southwark.

Dr. Donne, in Old St. Paul's.

Milton, in the churchyard of St. Giles',

Cripplegate.

Butler, in the churchyard of St. Paul's,

Covent Garden.

Garth, in the church at Harrow.

Pope, in the church at Twickenham.

Swift, in St. Patrick's, Dublin.

Savage, in the churchyard of St. Peter's,

Bristol.

Parnell (the poet, not the politician), at Chester, where he died, on his way to Dublin.

Dr. Young, at Welwyn, in Hertfordshire, of which place he was the rector.

Thomson, in the churchyard at Richmond, in Surrey.

Collins, in St. Andrew's Church, at Chichester.

Grey, in the churchyard of Stoke Pogis, where he received his "Elegy."

Goldsmith, in the chancel of the Temple church.

Falconer, at sea, with "all ocean for his grave."

Churchill, in the churchyard of St. Martin's, Dover.

Cowper, in the churchyard at Dereham.

Chatterton, in a churchyard belonging to St. Andrew's, Holborn.

Burns, in St. Michael's churchyard, Dumfries.

Byron, in the church at Hucknall, near Newstead.

Crabbe, at Trpwbridge.

Coleridge, in the church at Highgate.

Sir Walter Scott, in Dryburgh Abbey.

Southey, in Crosswaite Church, near Keswick.

Thomas Campbell, in Poets' Corner, Westminster Abbey.

Browning, in Poets' Corner.

Tennyson, in Poets' Corner.

TO ARCHITECTURAL STUDENTS.

THE Editor of THE BUILDERS' JOURNAL is authorised to make a very interesting announcement to Architectural Students who are willing to turn a few of their hours of study into profitable use. We are instituting a

SERIES OF OPEN COMPETITIONS

expressly for their benefit, and these Competitions will be carried out in every respect as the more serious and important ones of ordinary practice. We shall advertise each month for competitive designs, from students who are under twenty-five years of age. Applications must be made by letter in the ordinary way, and these applications must contain the writer's assurance that he is a *bonâ fide* student and under the prescribed age. He will then receive by post the details and all particulars of the Competition. The drawings must be addressed to the Editor, under conditions which will be stated, and he will adjudicate upon them, selecting six of the best sets sent in, submitting them to an independent assessor in the person of some well-known practising architect, who will make his award and which, of course, will be final. Certificates, signed by the assessor, will be presented to the authors of the three premiated designs and a cheque for half-a-guinea forwarded to them to defray their out of pocket expenses. At the end of the session the thirty-six premiated designs will again be submitted to a body of experts—preferably a committee formed from the twelve monthly assessors—and upon their report a valuable

Gold Medal and a Cheque for £10 10s.

will be presented to the fortunate student who has, in their opinion, done the best aggregate work. A public exhibition of these thirty-six designs will be held. The result of the monthly awards will be announced in our columns and the assessors' reports will be published in full. The drawings will remain the property of their authors, but we shall reserve the right to publish any we think fit.

Here is our first advertisement.

TO ARCHITECTURAL STUDENTS.

The Proprietors of THE BUILDERS' JOURNAL invite Competitive Designs from Students, under the age of twenty-five years, for a

Sea-side Bungalow,

on a sloping site overlooking the sea. The scheme will consist of the Bungalow on one or two floors, and a small Entrance Lodge with Stabling for two horses. The cost of the work must not exceed the sum of £2,000.

Designs to be delivered under cover and addressed to the Editor of THE BUILDERS' JOURNAL, not later than Monday, the 25th day of March next.

Intending competitors can obtain full particulars of the instructions and

conditions, post free, by applying by letter to the Editor of THE BUILDERS' JOURNAL, giving the assurance required, and marking their envelopes "Competitions."

Talbot House,
Arundel St., Strand.
Feb. 26th, 1895.

SAWDUST.

The fine old tower of St. Mary's Church, Brecon, will shortly be re-opened after having undergone a very careful restoration under the superintendence of Mr. F. R. Kempson, F.R.I.B.A., of Birchyfield, Herefordshire, and of 16, High Street, Cardiff. Great care has been taken to preserve the old work, and where it was found absolutely necessary to insert new work, every precaution was taken to ensure that it corresponded to the old work. The bells have been taken down, repaired, and rehung, including new bell framing by Messrs. Taylor & Son, of Loughborough. Messrs. Collings & Godfrey, of Tewkesbury were the contractors, who have carried out the work in a most satisfactory manner.

MR. ERNEST H. ESSEX, C.E., of Nottingham, has been unanimously selected for the office of chief assistant engineer and surveyor to the Urban District Council of Kettering. There were 97 applicants for the post.

PAPER is being used for insulating purposes for three main telephone wires that are being laid in Nottingham.

It has been decided by the London School Board that in future all contracts for building work shall contain a clause requiring payment of wages, to all workmen employed, at the scale fixed by the Federation and Association Agreement.

CARDIFF is a funny town, with funny people. Some there are who oppose the move of the Taff Vale Company's works to a better site; others object to an honorarium being given to the town clerk and borough engineer for special and very important work. Verily, such towns deserve to be served by trades union officials, rather than by some of the very best men in the kingdom. Then, they don't support their electric light works, though it is to their interest to do it; but they are agreed "that a new town hall and municipal buildings be erected on the present site and the sites to be acquired; and that the borough engineer be requested to prepare and submit to the Town Hall Committee instructions and conditions upon which competitive designs may be sent in by architects for the erection of a new town hall and municipal buildings upon the present site and sites to be acquired."

THE Consultative Council of the Building Trades Exhibition, to be held again this year at the Agricultural Hall, has decided that the handicraft competitions of 1894 shall be renewed and much extended. Work is to be submitted to various trial stresses to prove its quality, and to these trials the public will be admitted. Lectures on the Adulteration of Cements, Past and Present Architecture, Electricity in Building, Sanitation, &c., are to be arranged for during the time the show is open.

MR. W. WYBROW ROBERTSON, of Edinburgh, has prepared plans for the erection of a new general post office at Dundee. The designs are at present in the hands of the quantity surveyor.

A NEW fire brigade station is shortly to be erected at Maida hill, Paddington.

THE Church of All Saints, Hertford, erected in the place of the one destroyed by fire, was recently dedicated by the Bishop of St. Albans. The building has been completed from designs by Messrs. Paley, Austin & Paley, of Lancaster. The total cost has exceeded £15,000.

THE governors of the Bedford Infirmary have decided to erect an entirely new building.

Owing to the pressure on our space, "Trade and Commerce" is held over till next week.

THE surveyor to the Town Council of Guildford has presented plans for the new cattle market, and stated that the contract would be divided into two sections—one for builder's work and one for ironwork.

The School Board of Heckmondwike has adopted plans of a new school proposed to be erected in High Street, at a cost of £12,000.

AT Burnley, the Board of Guardians has decided to apply to the Local Government Board for sanction to expend a sum not exceeding £10,000 for the purpose of completing the erection of an infirmary adjacent to the workhouse of the union, in accordance with plans to which the Local Government Board has affixed its seal.

THE Vicar and Churchwardens of Wakefield have received an offer of £1,000 from Colonel W. W. Clapham, of Manchester, for the erection of a new reredos in Wakefield Cathedral. The work will be executed under the direction of Mr. J. Oldrid Scott, whose father was chiefly responsible for the restoration of the cathedral.

DACRE LODGE, at Cockfosters, between Barnet and Enfield, was on Friday, 8th inst., destroyed by fire. It dates back to Charles II's reign, and was probably a lodge of the forest which formerly surrounded it. The present occupier is Mrs. Gladstone, widow of Mr. Robert Gladstone, of Manchester, cousin of the late Premier. The fire broke out soon after midnight at the top of the house, and, owing to lath and plaster partitions, spread the more rapidly. The plate, drawing-room and dining-room furniture, and a library were rescued from the fire, but much was destroyed. The left wing, which is of later date, though damaged by smoke and water, was saved. It is estimated that damage to the amount of about £10,000 was done. On an upper wall there was a fresco outline depicting a hunting scene of the time of James I.

It is stated that the scheme for the new theatre in Richmond is progressing. Mr. Etherington has evinced great energy in the floating of this scheme.

THE Hartley Institution of Southampton, has met to consider the question of raising the necessary funds for carrying out a scheme for the proposed alterations and additions to the Royal South Hants Infirmary.

New educational buildings are to be erected at Kingston-on-Thames. The architect is Mr. Chambers, of Brighton. His estimate for the Corporation building is £4,500, and for the County Council portion £3,270, the ultimate extension of the Corporation premises being estimated to cost £1,300.

New Board Schools are being erected at Stratford, and special consideration has been given to the ventilation, which will be carried out on the Boyle system, the latest improved form of the patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

IN reply to a communication from the Clerk-enwell Vestry, the London County Council has resolved to contribute £350 towards the widening of Farringdon Road.

THE North Berwick drainage scheme is to be carried out according to the plans of Messrs. Belpage & Carfrae, engineers, Edinburgh. The cost is estimated at £1,300.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the work.

COMPETITIONS.

**COUNTY BOROUGH OF WEST HAM.
COMPETITION.**

The Council of the County Borough of West Ham propose to ERECT a TECHNICAL INSTITUTE and PUBLIC LIBRARY in Romford Road, and they hereby invite Architects to submit DESIGNS for the same in competition.

Premiums of £250, £150 and £100 respectively will be paid to the Authors of the Designs which are placed by the Assessor first, second, and third in point of merit.

The Competitor to whom the first premium of £250 may be awarded will be employed as Architect, and will be remunerated in accordance with the schedule of professional practice and charges of architects, published by the Royal Institute of British Architects, such remuneration being independent of the premium.

The Council have appointed Mr. J. MACVICAR ANDERSON, F.R.I.B.A., 6, Stratton Street, Westminster, W., as their Assessor and Professional Adviser.

Designs are to be delivered at the Town Hall, West Ham, E., not later than FOUR p.m., on WEDNESDAY, 1st May, 1895.

Full particulars of the instructions and conditions can be obtained on application to the undersigned, on payment of a deposit of One Guinea, which will be returned in the event of the applicant either submitting a Design, or returning the instructions within one month from the date of receiving them.

By order of the Council,

Town Hall, West Ham, FRED. E. HILLEARY,
January 21st, 1895. Town Clerk.

IPSWICH.—MARCH 23.

DESIGNS are invited for the Building of a WORKHOUSE and INFIRMARY, with Specifications and Estimate. Premiums £100 and £50. My. A. F. VULLIAMY, Clerk to the Guardians.

TO SANITARY ENGINEERS.

100 GUINEAS PREMIUM.

PARISH OF HEMEL HEMPSTED.

The Rural District Council of Hemel Hempsted hereby offer a PREMIUM of 100 GUINEAS to Sanitary Engineers for a SCHEME for CARRYING OUT A SYSTEM for the SEWERAGE and SEWAGE DISPOSAL of this Town so as to meet the requirements of the entire area of the parish and town for which provision has to be made.

The scheme to be accompanied by plans, and an approximate estimate of the cost, to be delivered by the 1st JUNE next.

Full particulars of the conditions under which the premium will be awarded may be obtained on application to the undersigned.

WALTER GROVER, Clerk to the Council.
Hemel Hempsted, Feb. 13th, 1895.

Moderated Progressivism.

THE Progressives will be disappointed by the result of the London County Council Election. The Moderates have marvellously increased their numbers and parties bid fair to be very evenly balanced. In this may lie safety, for one side may well play watch-dog upon the other. In a smallness of majorities—it is the fashion just now to assert—lies wisdom, and, while not accepting the aphorism in its entirety, we are inclined to think that a fair show on both sides may result in a decent and consecutive policy, providing members refrain from the temptation to shy brickbats at each other. The prolonged stir in the air over this municipal matter has been a little amusing. Our politico-cum-partisan daily papers have revelled in it, and an excited contemporary has gone so far as to employ Burne Jones. The result was eminently satisfactory in the art and the pictorial senses, but, politically, Progressivism would seem to be rather out of the bill with the London public. We believe, emphatically, in the good government of London; architecturally, sanitarily, and in the thorough administration of the streets, parks and buildings, but we look with dismay upon such municipal business becoming politically capitalised and tintured with alien bitterness and imperial consequence. London should be able to administer herself, equally with the large provincial cities and towns: Glasgow, Liverpool, Birmingham and Manchester. But there should be less hubbub and less humbug, less cant and contrivance, and more honest, sincere, and ingenuous willingness to do the best for the millions who live in the metropolis, have their dwelling, take their enjoyment, and earn their bread. We have regarded with a somewhat indifferent interest the columns of controversy flooding our contemporaries' pages; the limitless advice, the paraded turtle, the belated beadle trotted out by Progressives as bogies to the play. There is broad laughter in the easy way in which the Progressives have forgotten their own to scoff at the Moderate bogies, bogies summed up in the wild fear of a Commune, and in the general hint that the streets should be barri-

caded else blood might flow. This spirit of exaggeration on both sides is very silly, very mischievous, and very likely in the end to defeat its own object. People cannot be aroused for ever by turgid hyperbole and rubbishy rhetoric. London is fairly complacent; she asks for such improvements as the gods may send her; she is willing to admit that reasonable and real progress is needed, and she is patient enough to wait the

merited scathing criticism without a doubt. What we should like to see is a unification of parties as well as the much vaunted unification of plans. Principles and plans may well follow a public spirited and an united policy, and if the London County Council would cease from internecine troubling, even the wicked—and certainly London!—would be at rest. The election has been a toil and a turmoil. Though it seemed to us voters

scarcely realized the importance of the day or the magnitude of issues, yet, to judge by the voting, London may be said to have done her duty fairly well. She has, at anyrate, chosen her Council for the next few years, and may all the Beatitudes inspire its labours. The L.C.C. can do with a little inspiration. There has been respiration and rhetoric enough.

Something Easier. WE are not prone to conundrums, and we never in our lives solved a missing word. There is a lazy lesion in our intellect that shuns the sad-faced problems set forth in the comic papers. It is so much more comfortable to let well alone. We are only reasonably anxious to do better. The puzzle papers never made their millions by this attitude, which we commend to our readers, it being uncopyrighted. But we have been startled by the question: When is a house not a house? This is a teaser. We could have answered the question: When is a house a blank bad house? or, When is a house the topsy-turvydom of home? or even so prosaic a matter as: When is a house fit to live in? This is about the run of the average interrogation that stirs our daily contemporaries to their depth in the gooseberry season. Architecturally, too, we might have our doubts—even going so far as to indulge in disputes upon style, or of the exact significance of a wall panel. But a house not a house? The Englishman's home not even his hovel! We face it. The question comes before the benign countenance of THE BUILDERS' JOURNAL. A Mr. Croall, a commercial traveller, took a house, Ash Grove, Leeds, for the summer. The Ash Grove is something more than a happy domestic air, but there were some infernal bad smells about that militated against harmony. When we state that Mr. Croall's wife and two children were shortly suffering from blood-

BUCHAN HILL.—THE STAIRCASE.
ERNEST GEORGE AND PETO, ARCHITECTS.

natural and legitimate development of her resources, without any philandering on the one hand or salamandering on the other. The ratepayers are right in keeping a chary eye upon the money, and yet at the same time we are sure that the stingy policy is, in the long run, the reverse of an economic policy. The past condition of London has

merited scathing criticism without a doubt. What we should like to see is a unification of parties as well as the much vaunted unification of plans. Principles and plans may well follow a public spirited and an united policy, and if the London County Council would cease from internecine troubling, even the wicked—and certainly London!—would be at rest. The election has been a toil and a turmoil. Though it seemed to us voters

poisoning, it will be inferred that the Ash Grove was not exactly a summer-house. Only one thing could happen and that was to open the door to the sanitary engineer; insanitary engineers had been there before. The result of much internal disturbance revealed the usual and shocking state of things. What odd drains there were outside the house had undergone a subsidence. In moderately plain unforcible English they had become blocked up. On expeditioning the dining-room floor—always a deadly and dangerous business—an old rubble drain was discovered, full of foul drainage, which oozed up through the soil and formed stagnant pools. Mr. Croall and family had seen enough. There is only one outlook in such circumstances—the sea. It is a big outlook, and it is not absolutely divorced from drains. But, down by the sea, foul drains get a little fresh air, so to speak. Mr. Croall, having removed his poisoned family, promptly refused to pay his rent. He was thinking, no doubt, of the delicious days (and general financial drain) by the sea. To reimburse him in this he set up a counter-claim, £50

drainage." In the upshot it follows that if you go modestly and mildly into a house without the legal "warranty" aforesaid, you have no redress, and your only remedy is your doctor. On the face of it, it would seem that a "house" certainly needs defining, and a "dwelling" some elucidation. For ourselves—after this County Court dictum—we prefer to be asked something easier.

THE INTRODUCTION OF THE PULPIT.

IN the early Christian times it was the custom for the Bishop to preach from his raised *cathedra*, but, on account of its great distance, as the place of the Bishop was at the background of the altar-niche, even Chrysostom and also Augustine made use of the ambon, which was nearer to the congregation; such ambons are still to be seen in many churches of Italy. Out of the ambon was developed, in the thirteenth century, the pulpit and the name *Kauzel* is retained in Germany as the reminiscence of the choir,

"THE PALACE OF THE PEAK."

CHATSWORTH, the home of the Cavendishes, is a "lordly pleasure house" enough, though scarcely one "wherein to dwell." The cold splendour of its halls chills you more than a little; its prerogative is that of a palace; it wears no familiar air and you feel its stately condescension. It receives you and speeds your departure with a cool, scrutinizing gaze; in every way an aristocrat in stone. It was curious to see the little sitting-room in so great a house, where the late Duke—fond as he was of architecture and of archæology—managed to make himself comfortable. Chatsworth was never his favourite residence; he buried himself in it and among his books for some season of the year. At other times the windows showed their blinds to the World. Yet Chatsworth is surrounded by the loveliest scenery in the English Midlands; you ramble by rapid waters or climb abrupt hills to find romance enthroned; you discover good timber, steep scarrs, dainty dales and dim ravines; old-world towns; pleasant inns to

be thankful of; even model villages—a more enigmatical advantage. It is amid such surroundings as these that Chatsworth shines in its white stone dazzling in strong sun-light; somewhat of a white elephant—in fact. I am told that the Duke of Devonshire absolutely loses by Chatsworth; it swallows no small revenue. But it is, indubitably, one of the show places of England, and in the completest sense a stately home.

The façade of the house faces the river, and the prettiest glimpse of Chatsworth is from the bridge shown in our illustration. Critics may differ as to the architectural excellence of this façade. But the open balustrade which surmounts the frieze is elegant enough and the Ionic fluted pillars and pilasters are valuable as relief, and

CHATSWORTH.

damages. Now we come to the stern, unbending and County Court moral. The Judge has decided that the rent must be paid. In more picturesque parlance, the Ash Grove was a habitable house. We are not surprised. Most people connected with building smile gently upon all habitable houses, and the nice point arises: what is the exact condition entitling a house to be regarded as "wholly unfit for human habitation." Foul smells do not, nor does shocking sanitation. Many a tumble-down tenement is healthier in all safe outward aspect than the flimsy contrivance of modern shoddydom. It would be interesting to have foul smells legally tested. Even a Judge might then scent other wisdom in the air. With regard to Mr. Croall's counter-claim, he has been awarded twelve guineas, a paltry sum that would not cover more than the doctor's bill. What is more important still, is that even this modest justice was only obtained and expressly staded to be given on the ground that the landlord had handed over to Mr. Croall, "a special warranty with regard to

balustrade, *cancelli*. During the predominance of the Romanesque style, the pulpit was formed as a structure of stone, which, as it seems, stood in connection with the screen, or else leant against a pier of the nave. A parapet sometimes ornamented in relief, terminates it; a stone step led down from it behind. The most beautiful pulpit in Germany is that in the church at Wechselburg. While in Italy the pulpits retained the form of isolated structures, resting on columns, and adorned with all imaginable pomp and splendour of material, and of the noblest artistic perfection, in Germany the pulpit was generally on a single column, or a bracket, placed against a pier of the nave, and received the form of a cup, and became the favourite spot for the sculptors to cover with tracery and pictures in relief. As a rule, the four Evangelists or the four Church-fathers were introduced on the parapet under canopies.

A MISSION Church and hall are about to be built in Paddock Street, Hanley, from plans by Messrs. R. Scrivener & Sons, of that town.

break up what would otherwise be rather a monotonous face. The base is rusticated. The frieze is a fine piece of work, containing the Cavendish Arms, sculptured by Samuel Watson. The northern wing is a more recent addition from designs by Sir Jeffrey Wyatville and differs from the rest of the mansion in being a compound of Corinthian, Doric and Ionic. Chatsworth is one of the best domestic specimens of its style—a style much in vogue at the end of the last and in the early years of the present century, when every mansion must have its portico and its pediment to be worthy its name, and Ionic and Doric were great words to conjure with. But the lack of variety in treatment, and the absence of all such play as the Gothic gives, makes the description of even the home of the Cavendishes a prosaic matter; one looks in vain for any surprise, any quaint fancy stuck in unexpected place, or a window daring from its fellows; a gargoyle, a grimace so to speak, in stone. The first view of Chatsworth is the final view also; you remember the block rather than its beauty,

and a sense of size rather than of suggestiveness is what you bring away.

Almost any day in the season a little group of folk may be seen gathering outside the remarkably fine gates of wrought iron that effectually bar further progress. By and by, at a comfortable hour, a janitor conducts you onward, and next, a trim maid, wearing very much the aspect of a reduced duchess, takes you round, forbidding undue questions by the very magnificence of her manner. You are not permitted to loiter, and so your impression of the interior is as blurred as your exterior view is single and solid. The corridor leading out of the Sub Hall is worth looking at for its tessellated pavement, and has some busts of moment. The floor of the Great Hall is laid in mosaic by Henry Watson, son of the carver Watson who worked the frieze. The decorations, illustrative of the career of Julius Cæsar, are by Verrio and Laguerre, and are highly interesting. Derbyshire quarries have been utilised in the Great Hall and the Grand Staircase with exquisite effect, and again in the State Apartments, the door-cases of which are of the variegated marble for which the county is known and noted. It is to the State Apartments that the majority of visitors hasten, eager of interest, and prodigal of approval.

The ceilings by Verrio and Sir James Thornhill, luxuriate in allegorical subjects; Paris gives Judgment, and Aurora is engaged in her usual pastime of chasing away Night. The floors are of mosaic work, oak being employed. Fancy woods line the room, covered with very fine Gobelin copies from the cartoons of Raphael. An interesting point, with regard to the remarkable wood carving in these rooms, has been long debated. Some ascribe it to Gibbons, but there is no proof, while documents attest to the work of Watson and his associates. The probabilities are that Gibbons lent counsel and advice to the work, even if he did not supply some of it. It is interesting to recall Horace Walpole's eulogium: "There is no instance of a man before Gibbons who gave to wood the loose and airy lightness of flowers, and chained together the various products of the elements with a free disorder natural to each species."

The carving, whoever it be by, is to my mind, one of the most beautiful features at Chatsworth. A very striking piece of work is the "Net of Game." Other objects you are shown in the State Rooms—objects of personal importance, no doubt, such as the state chairs and footstools used at the coronation of their Majesties George III. and William IV., and a fine portrait of the late Duke, by either Vausomer or Myteurs. In the State Bed-room is the bed upon which George II. died. There are also tokens and trophies of Louis XIV., the Czar Nicholas, and other august visitors, and busts of a host of Cavendishes.

The South Galleries claim you, and you discover sketches by Titian, Rubens, Salvator

Rosa, Raphael and Claude Loraine. There is more fine carving and statues by Cibber, father of the notorious Colley of that ilk. Then the altar piece in the Chapel should be seen. There are eminent old masters, for the seeking, enough and to spare in the Drawing Room—a shapely apartment—and the Dining Room has treasures of its own, including reputed portraits by Vandyke and a Godfrey Kneller. The profuse way in which marble has been used in Chatsworth is very apparent in the Dining Room. The doors are surmounted with pediments supported by Ionic columns of Siberian jasper and African marble. There is a deep plinth of polished marble round the room; the chimney-pieces are masses of sculpture, and jasper and spar side tables are fitted to the walls.

All this seems but a prelude to the Sculpture Gallery, one of the famous sights of Chatsworth, and of which we give an illustration. Here it is possible to admire Canova's celebrated "Mother of Napoleon," exquisitely finished, the hands being remarkably modelled, or a wounded Achilles, by Albicini; a mosaic from Herculaneum, or

magnificence can do has been done, and if we prefer, after all, the baronial severity of a Norman tower, or a mullioned Elizabethan, or the wood and plaster of Tudor days, it is because each of these seems to perpetuate a bygone English era, whereas the Classic in England has no vital story to tell.

THE EARLY USE OF BURNT TILES.

IN the North German Lowlands, that is, on the coasts of the North Sea and the Baltic, with the Lower Rhine, the Mark of Brandenburg, eastward far into Prussia, and southward into Silesia, the want of natural stone led early to the use of burnt tiles or brick. As, however, most of these countries only became subject to Christianity in the course of the twelfth century, they adopted those forms of architecture which then reigned in the rest of Germany, that is, the late Romanesque, principally with a mixture of the elements of the Transition epoch. In the Romanesque time the use of brick caused the decay of the column Basilicas. As a rule, the nature of the material suggesting it, the pier was adopted,

CHATSWORTH—THE SCULPTURE GALLERY.

Shadow's chaste and delightful "Spinning Girl." Those who love Sculpture—and are not these, indeed, men who *build*?—can learn lessons to last them well into their years at Chatsworth. Throughout the house Sculpture is in evidence; you cannot get away from it. Here busts by Chantry, there by Wickmann; and the general sense of marble and spar and jasper and stone and space that Chatsworth gives you may account for that chilly air and attitude to the stranger of which I have before spoken.

It is when you have descended to the gardens, this being in the summer time, that you seem to reap a happiness of colour. The place has Paxton's reputation to keep up as well as its own, and right well do the gardens still testify to his genius. The fountains, the orangery, the immense palm-house—fore-runner of the Crystal Palace—the cascades, make the hours linger agreeably until one is loath to leave, driving away in the long sunlight of a June evening with regret.

Chatsworth is happy in having little history, no telling story or tradition adds romance to its walls, but all that marbles and

which, however, was soon richly decorated with half columns and other members, and soon led—as early as the eightieth year of the twelfth century—to the vaulting over of the whole church. The abacus of the pier remained much the same as that of the stone one, generally, however, with the greatest possible simplification of the members and of their arrangements. The transformation of the capitals principally on the half columns was especially energetic. Here, also, the form of the cushion capital was relied on, but instead of the abacus being developed by segments of a ball from the round of the column shaft to the square capital in brick building. This transition is accomplished by sections of a cone, so that the sides of the capital are not formed of semi-circles, but either of triangles or of trapezes. The ornamentation of these buildings is very slight, for, as a rule, the chief forms are often of unadorned simplicity. Sometimes, however, lime or sandstone is used for these more imposing parts and then they are formed with those ornamentations peculiar to the Romanesque styles.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
5th March, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

FOLLOWING the example set by the Conservators of the Thames in erecting a new weir, lock, and bridge, at Richmond, the Clyde trustees are about to proceed in a similar direction in the stream over which they have direction. Although the development of the patent sluice weir may really be said to have commenced over a quarter of a century ago, since when Mr. Stoney, the inventor, has been engaged in Madras. The theory of the new weir may be briefly explained as consisting in the provision of moveable sluices designed in such a manner as to impound the upper waters of a river at certain levels, and furnished with mechanism that lifts the sluices out of the river as soon as the flood tide raises the lower water to the same level, thus leaving the entire waterway free for navigation. In a similar manner as the ebb tide subsides the same mechanism leaves the sluices when the fixed depth of impounded water is reached. A wooden float attached to the upper side of the sluices endues them with sufficient automatic buoyancy to permit the passage beneath them of flood water, such arrangement being altogether independent of the mechanism controlling the tidal waters. In appearance this new class of weir can readily be mistaken for a bridge only, though it is this on both sides only, where there are footpaths, the centre being left open to enable the sluices to be brought up when it is necessary to raise them, these turning upwards and lying horizontally when out of use, the appearance being materially improved by this ingenious contrivance. These weirs are now to be found in the Manchester Canal to control the waters of the Irwell and Weaver; on the Rhine, near Geneva; on the Nile, in Egypt; and on Loch Earn; and now one is to be built on the Clyde, which will have three spans of 80 feet each, with a headway above ordinary high water level of 18 feet under the centre of the arches, the total cost being estimated at £45,000, a saving of £20,000 as compared with that at Richmond, which cost £65,000. We venture to think that when completed this new weir will meet with much appreciation from the frequenters of and dwellers on Clutha's stream.

THERE are numerous ways of extracting stones from clay, but slinging is, perhaps, the cheapest. It consists in cutting the clay as it issues from the ejectment hole of the pug-mill into lumps of about two feet long and slicing them into pieces of about half-an-inch (not more than three-quarters of an inch) in thickness. The implement used is called a sling, and can be wielded by boys. During the slicing most of the stones fall out of the clay. The rest are plucked out by hand.

ATTENTION has been called to the condition of several of the frescoes in the House of Lords. It is stated that one or two are in a shocking state, indeed, almost past repair. The report of the expert, who has been asked to advise, should suggest some speedy remedy, else restoration will be impossible, for a man, however able, cannot restore what does not exist. The frescoes in the upper waiting-room are particularly bad, and many of the others are going. If the condition of these wall paintings in the House of Lords is to be taken as a criterion, it would seem as if frescoes were fated to disappoint us.

THE new Slade Professor of Fine Arts at Cambridge, Dr. Waldstein, is a native of New York, and his degrees come partly from Columbia College and partly from Heidelberg. Fifteen years ago he began to lecture on Classical Archæology at Cambridge, and he succeeded Mr. Sidney Colvin at the Fitzwilliam Museum. Later on he resigned the directorship to become the head of the American School of Classical Studies at Athens; but two years ago he returned to his earlier love at Cambridge, though still retaining his Athenian Professorship. Dr. Waldstein has written some highly interesting essays on the Art of Phidias.

CARDIFF Architects are very agitated just now, for they have got a "burning question." We are sorry the new museum and art gallery are so dangerously ablaze, but have hope that a little reason will act as an effectual sprinkler. Mr. Bruce Vaughan, the President of the Architects' Society, has been interviewed. "The question involved," said Mr. Vaughan, "is simply whether Mr. Seward has been retained by the Corporation as Architect for the new museum and art gallery in Park Place. Mr. Seward says he has; members of the museum building committee say he has not." Now this seems to us rather a remarkable situation, and one which will need some unravelling. For it appears that Mr. Seward, who is the immediate past president of the Society, was appointed, under resolution of the Council, Architect of the library extension, which included, at that time, the museum and art gallery. The site for the museum and art gallery has been changed, and ground has been obtained from the Bute Estate, on the definite understanding and with the provision that the designs should be thrown open to public competition. Obviously, if this provision is to hold good, Mr. Seward cannot be the Architect for the new edifice unless he wins in open fight. But, *per contra*, the Corporation has not rescinded its original resolution appointing Mr. Seward Architect of the whole scheme. It is further admitted that Mr. Seward has done work in connection with the new site for the museum, but "only in an honorary position." We are a little at a loss to understand the position of an Architect professionally employed on one portion of a scheme and working in an "honorary" capacity upon another section, while appointed Architect of the whole by corporate resolution. The Corporation of Cardiff would seem to have landed itself in a cleft stick. It should either rescind its original resolution or else settle with Mr. Seward. The contention that a Corporation has a right to change its Architect for another portion of a particular scheme is perfectly tenable, providing sufficient reasons be adduced. As matters stand, Mr. Seward seems to us to be protected by the Corporation's own original resolution.

THOSE who take a pleasure in pastels should look in at 148, New Bond Street, where Mr. Gifford Dyer is exhibiting some charming pictures of Venice. Mr. Dyer is an American, one whose work is well known in

Paris, and is winning its way quietly in this country. There are over forty pastels on view, and they give us flashes of Venice; the incomparable tints of dawn and sunset, and the wonderful mists that hang over the lagoons like silken veils—the delight and the Tantalus of a host of artists. Pastel work has a charm all its own; and Venice seems to lend herself to the new treatment with a grace becoming her beauty.

THE failing health of Lord Aberdare seriously interfered with his usefulness on the Aged Poor Commission, so that his death will not in any way abruptly affect the enquiry. But it is singular that he should have died the day before the report was submitted for signature. Undoubtedly, his lordship knew more about the Poor Law than any other statesman, and his close application to the work of the Commission was but another evidence of his sincerity and singleness of purpose. The Poor Law is a reluctant subject; one scarcely calculated to send a man happy to dinner, but men like the late Lord Aberdare are of the elder and more earnest school, who find their work in somewhat unwelcome and ungenial fields. We are not prone to believe that the millenium is to be found in Royal Commissions. A Commission is, often enough, a piece of complex machinery, bewildering the public and grinding its Commissioners to dust, but the Aged Poor Report should contain more than the average amount of valuable matter, inasmuch as Lord Aberdare threw all his sympathy into the enquiry, and was particularly painstaking in testing the sources of information brought before the Commission. He was a man of exceptional grace of manner, and in his day one of our least obtrusive, but most effectual, heads at the Home Office.

A NEW building material is coming into use in America. It is made of $\frac{1}{8}$ in. strips of wood, from $\frac{3}{4}$ in. to $1\frac{1}{4}$ in. wide, placed between two sheets of heavy strawboard, and united with common cement under a heavy pressure. It is called compo-board, and its strength, compared with its weight, is said to be marvellous. The ends of an 18 ft. board can be brought together without breaking or warping it. When papered, the finish is as fine as upon any plastered wall. It is said that its cost is not more than that of first-class plastering; that it forms an absolutely air-tight wall, stiffens a building, is quickly put on, produces no dampness, and forms a more solid, cleaner, warmer, and drier wall at no more expense than the customary way.

THERE was much of interest in Miss May Morris's paper on "Mediaeval Embroidery," read before the Applied Art Section of the Society of Arts, last week. The use of tapestry in mediæval days was co-equal with its ornament. Fresh air played round the baronial mansion boisterously, and many a Gobelin concealed a gap. The arras served the purpose of screens and cosy corners, and concealed more things than feudal flirtations. Miss Morris pointed out that ecclesiastical embroidery was undertaken by great ladies as no holiday pastime, but in as business-like a way as in the church schools or lay guilds themselves. The two opposing characteristics of the Gothic spirit were an eager boldness and a fanciful inventiveness and imagination. Miss Morris did well to dwell upon the sterling character of this industry in the thirteenth and fourteenth centuries. Our knowledge of history and of ornament has been helped by the mediæval embroideries that have been handed down to us, and their vivid subjects have befriended the mind's eye by piecing together the details of the past.

A LECTURE on the "Ideals of Painting" was given by Professor Baldwin Brown in the Art Gallery, Glasgow. The branch of art to which he principally limited his remarks was decorative mural painting, a branch he chose because it had already been little treated of and was a subject of great importance to an urban community. He pointed out that little had been done by painters of this country in the way of mural decoration, and, consequently, its methods were imperfectly known in Great Britain, but it was a department which ought to be encouraged in Glasgow, whose school had the good fortune to possess artists fitted to shine in that department. After indicating how the ideals of painting and the standard of excellence among early Italian artists differed from those of later painters of Spain, Flanders and Holland, and especially how vastly Rembrandt had widened the field of art, Professor Brown proceeded to dwell particularly on fresco work. He chose as his principal example the great decorative paintings of the roof and east wall of the Sistine Chapel, by Michel Angelo. After illustrating the manner in which that Titanic artist bent the architecture to his own purposes, Professor Brown showed in detail the various decorative subjects with which he filled the space at his disposal. The lecture was illustrated with a full series of lantern slides of the Sistine Chapel compositions, and in addition to these a number of the most famous pictures and of the fresco decorations of other public buildings were shown and commented on in a most graphic manner.

THE clock for which Big Ben strikes the hour is the largest in the World. Looking at the dial from the northern footway of Great George Street, or from the Embankment, it looks as if its diameter might be equal to the space that a man of medium size could cover with outstretched arms. This estimate hardly does the dial justice, for its diameter is 23 feet. From the ground the minutes on the dial look like ordinary minutes, and as if they were close together. As a matter of fact, they are a foot a-part. The numerals are two feet long. The minute hand, with the counter-balance—the heavy end that projects beyond the centre of the dial—is fifteen feet in length. The clock-room is an apartment about 15 ft. square. Fully a third of it is occupied by the works. The clock is wound up by hand; it is wound up twice a week. The winding is done by two men who are supposed not to have a weak spot in their frames. Each winding-up occupies four hours. Big Ben, in comparison with the other four bells, looks like the Giant Sire of four promising sons. Lying on the floor is his old clapper. It is an oblong piece of iron 2 ft. long, 12 in. in diameter, and weighs 750 lb. Had not an accident happened to Big Ben, his tones would be even louder than they are. Before he was placed in position, some of the workmen amused themselves by striking him with sledge hammers in order to make him speak. In response to one blow, he replied in a cracked voice. What happened to the unfortunate workman is not known. In order to repair Big Ben's voice, the crack was cut away until the tone of the bell was again true. Twenty men could stand under Big Ben in a rainstorm and escape a wetting, if the rain fell in an exact perpendicular and stayed where it fell. About a foot from the mouth on the exterior, is the following inscription: "This bell weighs 13 tons 10 cwt. 3 qrs. 15 lbs. It was cast by George Mears, of Whitechapel, for the clock of the House of Parliament, under the directions of Edmund Becket Denison, Q.C., in the twenty-first year of the reign of Queen Victoria, and in the year of our Lord, 1858."

LORD RAYLEIGH, whose experiments have created so much interest, tackled an old theory in his lecture at the Royal Institution on Saturday afternoon, and found it strictly scientific. Antiquity may now add Truth to its hoary crown, while Tradition's tale is undimmed. Speaking on "Waves and Vibrations," Lord Rayleigh reiterated the archaic advice relative to pouring oil on troubled waters. Not only was the practice one belonging to remote Time, but there were strict reasons for its use. The oil gave a stiffness to the waves and left patches of smoothness which resisted the water. Lord Rayleigh pointed out that the absolute truth of this was demonstrated by water in a trough agitated by an electric motor, for, after oil had been thrown on, the lines of resistance to the mimic waves could be clearly discerned. Of late years those engaged in navigation have given more than a thought to this effect of oil. Now that the adage has received the *cachet* of scientific consideration we may expect the speedy introduction of "greased travelling" by steamship. Perhaps this will be the nearest approach to "lubricated lightning" we shall ever enjoy!

IN supplement to our remark, in a recent issue, on Mr. John Wolfe Barry, C.B., we give, in the present issue, a portrait of this most distinguished engineer, together with some supplementary particulars of his career. Mr. John Wolfe Barry, who crowns a brilliant career with his work in connection with the Tower Bridge, is the fifth and

youngest son of the late Sir Charles Barry, R.A., and was born in 1836, and is, therefore, now in his 59th year, and the zenith of his professional powers. He was educated at Trinity College, Glenalmond, where his elder brother, the Rev. Alfred Barry, afterwards Bishop of Sydney and Primate of Australia, was sub-warden; and at King's College, London. To acquire a practical knowledge of work he was placed with Messrs. Lucas Brothers, the celebrated builders and contractors, and was afterwards articulated to Mr., now Sir John Hawkshaw. Whilst with this gentleman he was engaged as resident engineer on the bridges over the Thames and the large stations at Charing Cross and Cannon Street; and, as a fact, Mr. Wolfe Barry has done a considerable amount of work for railway companies, he having been the architect of St. Paul's and other stations on the Chatham and Dover system. On quitting Sir John Hawkshaw's service in 1867, he commenced to practice on his own account, and has carried out the Lewes and East Grinstead Railway, the Earl's Court Station, and the Ealing and Fulham extensions of the Metropolitan District Railway, the new bridge over the Thames at Blackfriars, the railways for the completion of the "Inner Circle" of the metropolis, in conjunction with Sir John Hawkshaw; the Barry Dock, near Cardiff, which is the largest single dock in the United Kingdom, and railways connecting it with the South Wales coal-fields, and a large number of less important undertakings. Mr. H. M. Brunel, son of the late Isambard Kingdom Brunel, and grandson of Sir Isambard Brunel, joined Mr. Barry in partnership

in 1878, and has been associated with him in most of the above-mentioned works. In 1872, Mr. Barry visited the Argentine Republic, and laid out a railway from Buenos Ayres to Rosario, and in 1886 the Government appointed him on the Royal Commission on Irish Public Works, and important legislation based on the reports of the Commission has taken place on the subjects of drainage, light railways, and fishery harbours. In 1889 he was nominated, jointly with Admiral Sir George Nare, K.C.B., and Sir Charles Hartley, K.C.M.G., on a commission ordered by Parliament to settle certain important matters connected with the river Ribble; and in December, 1889, he was appointed by the Government on the Western (Scottish) Highlands and Islands Commission, a body having similar objects to those of the above-mentioned Irish Commission. Mr. Barry is a member of the Council of the Institution of Civil Engineers, a member of the Institution of Mechanical Engineers, an associate of the Council of the Surveyors' Institution, a fellow of the Royal Institution, and a lieutenant-colonel of Volunteers, besides being the author of a few works—the whole making up a busy and brilliant career, which we hope has many more years yet to be added to it.

Down in Chelsea, snugly away in a little side alley, suggestively known as The Vale, you may find Mr. T. Stirling Lee quietly at work. Mr. Lee gave a demonstration lecture on Friday night, at the Architectural Association meeting, on "The Use of Sculptural Decoration at the Present Time;" but it is rarely he comes out of his shell. It is as likely as not you may find a notice on Mr. Lee's studio door begging of you to neither knock nor ring. Mr. Lee has been busy on his panels for St. George's Hall, Liverpool, and we hear a whisper that Mrs. Grundy has been somewhat overcome by Mr. Lee's introduction of the nude. Liverpool is a little Pecksniffian at times, but Mr. Lee is so kindly disposed a man he may speedily be forgiven.

MR. H. STACY MARKS, R.A., has ventured a prediction upon British Art. He is a bold man, with an eye dipping into the future, and he finds that the twentieth century is going to be "bright." We are glad to hear it. Mr. Marks' optimism is encouraging, and the only little difficulty to be overcome is the "commercial depression" from which the country is generally suffering. But "depressions" have acquired the bad habit of lingering, and both varieties—industrial and climatic—are unwelcome guests. A very general acquaintance with trade points to the possibility of recovery, but it will come slowly. The "baneful influence upon the Arts" will not rise like a thunder-cloud. Mr. Marks realises that book and newspaper illustration has the most cheerful and immediate outlook. In painting and sculpture Mr. Marks says: "But allowing that we have few geniuses in our midst, we have many Artists of great and varied talent. In sculpture, study has become more serious and conscientious, with more learned rendering of form, and greater appreciation of beauty."

EVEN more pertinent are the remarks of Mr. Marks upon architecture, contained in the excellent article in *Great Thoughts*. "The most unobservant," he says, "cannot walk along the streets of the Metropolis, or of any of our large provincial towns, without being struck with the fact that architecture has advanced, by leaps and bounds, from the lame and impotent abortions so characteristic of the earlier days of the present century. A few brief years rolled by, I see, in fancy, a day when our towns and cities will be made beautiful, when our public buildings—Architect and Painter working harmoniously together—shall present a combination of

stateliness and symmetry; when our squares and open spaces shall be enriched with fountains, and with statues freed, by the aid of science, from the grimy blackness and negro-like aspect consequent on exposure to fog and filthy air; and when the people will be educated to admire rather than to injure a monument." This reads a little like a rhapsody, but we should welcome the time. Mr. Marks suggests many scientific panaceas, but his frank-hearted enthusiasm has not soared to the skies. Perhaps someone else will decide as to the manner of their scouring!

ELECTRICITY has won a victory over cable traction. The Leeds Corporation, acting on the report of their special sub-committee and the estimates of the City Engineer, have finally decided in favour of the electric system for the local tramways. Three rival systems were in the field, but practically the choice lay between cable traction—similar to the system at work between Kennington and Streatham Hill—and the electric system, which has been preferred. The estimated initial cost of the latter is £378,499, as against £428,922, the initial cost of the cable system. The annual cost of working shows a like advantage in favour of electricity, the estimates respectively being £90,072 and £101,819. The former estimate, however, is said to be based on the assumption that the overhead wire system would be adopted throughout, whereas the sub-committee recommend that in the centre of the town the conduit system should be substituted. The conduit system is, without doubt, the better fashioned, the wires being carefully stowed away. We have seen the overhead wires at Leeds, and distinctly regard them as we should Dr. Fell—with dislike. There is something clumsy and cumbersome in the very appearance of overhead wires, and in America they have distinctly proved a danger.

At Oxford, Mr. Ruskin was sometimes suspected, we believe, of partiality for particular pupils; but, according to Dr. Furnivall, who supplies some interesting particulars, his attention at the Working Men's College was given to all alike. "He used," we are told, "to teach every man singly; sit down on each man's stool in his turn, show him where he was wrong, praise him where he was right, and chat in the most pleasant and friendly way. It was a treat to hear and see him with his men. When he found a fellow with brains and love of art, who wanted to work at it, Ruskin put the student in the way to get it, and didn't spare his money for

the purpose. One man abused his kindness and did nothing, though Ruskin kept him on the Continent for some fifteen years, while the man professed to be studying and painting. But the rest—Allen, Ward, and Bunney—were great successes. Ruskin's only inducement to keep at the college was his own generous nature. He took infinite pains over, and interest in, the work, and spent a lot of money upon it." There is much incidental evidence of Mr. Ruskin's generosity and thoughtfulness. He found Mr. Ward pupils, sent him to the sea-side when he was ailing, and enabled him to go on sketching-tours on the Continent. For another working-men's drawing-class, started in 1861, Mr. Ruskin provided all the neces-

it were mechanical; what he did find fault with was want of perception. A student once came with his copy of a 'Liber Studiorum' etching, in which he had entirely missed the feeling of Turner, and Mr. Ruskin, looking at him searchingly, asked him if he had been ill."

HERE are a few extracts from letters of general interest. Mr. Ward had written from Tenby; Mr. Ruskin replied: "I don't call cliffs 200 ft. high insignificant; in the Alps I should call one diminutive that was under 1,500 ft. The last I saw there ran up 9,000 ft. in a great concave. But a 200 ft. one is as 'significant' if you have feeling for it." At another time he writes to Mr. Ward at

Dinant: "I was sure you would enjoy the Meuse and the Flemish architecture; and, for my own part, I can assure you that, though for general enjoyment in natural beauty and for exercise, I go to Switzerland, for purposes of art I should rarely go beyond the French and Flemish landscape and buildings. A river is, in most of its circumstances, far more picturesque than any lake. You get two shores dove-tailed together instead of a single independent one with an horizon-line, and the motion of the water and traffic furnish endless incident."

ARCHITECTURALLY, the Chapel Royal, St. James's, is one of the least pretentious of the historic buildings of London. Its boxlike form, and its plain, almost forbidding, exterior, are in the worst style of the Georgian era. Nor is the interior more calculated to impress the visitor. There is a fine ceiling, divided into small painted squares, attributed to Holbein; but, otherwise, the adornments are of the plainest description. High-backed oak benches, as uncomfortable as they are ugly, occupy the floor space, and running round three circles of the building, are galleries, much after the style of the old-fashioned meeting-

house. In the last century, the Chapel was much frequented by Royalty. George III. worshipped there regularly when in London, and in the literary records of the period we have an interesting description of how he proceeded to his devotions, with a nobleman carrying the sword of state before him, and herald, pursuivants, and other state functionaries marching in his train. If we are to believe Madame D'Arblay, the service was better appreciated by the King than by his suite. The latter would drop off one by one, until his Majesty, the parson, and an equerry were left, in the words of this lively lady, "to freeze it out together." In later years the Chapel has been similarly used by

CATHOLIC CHURCH, FOLKESTONE.—MR. LEONARD STOKES, ARCHITECT.

sary materials. "I get requests now," he wrote in the following year, "on the average for about £50 a week, and all difficult to refuse."

MR. RUSKIN'S great object as a drawing master was to make his pupils feel and see the beauty in things. "He made everything living and full of interest, and disliked service copying and 'niggling.' Excessive care he admired, but not work for work's sake. To show this, he would make a rapid drawing by the side of a student's work, that he might see how, with all his elaboration, he had mixed the 'go' of the thing. He never cared to find fault with your method, unless

members of the Royal family who have occupied apartments in St. James's Palace, and it has also occasionally been the scene of memorial services on the occasion of the death of Royal personages. For these purposes of purely domestic worship the edifice is not badly adapted; but it is most unsuitable for a state ceremony of an important kind. At the outside not more than 400 persons can be squeezed into it at once, and it does not afford the least scope for effective display.

FOOTPATHS, bridle-paths, rights of way and private roads have ever been the bogie of the builder. There is something intolerably annoying in the discovery of an ancient "right" at the very corner-stone, so to speak, of a projected building. What business has the "right" to be there? is a paradoxical but sound question. Sir Robert Hunter has a jealous eye. Moreover, he desires a "run" on such cat-like optics. He dwelt lingeringly on "Footpaths" at Toynbee Hall, on Saturday night, and was all in favour of ancient rights of way and past-time privileges. Some people, of an enquiring turn of mind, had definitely asked Sir Robert "What was a footpath?" The thing is sufficiently obvious to the ordinary intellect, but we bar the legal mind. The legal mind is very maudlin upon footpaths. But Sir Robert Hunter, of stout heart, set forth to essay a definition comprehensive in its note of finality. "A footpath was a public right-of-way for foot passengers, and was dedicated by the owner to their use. It was a maxim in law: 'Once a highway always a highway,' so, therefore, each dedication need not be proved by deed or act on the part of the landlord." We expect the ordinary person will now ask—having plenty of leisure—"What is a highway?" and we are not sure that the Law can answer. For ourselves we have known even highways to be closed, but we are aware that this is a humorous country. In parenthesis, many highways belie even bye-ways in condition, but we presume that Sir Robert Hunter's clarity of legal conviction will now set no small herd a horseback, riding down old walls and beating through recent fences. By all means let us retain our footpaths: English Right of Way is above and beyond mere considerations of convenience.

A CHAT WITH LEONARD STOKES.

A RUB FOR THE ACADEMY SCHOOLS.

"I POSITIVELY hate terra cotta," said Mr. Leonard Stokes, F.R.I.B.A., as he stood by the fireplace in one of his quaint little rooms in Westminster. It seemed to me he soon got up steam. "I loathe the way it is commonly used; the endeavour to imitate stone. There are situations in which it may be tolerated, but terra cotta is not true nor dignified. It is impossible to obtain accuracy of line—take the attempt to build pillars of it and look at the result! Nothing but messy littleness will suit such a material. But you must not mention terra cotta to me; it has got me into too much trouble already!"

"Then I may describe the effect upon you as that of the proverbial red rag!"

We both laughed, and Mr. Stokes confessed:

"Well, you know, I am a bit of a firebrand and I love to stir things up. But terra cotta is my *bête noir*. The leases fall in in Regent Street in a year or two, I believe, and I expect we shall have an end to inoffensive stucco. Flats and terra cotta will reign rampant, but the second state of that street will be worse than the first."

I had had time to look round the artistic little room with its drawing board inspired by a distant view of the Clock Tower and by

countless crooked chimneys in the middle distance. The warmly tempered walls were bright and gay with impressions in oil, vigorous canvases by Mr. Stokes' brother Adrian, the well known painter. Here a harvest moon rose full upon sheaves of corn, and there sea and sky seemed meeting in a mystery; "sketches," Mr. Stokes called these kindred things. Chippendale chairs gave you honest support, and an old carved chest contained many drawings.

I charged Mr. Stokes with having had a birthplace and he admitted it. He could not tell the hour; not being a Royal Academician by birth it had not been chronicled, but he came into a dingy world at Southport, pretty well thirty-seven years ago. His recollec-

tions are mainly of sands and donkeys until he came up to London with his people, in 1871, and began his three years' training with S. J. Nicholl, in 1874. Later, he spent some time with James Gandy, quantity surveyor; became clerk of works under Street at Christ Church Cathedral, Dublin; did work for Colcutt, Bodley, and Garner and St. Aubyn, and obtained the Pugin Travelling Studentship in 1880. Mr. Stokes has strong views concerning the Royal Academy Schools.

"They want re-organising. They are dull as ditch-water. I advocate a thoroughly efficient and energetic staff of masters, and the Schools should be open in the daytime. Fancy a Royal Academy open but two hours a night for three nights a week! It is ridiculous. The Schools and the masters want to be brought more in touch with modern ideas and architectural requirements, and the students should draw from the life amongst other things; at present the classes are very

perfunctory indeed. I wish you could get Mr. Norman Shaw to take the matter in hand. He is the man to rouse the Schools out of their lethargy, if he would only take the trouble. Street did it, and thoroughly remodelled the system while he was there, but of late years things have slipped back a great deal. The 'art' side of a young architect's training is neglected, while what I may describe as the 'Institute side' is well rubbed in."

"And the Association, Mr. Stokes?"

"The Association is a first-rate thing for the younger men. I should like just to say that although I have retired into what, I suppose, may be described as private life, I still take great interest in the Association. You know I was president for two years, and vice-president for two more, besides serving on the committee for six years as well. Since the Association was rebuilt it has done, I think, an excellent work on the lines of education as opposed to cramming."

"Then you don't believe in cramming?"

"I do not. I think a man should absorb and assimilate his knowledge by slow degrees; then you may reasonably expect individual and sincere results. Individuality may be slow to succeed, but it is what we want in architecture."

Then I knew I trespassed upon ticklish ground when I breathed the word "Institute!"

Mr. Stokes has little or no quarter for the Institute, laughingly remarking that he was "too hot" for that august body, but he wished someone "would stir up that Institution." I suggested that "firebrands" were known to be inflammable. Possibly Mr. Stokes would himself direct the battery! But he did not unmask his artillery. We fell to talking of less polemical matters. Mr. Stokes confessed to a predilection for ecclesiastical work, and showed me several charming drawings of Roman Catholic churches of which he was the Architect, notably St. Clare's church, in Sefton Park, Liverpool, and a church in Folkestone.

Mr. Stokes gives one the impression of a keen controversialist, a man of individuality and artistic as well as architectural feeling. He has no patience with the slow moving and the easy going, and his description of himself as a "firebrand" may be taken either as a confession of innocence or of guilt.

THE Secretary of State for Foreign Affairs has received through H.M. Consul at Cadiz information to the effect that the Seville Waterworks Company, Limited, will receive up to March 8th, tenders for the supply of material and construction of a footbridge over the River Guadalquivir. Printed specifications, estimates, and conditions may be seen at the Commercial Department of the Foreign Office, S.W.

NAZARETH HOUSE, BEXHILL.—MR. LEONARD STOKES, ARCHITECT.

ANNOUNCEMENTS.

Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

THE EDITOR does not hold himself responsible for the opinions of Correspondents, whose communications should be brief and plainly written on one side of the paper.

THE BUILDERS' JOURNAL goes to press on Monday at 6 p.m. All matter must reach the Editor by the first post on Friday morning to ensure its treatment in the current issue.

Publishing.

The terms for free post Subscription to any part of the United Kingdom is SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments. Subscribers in London or the Suburbs receive their copies by the first post delivery on the day of publication.

Advertising.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS WANTED.

Per line (about 10 words), Sixpence.

Minimum charge, Eightpence.

Three Insertions for the price of Two.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE AND GENERAL ADVERTISEMENTS.

Four lines (about 40 words), Three Shillings.

Each additional line, Sixpence.

Prepayment in the above Advertisements is absolutely necessary.

The charge for Paragraph Advertisements on the Front Page is Fifteen Shillings an inch, single column. Minimum charge, Five Shillings. Paragraph Advertisements on ordinary page, single column, Seven Shillings and Sixpence per inch.

MANUFACTURERS' ANNOUNCEMENTS ON ORDINARY PAGES.

Per Page, Single Insertion, Eight Guineas.

Discounts for series on application to the Manager, who will make Special Contracts for Announcements on Back and Leader Pages and positions facing matter.

NOTICE.—Advertisements for current week's issue are received up to last post on Saturday. Alterations in standing Advertisements must be made before 6 p.m. on Fridays.

Advertisers in THE BUILDERS' JOURNAL may have their replies addressed to the Manager's Office, free of charge, and may have them forwarded if addressed envelopes sufficiently stamped are sent.

Reading Cases, lettered in gold, may be had from the Manager. Price, One Shilling.

MEN WHO BUILD.

No. 4.

MR. ERNEST GEORGE.

It must be nearly ten years ago when you begged permission to join a merry party of men bound for the delightful scenery of Crawley, in Sussex, and

Ernest George's latest masterpiece of "Buchan Hill," which he had just completed for M. Saillard. You linger yet with the memories of a delightful day. The broiling walk from the station straggled out the little band of forty enthusiasts, until the dusty Sussex lane seemed dotted for a mile or more with the broad cloth of Conduit Street. Cole Adams, and Beresford Pite—he had not then migrated from Bloomsbury to more aristocratic quarters in Hanover Square—Francis Miller—the man of figures and price books, and a poet, too, forsooth—Atkin-Berry, the then genial hon. sec. of the A.A., a man of never-wearying kindness, and thought for others—George Blagrove—now with an "ism," and a haunter of the reading rooms of Bloomsbury—"Maurice B"—whose bland countenance is still a redeeming feature of the monotony of Bedford Park—and a dozen others who have drifted from your ken, were of the party. Your heart is keen on the beauties of Buchan Hill. As they enthralled you then, they enthrall you now. So intently did you study the charm of that lovely hall, and the corridor which ran along the north front, the beautiful paneling and the mullioned oriels of the drawing rooms; the oak staircase—which you are fortunate to be able to illustrate—and the amazing perfection of the kitchen and "domestic arrangements" of the delightful house, that you well remember being locked in by the watchman on duty, and having to drop, in a very undignified fashion, over the wall of the servants' yard, to regain the party.

What emphasizes Ernest George's work, as much, perhaps, as its distinctive charm, is the extraordinary attention he gives to minute things. Like poor George Street, nothing is too insignificant in a house for

his personal touch. To the handle on a coal cellar door, Ernest George is in evidence. To him a moulding is a moulding, a thing of beauty and a joy for ever, and so his mouldings under a pantry shelf are as refined as are their more fortunate sisters who exist in the aristocratic surroundings of my lady's boudoir. Ernest George is a master of small things, and that is why his houses are "equipped" so perfectly, and why he is such a master of domestic planning.

You do not know where Ernest George was born, but it is six and fifty years since that interesting event happened, and nine and thirty since he went to Samuel Hewett, of the Adelphi, to draw straight lines and

discover the difference between a brick and a paving stone. Samuel Hewett has not engraven his name upon the architectural records of his day, for he peacefully sleeps the sleep of the just, and none of his works have lived after him. It is evident, therefore, Ernest George got no inspiration from the Adelphi. When he was nineteen years of age he became a student at the Royal Academy; and the following year went home with the Gold Medal. At twenty-two he met Thomas Vaughan, just back from his tour through Europe, and so the youngsters started in practice on a third floor in Cannon Street. When the Albert Hall was first opened with

REDROOFS: MR. ERNEST GEORGE'S HOUSE AT STREATHAM.

A Local Government Board inquiry is being held at Southampton as to giving powers to the Corporation to buy up an extensive area of slum property in the ancient part of the town, and effect a vast improvement by the erection of workmen's dwellings and model lodging-houses.

MESSRS. E. WEBSTER and Co., of Radfield Quarries, Eccleshill, near Bradford, have secured for twelve months in each case, the supply of Yorkshire flags (self-tooled) kerb, channelling, etc., for the Corporations of Newcastle, Nottingham, and Walsall, and local corporations in the South of England.

an Architectural Exhibition, George and Vaughan showed their designs for a Mountain Villa and Bodegas, which the late Duke of Wellington was to have had built as part of his scheme for wine growing on his Spanish Estates; but this was never fully carried out, though it gave Ernest George his first opportunity of visiting Spain. This partnership with Vaughan, although fairly successful, did not long survive the third floor, and, eventually, Ernest George entered into partnership with a son of Sir Morten Peto, and thus laid the foundation for what was destined to be a very prosperous artistic arrangement. Mr. George has expressed his views, more than once, in favour of a system which is derided by many of those artistic fanatics who cannot see an inch in front of their eyebrows. Those who know Ernest George well, know that the frictions of architectural practice would soon wear away the polish of his art, and that is why he so strongly believes in the advantages of partnership, when wisely entered into with a man, whose treatment and up-bringing makes him competent to deal with the petty worries and complications which arise in actual work.

Poles, in Hertfordshire, for Edward Hanbury; at Shiplake Court, for Mr. Harrison; and Motcombe, Dorset, for Lord Stalbridge, a different rendering of the same treatment becomes apparent, and the simplicity of the true artist is carried sometimes to its extreme limits. But in his interiors Ernest George has unquestionably no superior;—it is a very grave point if there be his equal, grave indeed to those who, like yourself, worship at the shrine of one Norman Shaw—he casts simplicity to the winds, and every inch of wall space, not otherwise treated, he panels, as they did in the days before wall papers with pedigrees were invented, and people had got so shockingly modern in their domestic requirements. Mr. George is the only architect who has seriously touched upon the charms of etching, and his published works, illustrated by his own needle upon the copper, are well known. John Murray published his "Mosel and Loire"; Seeley his "Belgium," and the Fine Art Society his "London" and "Venice"; whilst every Londoner is acquainted with the chromo reproductions of his water colour drawings of bits of London architecture.

what active Fellow of the Royal Institute. He believes in sketching, it has such a refreshing influence on one's work, he says, and at every odd moment the sketch book is his companion. He does not believe it possible to examine a man architecturally. A man should be known by the structures he has built, and not by the drawings he may have made.

Great baskets of sweet-smelling logs appear in the rooms in Maddox Street, and the curling white smoke from the hearth lazily floats away into the unknown, as you saturate yourself more thoroughly with the works of Ernest George which appear upon the walls of the dimly lighted rooms. There is a son articulated to his father, and of whom much is expected. He has a fine ideal to aim at, the ideal of a pure Artist, and one of England's finest builders of the beautiful. Ernest George has devoted the whole of his life to the domestic side of his art, and he need not fear that his name will live far into the centuries to come. But if another century dawns, and Ernest George is still without the gates of the Royal Academy, a monstrous injustice will have been done to the Architecture of England.

MOTCOMBE, FOR LORD STALBRIDGE: ERNEST GEORGE AND PETO, ARCHITECTS.

There is no less assertive practitioner than Ernest George, and in his partner he found the antithesis to himself, although Mr. Peto is a man of extreme artistic culture and taste. The partnership thus wisely entered into lasted until three years ago, when worn out with repeated attacks of influenza and other troubles, Mr. Peto retired after fifteen years' incessant work; and Mr. Ernest George associated himself with Mr. Arthur Yeates, a gentleman of much business and commercial acumen.

Ernest George makes a picturesque centre figure in a picturesque room in Maddox Street, and the German shutters with wrought German hinges, which subdue the light from the German glazed windows, seem to take one to the origin of the peculiar style of nineteenth century work which he has made his own. It is idle to disregard the north German feeling which has crept into his work, a feeling most rampant in the Cheapside elevation for Messrs. Hill, and in some of the houses in Collingham Gardens, South Kensington. When, however, Ernest George gets fair play for his pencil, in such instances as at

Ernest George makes all his perspectives with his own hand, but more charming than these, even, are those delightful elevations, strongly washed in sepia, which are likewise peculiar to him. He is a most rapid draughtsman and colourist, always stands at his work, and matures most of his brightest conceptions at Redroofs, on Streatham Common, a front view of which is on the preceding page. The internal arrangement of Redroofs is distinctly clever, and you regret Mr. George strongly requested the plan should not be given. It possesses some remarkably fine paneling in the actual spirit of the fifteenth century, and the studio which is 45 feet in length is, perhaps, one of the finest rooms its owner ever completed.

Ernest George is too much occupied a man to trouble his head about the winds which blow round professional societies and their controversies; all his leisure hours are spent with his sketch book, running round the towns and villages of Europe when time and circumstances permit. From its formation, he has been a prominent member of the Society of Painter Etchers, and a some-

THREE plans for a new covered market at York have been prepared by the city surveyor, and will be submitted at the next meeting of the Corporation.

AN extension of the Institute at Ipswich was opened on Tuesday evening. The committee have acquired additional land at the rear, covering 50 ft. by 26 ft., and on this two stories of accessory buildings have been erected, comprising ladies' conversation-room, smoking-room, chess-room, and lavatories. Mr. William Eade, of Ipswich, was the architect, and Messrs. Girling & Coe, of the same town, were the contractors. The site cost £250, and the building operations £850.

THE contract for the alterations and improvements at Knot Mill Station has been let to Messrs. Robert Neil and Sons, of Manchester. The total sum is a little under £20,000. Operations will be commenced as early as possible.

THE Prescot Guardians have decided to order plans for the erection of a new infirmary at Whiston, at a cost of £35,000.

THE Town Council has received the sanction of the Local Government Board to borrow £5,100 for the purchase and laying out of the Crescent Estate at Harrowgate.

THE ARCHITECTURAL ASSOCIATION.

MR. F. W. POMEROY'S PAPER ON "PLASTER WORK."

A MEETING of the Architectural Association was held last Friday night at the Royal Institute of British Architects. The chair was taken by Mr. A. Beresford Pite, and there was a good attendance. The minutes of the previous meeting having been confirmed, the Chairman read the following letter from Mr. Young, who wrote regretting his inability to attend:—

"The subject of sculpture in architecture is a most interesting one, and one which I

in size, in treatment, and in relief, so as to form a harmonious part of the building which the sculptor decorates. I am afraid that in the present day, with a growing tendency to produce sculpture in buildings, we shall get, as we have in other things, a cheap and shabby sculpture. If we employ sculpture at all, we should take care that it is of the very best. It should be sculptor's sculpture, and not stone-mason's sculpture. My advice to you is to avoid this kind of sculpture, as well as all pretence or sham art. If you cannot get the real article do without it.—Yours faithfully,

WM. YOUNG."

decoration at the present time. A great many people, he said, had an idea that there was no use whatever for sculpture, and to show how the subject had been neglected it was generally found that the carving on a building was the worst part of the whole structure. If they put such fearful work into any other part of the building it would certainly be condemned. If they went to the British Museum they would see that the ancients understood the proper use of sculpture. The ancients used it to show the reason of their buildings, in the figurative language, the symbolic language, a language that could be understood. From the very

SHIPLAKE COURT.—ERNEST GEORGE AND PETO, ARCHITECTS.

have done my best to promote, not only in talking and writing, but in actual work, because I believe in it. Sculpture in building has, in my opinion, been too much neglected, and

ORNAMENT HAS BEEN OVERDONE.

One would rather see, in a building, a small amount of really good sculpture, than a large amount of ornamental work. At the same time one must not forget that sculpture on any great scale can only be done on public or monumental buildings; in domestic work it is not likely to hold a large place. I think it is the place of the architect to produce sculpture in place of ornament whenever he has the opportunity, or rather, he should try and make the opportunity. The question of cost is undoubtedly a difficult one to overcome, but I think if we, when the opportunity of using sculpture occurs, put clearly and forcibly before our clients the difference in result and value between sculpture and ornament, this difficulty may be overcome; at least such is my experience. But granted the opportunity to employ sculpture, which is the grandest decorative aid to architectural design, we must take care that it is not merely figure carving in stone, but sculpture of the highest class which we must aim at. In my opinion, sculpture in architectural work brings out the highest qualities of the artist. There he deals with its conception, with its composition, with its proportions, without going into the elaboration of too much detail. For sculpture in architecture should first of all be broad and very simple. It is also necessary that it should be to a scale, both in size and relief, proportionate to the place in the building which it occupies. One has seen in many of the recent efforts to adopt sculpture in buildings, figures of such a small size and so out of proportion to surrounding work, that they look like toy figures, only fit for the Lowther Arcade, and forming no part of the architectural scheme. Not only should the scale be proportionate to the building, but it should not be any random figure stuck in any place, but the whole should be part of a scheme, both in subject,

NEW MEMBERS.

Mr. P. W. Meredith, 38, Woburn Place, W.C., and Mr. J. W. Abraham, 80, Hanley Road, Stroud Green, N., were elected members of the Association.

SCULPTURAL DECORATION.

Mr. T. Stirling Lee then delivered an interesting address on the use of sculptural

BUCHAN HILL.—HALL FIREPLACE.

earliest times when men drew forms on pieces of bone we had always had in our brains something which compelled us to express our thoughts in that way. That was the faculty of thought, of form, and of expression, and the question was how were they going to use it. With regard to big buildings, what could not be written on them! Mr. Lee based his subsequent remarks on the sculpture of St. George's Hall, Liverpool, some of which he designed. He explained how he thought out the subjects for a frieze, and modelled his ideas in clay, and then had to make them harmonize in line and thought with the building itself, and said, if they were going to do anything original it must have

THE DEEPEST THOUGHT TO START WITH.

Light and shade governed the work entirely, and another great factor to be considered was the lines. People were beginning, he was glad to say, to recognise that they could decorate their houses with sculpture, and by putting permanent beauties into their buildings. He thought a chimney-piece was a charming piece of work; but, if they designed a house with a feature like that, they must consider that it should be lighted well. The sum and substance of his advice was that if any of them had an opportunity of doing a feature-like decorative work, they must consider how it was going to look afterwards.

PLASTER WORK.

Mr. F. W. Pomeroy's paper on "Plaster Work," which was then read, was an exceedingly useful one. Plaster of Paris, used by sculptors and others for taking casts, &c., was, he said, well known to the ancients, who obtained from Syria, and probably from other countries, a stone called by Theophrastus "gypsos," which resembled alabaster, and which was converted into plaster by burning in a suitable furnace, grinding and sifting. Having explained the composition and manipulation of various kinds of plaster, Mr. Pomeroy said many architects desired that their ornament should be modelled *in situ*, and he was fully aware of the importance

of this, but had always found that it was quite impossible, under the present condition of buildings, to carry out entirely a design of an elaborate nature, such as

FIGURE WORK, OR INTRICATE FOLIAGE.

Unless one had time for thinking and maturing, a simple design only was possible; and the plan generally adopted was to model, in clay or wax, a piece sufficiently large to form an idea of the scale and projects of the modelling, and offer it up in something like the position it will eventually occupy. But reflected lights, and other reasons, demand that the work should always be considered in a liquid state, i.e., to be worked on and completed after it is fixed. This may be said to apply to all architectural decoration. Where the windows run up close to the ceiling, he found flat or low relief most agreeable, and very high relief was never desirable because it harboured dirt and dust, and threw shadows which became very troublesome to the people who had to live in the room. The charm of much of the old ceiling work, he ventured to think, was enhanced by the many coats of paint, or whitewash they had received, which had stopped up the small blacks in the work, and accidentally given

his particular piece of work "sing-out," without any regard for the *ensemble*. For repeating ornamental plastic models, gelatine, wax and piece moulding in plaster are the methods usually employed. Gelatine is the simplest and best when only a few casts are required, as it can be done without any complications in the case of undercutting; wax moulds are generally used for the so-called fibrous or canvas casts of commerce. Piece moulding is a more complicated way of obtaining reproductions, and is used by moulders who may desire to preserve their moulds for future occasions. For work executed *in situ*, a mixture of Parian cement, well-burnt slacked lime, putty and silver sand is used, but this is more properly stucco-duro. Stucco-duro, as practised by the Italians, is a very ancient method, and is mentioned by Vitruvius. It was almost lost, but was revived again in Italy in the sixteenth century. Raphael and Giovanni da Udine were then so interested by the discoveries during the exhumation of the Baths of Titus, under Leo X., that they at once made experiments in this material, and the loggia of the Vatican was one of the first results. It was composed of plaster of paris, silver sand and marble

netic or parian cement and silver sand carefully mixed together, is laid on very thinly, and the design is cut into the surface of the second coat with a steel scraper. Care must be taken in the cutting, which should be done with slanting edges which give roundness and softness to the finished work. A good draughtsman would have but little trouble in learning this kind of work, and it should commend itself to architects for its durability. Gesso is yet another way of using plaster, but this more properly belongs to the painters' art and is most successful when confined to very low relief work, such as the decoration of frames, caskets, panels of cabinets, &c. There are many kinds of gesso, and fine examples may be seen in Kensington Museum. For bold work plaster of paris and thin glue or size water are used, and for fine work a liquid, composed of whiting previously soaked in water and mixed with linseed oil and a little resin, is used and is laid on with a brush. It can be made very easily and a few experiments will ensure success. He had used

A VERY GOOD POWDER

called "Denoline," which sets hard and slowly and sticks fast—great virtues in gesso. Whiting and parchment size is the gesso used

MOTCOMBE, FOR LORD STALBRIDGE.—INTERIOR OF DINING ROOM AND HALL.

breadth to the whole; and much modern work would be improved by the same treatment. He had tried in ceiling work that he had been engaged on lately, to avoid sharp undercutting, and where undercutting was necessary to give accent to the design, it should be done with a round instead of a sharp edge, and a much softer shadow was obtained. But as each fresh work was a new problem, so the modeller, to have the true decorative spirit, must constantly bear in mind the general scheme of the mouldings that surrounded his work and governed the scale. Perhaps the most noticeable feature in modern surface decoration was overcrowding; and one of the greatest difficulties of the designer was to know

HOW MUCH TO LEAVE OUT

rather than what to put in. Indeed, the designer who understands this quality had got through his troubles, and the value of an occasional plain space cannot be overestimated. Of course, the well-trained figure sculptor understands the value of tone, light, shade and envelopment, but unfortunately the ordinary carver has little or no time allowed to consider such abstruse problems. Consequently his only idea is to make

dust, and was capable of taking a high polish. It can be used for the finest work; and, in fact, is used by modellers for goldsmiths' work as less liable to injury than wax. A

STUCCO COMPOSED

of plaster and glue water is used by modern sculptors, and is preferred to clay for very large work. Mr. Watts modelled his great statue of Hugh Lupus, for Eaton Hall, in this stucco, and the groups in the Trocadero, in Paris, by Falguiere, were modelled in the same material. Stucco work was much employed on the palace of Nonsuch, built by Henry VIII. It was executed by artists brought from Italy, but every trace of the palace has now disappeared. The artists, however, left their influence, and stucco was employed to decorate houses until the end of the reign of Charles II., when it began to decline. Graffits or Sgraffits is another way of decorating by means of prepared plaster grounds, cutting away or scratching through the upper surface and revealing in parts a back-ground of a different colour. The first coat is made of sharp sand and portland cement, and the second coat is usually coloured with Indian red, yellow ochre, or manganese black. A final coating of sele-

by frame makers; and ordinary house-painter's putty worked up with whiting, oil and water is also used for scrolls, &c. Mr. Pomeroy concluded his lecture, which was full of most valuable information as to the best means of preparing, mixing, and modelling plaster, and which explained some of the most important uses of plaster for decorative purposes, by saying that to become thoroughly acquainted with any particular work the student should spend a short time in the workshops, for the secret lay not in the tools or the materials, but in the hand and brain of the worker.

At the close of the lecture Mr. Pomeroy and his assistant proceeded to demonstrate some of the methods of casting, and Mr. Pomeroy also exhibited a photograph of part of a frieze he designed for the Sheffield Municipal Buildings. The frieze illustrated the various arts and manufactures of the district, and Mr. Pomeroy added, the subjects were all taken from Nature.

DISCUSSION.

Mr. Statham, of *The Builder*, in proposing a vote of thanks to Mr. Stirling Lee and Mr. Pomeroy, said he sympathised with the general views expressed by Mr. Lee. If

they had cheap sculpture, either the sculptor was cheated or else the buyer was. There was far too much sculpture which had the appearance of having been turned out by the dozen. It should justify its position on a building by having some reference to it; and its lines should harmonise with the lines and shadow projections of the building. It had always been a puzzle to him to know why the Greeks put the frieze of the Parthenon at Athens in low relief, right on top of a wall and under the shadow of a roof. He should be glad if Mr. Lee could give a reason for it.

Mr. G. H. Fellowes-Pryne seconded the resolution, and said it was always a temptation to an architect to see his building more or less complete, in the fear that if he did not see the sculpture put in during his lifetime, it would never be there. He considered that the expense of good sculpture was the reason it was not used to a greater extent, and the moneyed classes should be taught to know that good sculpture could not be bought cheap. He thought the sculptor and the architect should work more together, so as to understand one another's designs and feelings.

Mr. W. D. Caröe said sculpture should form spaces of light on a building and not of darkness.

The Chairman said it was extremely desirable that architects and sculptors should come into close touch in their work. Architects should understand how sculptors did their work; how they thought it out and studied the effects of light and shade. If they did that, and if sculptors took the pains to understand how architects did their work it would have very beneficial results. They had got into the mischievous habit of regarding certain ornamental sculpture as carving, and excluding from the high range of art any ornament that would not figure ornament. He did not think sculpture need be prohibitively expensive. He alluded to the death of the late Dr. Reginald Stewart Poole, of the British Museum, who was a great friend to the Association, and who said that the process of perfection in Greek art was the process of elimination—of eliminating all that was not absolutely necessary.

The vote was carried by acclamation.

In reply to a question by Mr. Statham, Mr. Stirling Lee said the sculptures at St. George's Hall, Liverpool, were composed of Istrian stone—an extremely hard stone. It was found that the original stone fretted away. With regard to the frieze at the Parthenon, he considered it was a wonderful study of reflected light. It was originally coloured in the background, and he thought the idea of the sculptor was very subtle.

The meeting shortly afterwards adjourned.

POINTS ABOUT FEVER HOSPITALS AT THE R.I.B.A.

MR. T. W. ALDWINCKLE gave a lecture on "Fever Hospitals" at the ordinary meeting of the Institute of British Architects held last week, Mr. F. C. Penrose in the chair. The lecturer said a fever hospital should be, if possible, outside the town or village for which it is intended. The question of transport of the patient is not so serious a difficulty as to outweigh the great advantages to be derived from the hospital having open fields rather than houses as its surroundings. Good ambulance arrangements will overcome all difficulties as to transport. The land should be capable of good drainage, and there should be the means for a good and ample water supply. There should be two entrances to the hospital, one "the infected entrance," and one the "non-infected entrance," both controlled from the same porter's lodge. A

wide roadway should run round the whole of the site, as a neutral zone to separate the hospital from the surrounding property. The axes of the ward pavilion should be, as nearly as possible, north-east and south-west, in order to provide for the maximum quantity of sunlight and the minimum of shade. This is of the utmost importance, and should be carefully borne in mind in the selection of a site. The ward pavilions should not, where practicable, be more than one story in height. He did not suppose that any experienced hospital architect would, by choice, place fever wards one above the other, necessitating, amongst other evils, much traffic up and down staircases, to say nothing of the obvious objections from a sanitary point of view, so that considerations of land area could be the only reason. The whole of the several buildings of an infectious hospital should be completely isolated, and stand perfectly free, without communicating corridors or covered way of any kind. This was not suggested as an experiment, but as the result of personal observation in the case of several excellent hospitals, such as the Eppendorf Hospital, Hamburg; the Moabit Infectious Hospital, Berlin; the Frederickshain Hospital, Berlin; the Urban Hospital, Berlin; the Belvidere Hospital, Glasgow; the Grafton Street Infectious Hospital, Liverpool. It would doubtless be admitted that in an infectious hospital complete and absolute isolation of each ward pavilion, at least, was most desirable, and there should be good reasons adduced for in any way impairing such isolation by the introduction of communicating corridors, even with open sides. It was stated by some hospital authorities that these covered ways are necessary in order to protect the staff from the weather; but, apart from the fact that they are wholly inefficient for such a purpose, the authorities at the hospitals which he had mentioned as being without corridors or covered ways had all assured him that the staff experienced no ill effects or inconvenience whatever from their absence. The complete isolation of the buildings is recognised and prepared for, the nurses and others dress accordingly, and the arrangements for conveying hot food from the kitchen to the wards are so well considered and complete that the food is, in all probability, hotter when it reaches the wards than in the other cases. There should be a clear space of at least 3 ft. between the underside of the ground floor of all wards and the adjoining yard level, and the space thus left underneath the floor should be paved with tar paving. In the acquisition of a site for a fever hospital, the question arises as to the number of beds per acre that can safely be provided. For larger hospitals, he did not think that the maximum should exceed 20 beds per acre. At the Belvidere Hospital, Glasgow, there are 17 beds to the acre; at the Grafton Street Infectious Hospital, Liverpool, 34 beds; at the Moabit Infectious Hospital, Berlin, 40 beds. The requirements of large towns necessitate the provision of a large number of beds; but it is an open question, whether the aggregation of large numbers of acute infectious cases upon one site is desirable, and whether it would not be a preferable course to arrange hospitals for a smaller number of beds, and to increase the number of such hospitals in order to provide for the total number of beds required. If, e.g., the population requires a provision of 400 beds, he would suggest the erection of two hospitals for 200 beds each rather than one for 400 beds; and where the required provision is for 750 beds, three hospitals of 250 beds each might be preferable to two of 375 beds. Indeed, a maximum of 300 beds suggests itself as desirable. Having given illustrations of the various types of existing fever hospitals, Mr. Aldwinckle said there should be two entrances to an infectious hospital,

each controlled by the same porter's lodge, which should, in fact, stand between them. One to be called the "infected entrance," leads to the hospital proper; and the other to be called the "non-infected entrance," leads to the official department, stores, and staff quarters. There should be two receiving wards: one for scarlet fever and one for diphtheria and enteric fever. These two wards should not adjoin, but should be as near as possible to the wards of their respective diseases. Each receiving block should contain a good-sized and well-lighted receiving and examination room, with a bathroom adjoining (the doorways to these rooms being wide), together with a room for the ambulance nurses, to which should be attached in each case a warmed store for blankets and gowns. There should also be a waiting-room for friends of patients, where they put on a wrapper and cap before visiting the wards, as also a lavatory where they can wash before leaving the hospital. There should also be a small room properly fitted up for bacteriological examination in connection with the reception of patients. The warming and ventilation of the ward must be considered together as one operation. This subject must also be dealt with in close relation to climate. The key to the whole position is that for at least 300, if not 330, days in the year it is possible for us to open the windows of a hospital ward without danger or discomfort to the patient; and we must keep this fact prominently in view when dealing with the question of ventilation. In considering the warming and ventilation of a ward pavilion, it is essential to begin with the principle that the wards and their adjuncts (except, of course, the larder) should all be kept very much at the same temperature, in order to avoid draughts being caused by the opening of doors. His own experience was most strongly in favour of low-pressure water apparatus, the water circulating from a steam-heater placed in the basement of each ward pavilion. The wards, then, should be warmed (a) by open ventilating fireplaces, and (b) by the diffusion of fresh external air, warmed by passing over hot-water heating surfaces in the wards. Objections are urged against open fireplaces, on the ground that it is a wasteful means of producing heat; but he thought that this drawback is much more than compensated for by the cheerfulness of the open fire, and by the very important fact, too frequently overlooked, that an open fireplace, with a fairly good draught in the chimney, is about the best exhaust ventilator that can be found, and one that acts near the floor level. The cost per bed of a fever hospital is a subject upon which much definite information cannot very well be given, as the standard of hospital requirements has been considerably raised of late years, and is apparently still rising. One important element in this connection is the largely-increased accommodation provided for the hospital staff, as well as the largely-increasing proportion of nurses to patients.

MORE than half the world's supply of tin is mined in the Straits Settlement at the tip of the Malay Peninsula. The output in 1891 was 36,061 tons, out of a total of 56,651 tons; 12,106 tons came from the Dutch East Indies, chiefly from the Island of Banka, leaving only 8,384 tons for the rest of the world.

By a large majority, the Guardians of Leigh-Lancashire, have decided to erect new board, rooms and offices at a cost of £5,200, and new laundry, trampwards, &c., at a cost of £5,000. Messrs. Mangnall and Littlewoods, architects, Manchester, have been instructed to prepare plans and specifications. The board-rooms and offices are to be erected near to the workhouse at Leigh.

THE FIRST PERIOD OF ENGLISH ARCHITECTURE.

"ENGLISH Architecture of the Middle Ages," was the subject of a lecture delivered by Mr. Arnold Mitchell, F.R.I.B.A., in the Public Hall, West Norwood, last week. Mr. Mitchell confined himself to one period of the Middle Ages, the 12th century, as it was impossible to do justice to the whole ground covered by the term the "Middle Ages," and the 12th century was really the beginning or first period of English Architecture. Taking a *Cathedral* as an example of a *Gothic Church*, he endeavoured to point out some of the Architectural thoughts that would pass through one's mind on entering such a building. The first thing was the nave with two side aisles; it is noticeable that these aisles are separated from the nave by a row of arches. At first sight these might appear to have been built for the sake of effect, but this was not the case, they are absolutely necessary as a part of the construction of the Church. Considering for a moment the purpose for which a Church is built,—to hold a great many people—it is evident that a large floor-space is necessary, and this floor-space has to be covered by an equally large roof. Now, it is not convenient to have one roof, and at this period it would have been impossible to build such a roof, so the building was divided into avenues or aisles. The partitions between the avenues serve the purpose of supporting the roof. The next point is that these solid partitions are replaced by arches, which produce those beautiful effects of light and shade we so much admire; though their purpose is purely utilitarian. The great charm about a Gothic building is that its outward appearance truthfully represents its construction. Above this first row of arches rises a second, and sometimes a third, this is called a triforium. The most beautifully lighted building in the world is the Pantheon at Rome, which has no roof and is lighted from the top by a dome. With regard to the roof in Norman churches there is usually found an inner flat ceiling and an outer sloped roof. The reason for this is found in the construction of the arch. Where the arch springs from the pillar the stones which compose it are horizontal, but at the top of the arch they are vertical, and thus if they were not protected in some way the cement would be washed out and the arch destroyed. The superstructure of a church or cathedral is governed by the ground plan. Views were here shown of the plan and external appearance of Lincoln Cathedral and an explanation given of its construction. It is seen to consist of two parts, the nave and the transept crossing each other at right angles. It was always this point of juncture that the builders considered the most important, and they showed this, by erecting a tower on which they always lavished a great deal of care and skill. The nave is always divided into two parts, the nave proper, and the choir. It will be seen that the choir in our cathedrals always occupies a great deal of space, very nearly as much as the nave. This is because most of our cathedrals were originally monastic establishments, and the clergy were of as great importance as the congregation. The point the builders considered as only secondary in importance was the western front. This is nearly always adorned by two great towers, one on each side of the entrance, and occupying the width of the aisles. Now, whereas these towers are built directly on the ground, the tower in the centre is not so built, but is carried on four great piers, which uniting in the form of arches, one on each face of the tower, carry its weight. We here see the difficulties the builders had to contend with

in erecting a tower at this point. Part of the weight of this tower is very often carried by flying buttresses, which, though adding to the beauty of the design, were not originally intended for that purpose. In some instances the central tower gave way, as at Chester about twenty years ago, or has been left unfinished owing to the weakness of the foundations, as at Westminster Abbey, where it is only carried just beyond the roof. Lichfield is the only example in which the three towers are completed as they were intended to be. The square towers are finished off with beautiful spires. Having described the general construction of a Gothic church, the lecturer turned his attention to the minuter details of the interior. The construction consists of a succession of bays, carried from the floor up to the roof, the space between two pillars being called a bay. In the triforium there are two sub-arches in each bay, and the part just above these arches is occupied by a flat face of stone. It is very interesting to notice the gradual development of ornamentation on this surface. At first the builders left it plain, then they advanced to a lozenge-shaped pattern or simple designs. This was followed by piercing the surface with holes, the outcome being those beautiful results we see in the work of the next century. The first instance of the piercing of this space occurs in Peterborough Cathedral, and there is only one section so treated. The gradual growth of the capital was shown in the same manner, from the stage at which it merely served to mark the point from which the arch sprang to the time when it was finished off with elaborate carving. Norman churches always have a very substantial appearance, but it is a curious fact that the stones of which they are built are small. This is no doubt owing to their not cutting larger stones than a man could carry on his back. The lecture was illustrated by a number of beautiful photographs of many of the English cathedrals, which were shown on two screens, thus facilitating a comparison of different styles.

SOCIETY MEETINGS.

Leeds and Yorkshire Architectural Society.—Mr. J. T. Micklethwaite, F.S.A., delivered an interesting lecture to the members of the Leeds and Yorkshire Architectural Society, in their room, at the Mechanics' Institute, on "The Story of the Building of Westminster Abbey Church." Mr. E. T. Dodgshun (the president), in introducing Mr. Micklethwaite, said he was very well known in Leeds because of his connection with Kirkstall Abbey.—Mr. Micklethwaite remarked that when we had the story of the development of one of our great churches, it threw a great deal of light on other churches. These churches, as we saw them, were not deliberately designed structures, but grew naturally, like a tree out of the ground. Some of our older abbeys, like Ripon and York, go right back to the seventh century, and gradually grew and became the great churches that we saw now, and he wished to show them how that happened at Westminster Abbey. Westminster Abbey was a national monument. It only became that by accident. It happened to be next to the residence of the King, and became the place of the coronation of the Kings, and from the time of Henry III. onwards it was recognised as their place of burial. In the seventeenth century it began to be thought that burial in Westminster Abbey was the greatest honour that could be conferred upon a man after his death. That feeling grew up during the Commonwealth, and all the great men of the Commonwealth were buried there. The first Abbey was erected in the seventh century, but Bede, the great historian of the English Church at the time, did not mention it, though he mentioned York and Ripon, and we might take his silence as proof that in his time Westminster Abbey did not exist. In the eleventh century we get the fact that Edward the Confessor wished to build an Abbey close to his

house at Westminster, and there was an old Abbey there. We were not told how old it was, but he set to work to rebuild it. The lecturer then traced the progress of the Abbey buildings, illustrating his remarks by references to plans, and showing how they continued to grow until the sixteenth century, every step being a definite step in the history of the Abbey.—At the close of the lecture questions were invited, and a vote of thanks to the lecturer concluded the proceedings.

Society of Engineers.—At the meeting of this society, which was held at the Westminster Palace Hotel, on Monday, March 4th, a paper was read on "Parliamentary Procedure as affecting Light Railways and Tramways," by Messrs. W. Worby Beaumont and Stephen Sellon, of which the following is a synopsis: Engineering enterprise restricted by present parliamentary methods—Costs under present system—Harmful and costly delays caused by it—Public advantage endangered by opposition in the stages as at present conducted—Proposition and proof of public interest and utility should be heard first, opposition afterwards—Agreements made before date of standing orders should pass standing orders—Agreement before standing orders an absurdity with prayer form of petition—Abandonment of important schemes in consequence—Public loss and enhanced cost of transit—Clauses inserted at instigation of opposition without investigation by committee—Joint Committee, but independent decisions—Board of Trade and wider powers—Parliament to consider relation between proposed capital and reasonable cost—Restricted debentures no protection—Comparison of fares and rates with costs of promotion—Estimates—Light railways required in numerous districts—Extensive systems of light railways not asked for—Tramroads more important in most districts—Tramways wanted in many districts and all impossible under present procedure and restrictions—The Board of Trade Committee on Light Railways and its report.

York Architectural Society.—Mr. J. W. Longfield, of the Art Metal Works, Otley, read a paper on Wrought-iron Work at the meeting of this society, held at the Church Institute. Mr. A. Mollard, in the chair. The lecturer stated that no material was more worthy of study than wrought iron, for although it was the cheapest of metals, yet it surpassed all others in interest and in its utility to us. The discovery of immensely rich ores of iron in almost every part of the world, and of fuel fit to reduce them, had already inaugurated a period of decline in the production of iron ore in this country, and should lead us to prepare for the inevitable change from the raw produce mart to the art-produce mart of the world, which must ensue if we were to maintain our trading supremacy in the future. The recent movement in favour of the adoption of wrought-iron work for architectural and domestic purposes in preference to the hard geometric productions of the foundry had caused one to wonder why this beautiful art had become superseded by cast-iron. He was afraid that cheapness, as in a great many other things, was responsible for it. A peep inside our old cathedrals, such as York Minster, amply demonstrated the love of our forefathers for the beautiful examples of the smith's art which were now coming to the front again. If forges superintended by experienced smiths could be erected in our technical schools, he was sure that many young men would learn the craft, and not only improve their means, but produce a supply of mechanics which was really becoming needed. In accuracy and finish the English workman was all that could be desired, but when they looked for taste, idea or originality, he was most disappointing. Furthermore, it was often next to an impossibility for a smith to execute the designs of many architects except at a great cost, whereas a similar effect might easily be obtained if the architect had a slight knowledge of the material in which the design had to be made. In conclusion, Mr. Longfield urged that if architects and those engaged in the building trades were to apply themselves more fully to the study of the craft, wrought-iron work as an art would make greater strides in the future than it had ever done in the past.

The Carlisle Architectural Engineering and Surveying Society.—Mr. W. Pogson, read a paper on "Iron Roofs," at the meeting of this society held on the 21st ulto. The lecturer dealt at some length upon the advantages of iron over other materials for roofing purposes, on account of its strength, relative weight and durability. He also went into the question of live and dead loads, and stated that, in his opinion, an allowance of from 40 lbs. to 50 lbs. live load per square foot for wind pressure, was sufficient in Great Britain. A number of diagrams were introduced.

Glasgow Institute of Architects.—The Council of this Institute held a special meeting in the chambers of Messrs. MacLean, Fyfe and MacLean, on the 25th ulto. The President occupied the chair, and the Secretary read letters from Sir Frederick Leighton, P.R.A., Mr. R. Norman Shaw, R.A., Sir George Reid, P.R.S.A., and other gentlemen, notifying their acceptance of the honorary membership which the Institute had conferred upon them.

JEAN FRANCOIS MILLET.

The Peasant Painter of Barbizon.

By ARTHUR O'NEILL.

Continued from page 44.

THE Salon is everything to the ordinary French Artist, although he may affect to despise or disdain it. Millet obeyed the instincts of the mass of his brotherhood. He sends to the Salon, although to him it is a torture chamber. He finds himself torn between the indifference or stupid surprise of the public, and the fury or the sympathy of the people who pretend to criticise his masterful works. In the fulness of his magnificent nature he has little sympathy with the official exhibition, and yet he uses it. It was a mockery, if you like; but it meant bacon and beans to the increasing family at Barbizon. As he acknowledged, in a pitiful letter, he found his pictures out of their element, and lost in a world which did not speak the same language. The new painting only raised a feeling of curiosity in him, and he said to a friend, "I wish I could make Artists paint with more meditation, and critics write with less sufficiency. I would like the Salon closed for five years, and at the end of that time each Artist be allowed only to send one nude figure, which would have no meaning. You would then see how many clever fellows would withdraw from competitions, and how much want of knowledge is our modern disease."

We revert now to 1862, the year in which the master felt himself ripe for his boldest ventures. After having proceeded with a certain amount of caution hitherto, he then showed to the world a mass of invention, a series of unexpected works in a form that no Artist before him had used. In this year 1862 he painted "Winter" and "The Crows," "Sheep-feeding," "The Woolcarder," "The Stag," "The Birth of the Calf," "The Shepherdess," and the "Man Resting on the Hoe," which raised such a hue and cry with nervous critics. If the series of works made during this important year were brought together, it would be said that their author must have elaborated them in the most quiet spirit. They all are the wholesome, robust offspring of Millet's genius, despite his sad and, one might say, overwhelming troubles.

Not yet had peace come for him. He was destined never to have rest except in that "place of refreshment" which he foresaw as the end of all his struggles. How could he find rest for a mind which was charged with the making of a revelation to a new generation? Here was the distressing crowd of creditors, pestering him, as they had pestered his friend Rousseau. No man, of course, ought to have creditors. That is a good old aphorism of prudential philosophy. It is an axiom which genius forgets to put into practice; it involves a problem which neither a fitful nor a purposeful genius can readily set himself to solve. Lonely, but anything rather than lifeless, he clambered along the steps of the endless ladder and wrought his life-work, unabashed by the

tribulations which came to him, and bearing upon his honest soul the consciousness that the power in him would survive him, and that a world to come would class him higher than his contemporaries would value his name as one of fame, and busy themselves in the time to follow, by exalting him as famous above his best renowned compeers. And the Artist, it is said, does not appreciate his critics. Do not ask me to believe such heresy. Is it possible that among my hearers there are some who are familiar with Mr. R. H. Horne's "Orion," an instructive parable on "A Single Object and a Hundred Eyesights." It is the solvent of manifold mysteries, and the key to all artistic criticism. You must try to see with the Artist's eye, before you dare to profane with random words the Artist's bright productions. It is true, perhaps, that one needs to be something of an Artist himself to be sufficiently susceptible to the beauty of an artists' handicraft. Even in the midst of his torments and his efforts, Millet found a sympathetic critic in Monsieur Pelloquet, to whom he made the gracious response, which at once discloses his opinions on Art and the virility of his mind. "Monsieur," he writes from Barbizon, "I am very much pleased at the manner in which you speak of my pictures at the Exhibition. The pleasure is especially great because of your manner of speaking of Art in general. You belong to the very small number of persons who believe (also for those who do not believe it) that an art is a language, and that a language is made to express thoughts. Say it, and say it over again! Perhaps it will make some one reflect. If more people believed it, we would not see so much aimless writing and painting. It is called skilful, and those who make a business of it are greatly praised. But truly, and if, in fact, it is real skill, should it not be employed only to accomplish good work, and then hide itself modestly behind the work? It would be very absurd if the wrist took precedence of the brain. I do not remember, word for word, what Poussin says in one of his letters about the trembling of his hand, at a time when his head was in good working order, but this is about the gist of it. And, although it (the hand) is weak, yet it must still be the servant of the greater power. Once more, if more people believed as you do, they would not so resolutely devote themselves to flattering bad-taste and evil passions for their own profit and without care for right; as Montaigne says so well, instead of naturalising art they artificialise nature."

"I will tell you some things which are to me matters of faith, and which I would like to express in my work. That things should not look as if they were brought together by accident and for the moment, but that they should have among each other an innate and necessary connection. I want the people I paint to look as if they were dedicated to their situation—that it would be impossible for them to ever think of being anything but what they are. A work should be all of a piece, and people and things should be there for an end. I wish to put strongly and fully all that is necessary, so much so that I think things weakly said had better not be said at all, because they are, in a manner, deflowered and spoiled; but I profess the greatest honour of uselessness (however brilliant) and filling up. Such things can have no result but to take off the attention and weaken the whole."

"It is not so much the objects represented as the desire of the artist to represent them, and this desire creates the degree of power with which he has executed his work. One can say that everything is beautiful in its own time and place; and, on the other hand, that nothing is beautiful which comes at the wrong time."

"Let us have no weakening of character; let Apollo be Apollo, and Socrates be Socrates. Do not combine the two—they would both lose by it. Which is the handsomer, a straight tree or a crooked tree? The one that is in its place. I therefore conclude that the beautiful is the suitable."

"This might be infinitely developed and proved by endless examples. Understand that I do not speak of absolute beauty, for I do not know what it is, and it seems to me only a tremendous joke. I think people who think and talk about it do so because they have no eyes for natural objects; they are stultified in 'finished art,'

and think nature not rich enough to furnish all needs. Good people they poetize instead of being poets. Characterize! that is the object. Vasari says that Baccio Blandinelli made a figure to represent Eve, but getting further in his work, he found that his figure was a little thin in the flank for an Eve. He simply gave her the attributes of Ceres, and the Eve became a Ceres. We may admit that, as Blandinelli was a clever man, there must have been some bits of superb modelling in the figure, and great knowledge, but nevertheless it had no determined character and was a most miserable work. It was neither fish nor flesh."

To be Concluded.

PROFESSIONAL DIGNITY.

WE return to our charge; we accuse the Editor of our Catherine Street contemporary of a flagrant disregard of good manners; we are convinced—on his own showing—he knows little of journalistic etiquette. We have no objection to a legitimate sling and stone, but we detest mud. We are not going to throw mud, but we have no objection to a fair and honest volley in decent warfare. It shall be a volley all round. We applied to the Editor of our contemporary—he posing not as Editor but in professional capacity, and under his own name, as an authority on a particular branch of architecture—for the pleasure of his paper. Our letter was couched civilly enough; we wrote as we should have written to the ablest member of the architectural body. We are not likely to minimise the importance of his remarks. There is no need. This lecturer's worst enemy is himself. We received in reply, a letter almost incoherent in its abuse and impertinent in its refusal. We were threatened with an injunction. Forsooth, the matter might have been of moment yet Architecture would not languish if this authority for ever held his tongue. But we respected our contemporary's Editor—with difficulty. We did not publish his paper. Architecture has survived. But, as if this Tartar rudeness were not enough, our opponent reveals his batteries and lays bare a jealous hatred of ourselves. We are sorry, but this man's hatred need not disturb Olympus. In the columns of our contemporary, there has been made a charge which we deny. Our opponent accused us of pilfering his editorial columns. It is absolutely and entirely untrue. We assure him, in the best of good-humour, that we find him too dull. What we *did* do was to "lift" a portion of Professor Aitchison's lecture to the students of the Royal Academy, and a *resumé* of the papers read at the Institute. The moment we were made aware that our contemporary had monopolized Professor Aitchison—though we hold such monopoly wrong in the true interests of Architecture, and hope soon to be able to destroy it—we expressed our regret. We are of opinion still that the Professor's able papers should be free to all. The *resumé* of the Institute proceedings was journalistically "liftable" matter. In the same sense our contemporary "lifts" reports of architectural meetings in the provinces, an instance of which occurs in its current issue. Our contemporary's conscience is as dull as its pages. If we have brightened either we are satisfied.

MR. FENWICK, as arbitrator, has awarded a Mr. Miles £10,244 for land taken under compulsory powers by the Great Western Railway Company for the extension of their Avonmouth Docks. The expert valuations handed in on behalf of the claimant were about £18,000, while those for the Railway Company ranged from £6,000 to £8,000.

THE Sheffield School Board proposes to erect a new school for the deaf and dumb.

ARCHITECTURAL IRONWORK: CONSTRUCTIVE AND DECORATIVE.

A Series of Instructive Papers for the
Artist and Worker.

CHAPTER II. COLUMNS.

THE vertical or perpendicular constructive iron members employed in architecture are columns or pillars, and stanchions or storey posts. The former are generally of circular section of considerable area, and are usually employed in ground

Figure 1

floors, one of the best for use being shown at Figure 1. This description of stanchion is likewise frequently employed in lieu of cast-iron columns, as the flanges which divide it lengthwise into three equal parts, have been found to add considerably to the strength of the casting, in resisting the tendency to produce deflection from the vertical position. It has been proved that, while cast-iron pillars are best when the length does not exceed twenty-six times its diameter, wrought-iron columns or stanchions are better for any exceeding that length. For pillars with hinged ends, about thirteen times is the limit, these results being roughly approximate only. In order to stiffen wrought-iron struts they are made of various forms in cross section, such as single iron, T iron, double T iron, channel iron, &c. The cross is a very convenient form, as in cast-iron girders and other portions of structural iron-work, it is generally built by rivetting bars of simple forms together. Thus it may be made of T irons rivetted back to back, or four angle irons similarly rivetted, or by one flat bar, two narrower flat bars, and four angle irons, all rivetted together, as shown at Figure 2. The stiffest form for a wrought-iron strut, is that of a cell or built tube, which may be cylindrical, rectangular, or triangular. Cast-iron, from its great resistance to crushing, is particularly well suited for struts, especially if of a moderate length, the best form being that of a hollow cylinder, wherein the thickness of metal is not less than one-twelfth that of the diameter.

Figure 2.

Formerly, stanchions in storey posts were used like their predecessor, the wooden puncheon, in upper storeys of edifices, although now very frequently substituted for columns in lower ones. Both columns and stanchions are constructed of cast-iron, for it

Figure 3.

does not appear that any attempt has been made in Europe to forge pillars of considerable dimensions and great weight like the Lhât of Delhi. Not being subjected to any severe tensile strain, but merely to a crushing stress acting in the direction of the column's length, cast metal is really the best for these members as given an equal quantity of metal, a round column, cast hollow, is far stronger than one cast solid, the best form being to make the inner diameter five-eighths of the size of the exterior diameter. The ring thus formed of the section of the column increases in strength according to the thinness, but

the size of it must be kept within practical limits. If in casting a hollow column, the core is driven to one side, the column, of course, cannot be loaded to its full resistance; it will not carry more than the thinnest part if it is strong enough to bear.

Figure 4

Hollow columns, therefore, require particular care in casting. Columns are cast either in what is technically called green sand (or selected sand, somewhat moistened), or loam. For this purpose it is necessary that the iron founder prepares a wooden model (a pattern, as it is technically termed), exactly resembling the column which he desires to produce in iron. This is then embedded in the strata of sand or loam, held in a couple of iron frames, called "flasks" or boxes. The wooden pattern is then taken out, leaving a vacancy exactly like itself in the sand. Of course, when the molten iron is poured into this mould, it assumes the form of the cavity, and when the casting is cool and taken out, it is an iron column, which is a *fac simile* of the wooden pattern. When the column is to be cast hollow, which is often the case, especially with large work, the mould requires to be, what is technically termed cored, that is to say, a small roll or cylinder of sand or loam is placed along the vacancy in the mould, so that the molten iron flows all around it. When this sand "core" is afterwards cleaned out of the interior of the casting, of course it leaves the column hollow. Columns are usually cast quite plain, sometimes all the same size throughout their length, and sometimes with a slight taper or diminution towards the upper end. When the column will be *in situ* and seen, and it is desired to impart somewhat of a decorative appearance to it, it is frequently "fluted" or grooved with channels in the direction of its length, and has a more or less ornamental capital, instead of a plain cap. This involves more trouble in the production in the foundry. The surface in the pattern has also to be fluted, and in order to ensure the mould being perfect, "false cores" have to be placed at the flutes which come where the parting of the mould is. A, in Figure 3, is the upper flask or box, with its contained stratum or layer of sand, seen in section; B is the lower box and its contained sand; C is the parting or line where the two strata of sand come into contact; D is the column; and EE are the false cores. Various other ornamental designs are used for special situations, as, for example, to support the roofs of platforms of railway stations. It may here be mentioned that it is believed fluted columns owe their origin to the fact that the flutes were cut to enable the Roman soldiery to rest their spears outside while they went inside their temples to worship.

A

B

Figure 6.

The cores of hollow columns have to be made in one piece in length, the castings

made of a uniform thickness of metal, straight, and reasonably perfect, the ends being turned off true in a lathe. The somewhat common practice of casting columns with a greater thickness at the end, where it is observable, than at any other part, should be discontinued. The risk that is thereby assumed is greater to the founder than the value of the metal saved warrants, especially in these days of cheap iron and steel. It is usual, as I have remarked, to make round columns a little smaller at the upper end than at the middle, as this is considered advantageous in stability, as well as improving the appearance. The difference, however, should not exceed one-tenth of the diameter. More rarely, a slight taper is given from the base to the cap, as in stone columns in masonry. For columns, good strong iron or mild steel should be used, and care taken in the founding. It is seldom that columns are cast perfectly straight, the cooling and contraction being unequal; but a minute deflection does not matter, though any fundamentally defective columns should not be used. Of late years steel has taken the place of iron in all constructive elements, nearly every section of beams, pillars, stanchions or joists being now made in steel, including cylindrical and octangular columns, steel being the more useful when weight and bulk are a consideration, to be deposited in turn, in all probability, by aluminium in the not very distant future. Mild steel is generally used, this containing 0.18 per cent. of carbon, and bearing a tensile stress of from 30 to 35 tons per square inch with the fibre, and from 28 to 30 tons across the fibre, much higher results being obtained for special purposes.

Figure 7.

With regard to the load which hollow cylindrical columns will sustain with safety, the following table, by Mr. W. J. Fryer, jun., will be found useful. A safe load may be estimated at one-fifth the breaking weight. The following table therefore gives the safe load in tons. The columns are supposed to be turned off true at right angles to their axis in the lathe; level caps and base plates used, and the columns set up with reasonable care in the building. For columns not turned, one-half these amounts should be taken for a safe load. In estimating the load to be borne by a column, allowance must be made for any use the building may be put to, and the greatest weight that may come on any one column. Besides an allowance for the floors and the weight to be placed thereon, one-fourth of the total should be allowed in addition, to make assurance doubly sure. Great allowance must be made for columns that are subject to any vibrations caused by machinery, especially machinery in intermittent action, such as drilling and stamping machines, cutting machines used in printing offices, and heavy machinery which is not equally disposed on its base; by railway trains, or under the floors of drill rooms or assembly halls, or when subject to concussion from bodies falling on a floor above, or

made of a uniform thickness of metal, straight, and reasonably perfect, the ends being turned off true in a lathe. The somewhat common practice of casting columns with a greater thickness at the end, where it is observable, than at any other part, should be discontinued. The risk that is thereby assumed is greater to the founder than the value of the metal saved warrants, especially in these days of cheap iron and steel. It is usual, as I have remarked, to make round columns a little smaller at the upper end than at the middle, as this is considered advantageous in stability, as well as improving the appearance. The difference, however, should not exceed one-tenth of the diameter. More rarely, a slight taper is given from the base to the cap, as in stone columns in masonry. STATISTICS from Birmingham strikingly indicate the cost entailed by the severe frost there. It is estimated that out-door workers lost £50,000 in wages, and that £10,000 was spent in relief. Two thousand water-pipes burst, entailing, with fractures of gas-pipes, a cost of £1,000 every day. The water department sent round water carts at a cost of £100.

THE Urban District Council of Bishop Stortford has received the formal sanction of the Local Government Board for the raising of a loan of £3,142 for extensions at the water-works. The Council have considered Mr. Mansergh's report on the sewage, which stated that the Council must double its pumping powers at a capital outlay of £2,000. The subject was adjourned for Mr. Ingold and the Surveyor to bring it forward in a more complete form.

THE *Aluminium World* gives a table showing the quantity, price, and total value of manufactured aluminium for each year from 1884 to 1893. It is as follows as regards quantity turned out. In 1884 there were only 150 lb., in 1885 there were 283 lb., in 1886 there was a leap to 3,000 lb. During these three years the price remained steady. In 1887 it dropped to about a third, and the output increased to 18,000 lb. In 1888 it was 19,000 lb., and in 1889, when there was another fall in price, the quantity manufactured had risen to 47,468 lb. In 1890 it was 61,281 lb., and in 1891, with a further considerable reduction in price, the output mounted to 150,000 lb. In 1892 it was 259,885 lb., which had risen to 339,629 lb. in 1893.

MR. WALTER SCOTT, of Newcastle, has purchased a portion of the Whitley Park Estate, and plans for the formation of several new streets have been prepared by Mr. Wm. Glover, architect, 16, Market Street, Newcastle, and have been approved and passed by the local authority. The plans provide for 154 houses.

Correspondence.

The Editor welcomes Correspondence on matters of general interest. Gentlemen thus addressing the Editor should condense their communications as much as possible.

To the Editor of "THE BUILDERS' JOURNAL."
"PIERLESS' BRIDGES."

13, Southampton Street, Strand,
March 4th.

SIR,—In asking you to permit me to congratulate you upon the excellence of your literary matter—its sprightliness, its usefulness, and upon the general beauty of your illustrations, may I add that there is one weakness which I have detected in your work, and that is, you are deficient in a due and proper sense of *proportion*. For example, a Fellow of the Royal Institute of British Architects who has hitherto withstood the temptation to favour the World with a few triumphs of Architectural Art, and who has, at No. 9, Conduit Street, put Phidias right upon a little question connected with the sculpture of the Parthenon, selects for a paper to be read before the Architectural Association the all-absorbing subject of Bridges—structures which are solely and purely the work of the Architect; upon which almost every practising Architect is at this moment engaged, hundreds of bridges being thrown across the Thames every year!

You, Sir, and your professional contemporaries, are invited to sit and listen, and what do you all do? You stay away, and do not even reproduce the paper which you could have had for the asking, and for which your subscribers were clamouring. Not that the writer of the paper cares—he is very glad you did not go—he says so himself, in one of those little paragraphs so dear to him—in fact, he would not have known you were absent only some one told him, and he certainly will not invite you again—so there!

The next time the Editor in question becomes a lecturer, please attend in your official robes, and let us have no more of these conspiracies to keep from an anxious World reports of papers of so momentous a character as that on "Bridges," by a writer who has never built one.—I am, Sir, yours faithfully,

WM. WOODWARD.

[Mr. Woodward is in satirical mood. We have tempered his sentences with a little editorial milk and mercy. Bridges have their uses, and so, too, have lecturers. We are always glad to do justice to the authority in question. We might just point out that we were frankly and fairly wishful to publish the paper on "Bridges." We applied for it. We were met by gruffness, some interjections, and a little joke above an injunction. Still our ardour is undaunted, and we may even bridge over this difficulty. We shall always report the editor of our fourpenny contemporary, when we think his remarks sufficiently grotesque or—important. We will even quote the paper: *The Builder*. There! The heavens are not fallen and the Law Courts are undisturbed.—ED. BUILDERS' JOURNAL.]

THE vicar and churchwardens of Oldham have started a scheme for the restoration of the parish church. The present building, replacing one which was restored in the fifteenth century, was built by special Act of Parliament in 1830, to seat 1,700. It is proposed to raise £1,200 for partial reseating, the rehanging of the peal of bells, and renewal of organ, which is literally falling to pieces in its case. The whole scheme will require, in addition, £3,000 for chancel and £1,500 for chapel and vestries, in order to complete the church as designed in the original plans of Sir Charles Barry.

Trade and Commerce.

We shall be glad to receive copies of catalogues from firms engaged in the allied building trades. These will be carefully looked through, any novelty noted, and—should its nature seem to demand it—fuller attention drawn thereto. We are particularly wishful to secure the friendly interest of designers and artificers in *THE BUILDERS' JOURNAL*, and, now and then, we might see our way to reproduce an outline sketch or illustration of any contrivance that struck us as being new or needed. Building covers up—figuratively, and in fact—so much ground, and we mean to cover the whole of it.

We should be further obliged if firms would indicate, by some suitable mark, the pages in their catalogues to which they would, in particular, desire to call our attention.

"MARPEDO,"

The New Sanitary Washable Water Paint.

VARNISHABLE WITHOUT SIZE. SUBSTITUTE FOR OIL PAINT AND DISTEMPER.

IMPERISHABLE, DAMP-PROOF, and ODOURLESS. WILL NOT CRACK OR BLISTER.

More Durable, and 60 per cent. Cheaper than Oil Paint.

MAY BE APPLIED (Inside and Outside) TO BUILDING, WOOD, IRON AND PAPER.

MARPEDO PETRIFYING LIQUIDS FOR DAMP WALLS. MARPEDO COMBINATION VARNISH STAINS.

THE "MARPEDO" COMPOUND COMPANY, READING ENGLAND.

TO BUILDERS and CONTRACTORS.

The London County Council is prepared to receive TENDERS for the ENLARGEMENT and ALTERATION of the FIRE ENGINE STATION in Farringdon Road, Clerkenwell.

Persons wishing to tender may, on applying to the Architect's Department, Fire Brigade Branch, 21, Whitehall Place, S.W., and on depositing the sum of £10 in cash, obtain forms of tender and contract with the bills of quantities, and may also inspect the drawings of the proposed work.

The amount deposited will, after the Council has come to a decision upon the tenders received, but not before, be returned to the tenderer, provided he shall have sent in a bona-fide tender, and not have withdrawn the same.

Tenders must be delivered at the County Hall in Spring Gardens not later than TEN a.m. on MARCH 19, 1895, and no tender will be received after that time.

Any tender not made on the provided form, or which has been altered, or is not filled up and complete in every particular, will be rejected.

The Council does not bind itself to accept the lowest or any tender.

The contractor will be bound by the contract to pay to all workmen employed by him the London Trades' Union rates of wages, and to observe the hours of labour and conditions recognised as fair by the London Trade Unions at the date of the delivery of the tender, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

H. DE LA HOOKE, Clerk of the Council.
Spring Gardens, S.W., February 20, 1895.

BOROUGH of SOUTHEND-ON-SEA. SANATORIUM BUILDINGS.

Builders desirous of Tendering for the ERECTION of one PAVILION, ADMINISTRATIVE BLOCK and OUT-BUILDINGS, are requested to send their names to the Architect, Mr W. Y. HOBBISS, Clarence-road, Southend, not later than MONDAY, the 4th MARCH.

Plans and specifications may be seen, and bills of quantities

obtained (on payment of £1 is. which will be returned on receipt of a bona-fide Tender) on application to Mr. W. Y. HOBBISS, on and after MONDAY, the 11th MARCH.

The Corporation invite TENDERS for the above WORKS, and the same sealed and marked "Tender, Sanatorium Buildings," may be delivered at my Office not later than FRIDAY, the 22nd MARCH at FIVE o'clock p.m.

The Corporation do not bind themselves to accept the lowest or any Tender. By Order,
Southend-on-Sea, WILLIAM GREGGON,
February, 29th, 1895. Town Clerk.

PARISH of ST. GEORGE-IN-THE EAST. TO BUILDERS.

The Guardians of the Poor of the above parish hereby invite TENDERS for PAINTING, REPAIRS, and sundry other Works at the Workhouse and Infirmary, Raine-street, Old Gravel-lane, E.

The Draft contract and specification may be inspected on and after FRIDAY, the 29th instant, at the Offices of the Architects, Messrs. WILSON, SON and ALDWICKLE, at the Vestry Hall, Cable-street, E., between the hours of TEN and FIVE.

The Form of Tender and the bills of quantities will be supplied upon payment of two guineas, which amount will be returned to persons sending in bona-fide Tenders.

Tenders, which will only be received upon the printed form, endorsed "Tender for Painting and Repairs at the Workhouse and Infirmary," and accompanied by the priced bills of quantities, are to be delivered at the Guardians' Offices not later than TWO o'clock in the afternoon of FRIDAY, the 8th MARCH next, and will be opened at a Board meeting at FOUR p.m. on that day, when parties tendering, or their authorised representatives, must be in attendance.

The Guardians do not bind themselves to accept the lowest or any Tender, nor will they pay any expenses incurred in preparing the estimates. By Order,

Guardians' Offices, J. R. BROWNE,
Raine-street, Old Gravel-lane, E. Clerk to the Guardians.
February 25th, 1895.

COMPETITIONS.

COUNTY BOROUGH OF WEST HAM. COMPETITION.

The Council of the County Borough of West Ham propose to ERECT a TECHNICAL INSTITUTE and PUBLIC LIBRARY in Romford Road, and they hereby invite Architects to submit DESIGNS for the same in competition.

Premiums of £250, £150 and £100 respectively will be paid to the Authors of the Designs which are placed by the Assessor first, second, and third in point of merit.

The Competitor to whom the first premium of £250 may be awarded will be employed as Architect, and will be remunerated in accordance with the schedule of professional practice and charges of architects, published by the Royal Institute of British Architects, such remuneration being independent of the premium.

The Council have appointed Mr. J. MACVICAR ANDERSON, F.R.I.B.A., 6, Stratton Street, Westminster, W., as their Assessor and Professional Adviser.

Designs are to be delivered at the Town Hall, West Ham, E., not later than FOUR p.m., on WEDNESDAY, 1st May, 1895.

Full particulars of the instructions and conditions can be obtained on application to the undersigned, on payment of a deposit of One Guinea, which will be returned in the event of the applicant either submitting a Design, or returning the instructions within one month from the date of receiving them.

By order of the Council,

Town Hall, West Ham, FRED. E. HILLEARY,
January 21st, 1895. Town Clerk.

IPSWICH.—MARCH 23.

DESIGNS are invited for the Building of a WORKHOUSE and INFIRMARY, with Specifications and Estimate. Premiums £100 and £50. My. A. F. VULLIAMY, Clerk to the Guardians.

The Builders' Journal.

Theatres and Fire. FIFTEEN years ago, the Glasgow Theatre Royal was erected by Mr. Phipps, on the site of a theatre which had been burned to the ground, and now that building is in ruins. It was, naturally, of fireproof construction. It would not burn, it was not made to burn, there was nothing in it that could burn; but it is in ruins. The fact, plain and unvarnished, carries out our conviction, that good planning—good entrances and exits, good staircases, good passages and easy gradients—is worth all the fireproof constructions in the world. We commissioned our artist to visit the ruins and bring us sketches, and from these and his report, many funny things appear to have happened. The concrete corridors and landings, built *in situ* on centrings, have been demolished. Mr. Potter tells us authoritatively that these floors are apt to give way in houses during a fire, because the portion of concrete below the neutral axis is undergoing a tensile strain, and hangs as a dead weight to the portion under compression. The startling unreliability of the corridors has “amazed” the Glasgow fire brigade officials, who, perhaps, know very little about the matter. The iron columns supporting the tiers appear to have held out very well, for they remain—although twisted somewhat badly—in upright positions. The whole of the auditorium as well as the stage was utterly destroyed, and once more the myths of fireproof construction of theatres are exposed. Mr. Phipps is commissioned to rebuild the house, and is already at work. He will, undoubtedly, try something better than concrete slabs for his corridors this time.

Measure for Measure. In a very interesting book, recently published, the author, Mr. Donisthorpe, is inquisitive about the yard. He has puzzled himself with the weight and measure standards of the Aryan races; what was the original yard? We should be entertained if any of our readers, be they architects or builders, would send us the result of any individual research upon this point. The architect can be as theoretic as he pleases, and the builder can measure up with his two-foot or by rule-of-thumb, but how did the yard spring into being? Was it the length of a man's arm, or the truncheon of arboreal man, or the width of his stride? We can fancy a man's arm had more weight among the Aryans, if not more inches. Both

hypotheses are probable. If we argue by evolution, we find that man's arm has shortened, the ape now having the advantage. Unquestionably, the early races used their arms more than we do, in the active, vigorous senses. They climbed trees and wrestled with animals; the “flint head” came in a day of comparative clumsy science. Then there were the tree-roots that Thor and his men used for walking-sticks, of capacious measure and problematical strength. These would be rough and ready measures. Finally, there was the stride of a man that cast a shadow on the ground. Mr. Donisthorpe seems to think the yard-standard was

SOUTH DOOR: ROCHESTER CATHEDRAL.

taken from the arm of Henry I., lasting down to our own time. If this be so, Henry First's arm achieved a more important glory than ever it won in battle. The yard-measure is mightier than the sword or pen, if we strike the balance in money. Think of what the yard has done! It has, with its attendant feet, trod mountains and mapped out countries; it has estimated the deep seas; it has doled out pretty ribbons to the pretty ladies of many centuries; it has been the builder's best guide and the architect's first friend; it has given men decent fitting clothes; it has been liberal to women in “white samite”

and fine garments. Surely, then, the yard has more sentiment than on the surface you would imagine. Prior to the ready arm of Henry I. people had careless, inconvenient ways, dealing by the handful, the needle-length (progenitor of the nail), the day's ploughing, the bovat: as much land as a certain number of oxen could plough in a year, and so forth. We read that the American Indians had a Dutchman's boot as commercial criterion, substantial enough, but slight withal. There is another fact of interest; the portly Romar was not quite so aldermanic as ourselves, while the classic Greek was a trifle bulkier. This should make the Shade of Homer shudder. We pass on in Mr. Donisthorpe's delightful work to the furlong, or furrow long. The furlong was as much as a plough, oxen-drawn, could do at a burst, and a little mediæval measurement soon proved that this was about forty times the length of the plough-pole. The average ox might differ upon the question of work and furlongs, in this, resembling all men, but that the furrow-long was a standard of strength is obvious upon the face of things, and standard of strength became, gradually, standard of measure. Then, again, the acre was a day's ploughing; square measure did not trouble the hardy Saxon, and he was happy, while the rood—the road—was the quarter of the area left unploughed for the carts to come by. The foot and mile were Roman importations, and, pray note, ye measurers by English mile, that the mile was originally a thousand paces, but was made to march to the tune of eight serious and hearty furlongs. Goth, Greek and Roman, Assyrian, Egyptian, Babylonian, had their primitive measures—stride, or oxen's strength or cubit. But the half-cubit—even in Mr. Donisthorpe's book—is beyond us: “One thousandth part of the length of a second upon a meridian multiplied by fifteen gives an old cubit or half-yard.” We are a little hazy here, but still have faith to walk. Now the yard is established, and each one is busy measuring his land or his neighbour.

An Unhappy Business. THE Cardiff controversy seems to us an unhappy business. In the interests of the profession it ought to be speedily brought to an issue and closed. The local Press is full of the hubbub, and Mr. Bruce-Vaughan and Mr. Seward are firing at each other on alternate days. It is all very disagreeable—and regrettable. Mr. Edwin Seward, formerly President of the Cardiff Architect's Society, is—as we pointed out last week—in a painful position. Into the right or wrong of the

dispute it is difficult to enter—at this distance. But the cleavage seems to be growing more and more acute, and the longer the affair lasts the more difficult it will be to restore harmony and good feeling. Mr. Seward still declines to meet the Society or to discuss his business affairs with those “who are concerned in an attempt to deprive me of an honourably acquired engagement.” Mr. Seward is “willing to await the issue of that just and right consideration which the authorities will certainly extend towards one who has acted diligently for them in respect to the Cardiff Museum and Art Gallery.” It will be remembered that Mr. Seward claims to be the properly appointed architect—by Corporate resolution—of the new museum and art gallery, for which a site has been obtained elsewhere than originally intended. The Museum Committee contend that, not having met, they could not have appointed an architect, although it is admitted that Mr. Seward has acted in an “honorary capacity,” and that he was commissioned in 1890 by the Cardiff Corporation to prepare plans for the extension of the Free Library, Museum and Art Gallery. That resolution, not having been rescinded, would seem to us to hold good, notwithstanding that, latterly, it has been decided to remove the Museum and Art Gallery to another site. The Library is being completed, we take it, from Mr. Seward's original design. There must be something underneath the surface of all this, and we should like to see the matter bottomed. Why the Architects' Society, aware of the original resolution, should have memorialised the Corporation to throw the final portion of the scheme open to competition at this late hour we cannot imagine. To the best of our intuitive common sense the whole quarrel would seem to rest on the question whether the scheme of 1890 was one homogeneous scheme, or a patchwork of three ideas, and liable at any time to be decentralised or split up so long that the buildings, or any portion thereof, remained to be built. Mr. Bruce-Vaughan, the present President, is as emphatic as Mr. Seward. He repudiates as “a base, unworthy and groundless charge” Mr. Seward's assertion that the Society had influenced the Corporation to deprive him of the work. Mr. Vaughan says he is open to be convinced of Mr. Seward's “moral and legal right” to act in his claimed capacity, but, meanwhile, Mr. Seward will not meet the Society. We would suggest that an architect of acknowledged eminence be called in to arbitrate. It is a painful quarrel as it stands.

Face to Face.

EVERY evening paper in London devoted the whole of its Contents Bills to the startling head lines of the horrible domestic tragedy that shocked the inhabitants of Lower Tooting in the early hours of Thursday morning last. But not one of these evening papers sought to point a moral from the simple lesson the tragedy appears to offer. Frank Taylor was a plasterer, an honest, clean, industrious and sober man, out of work unfortunately through the recent spell of hard frosty weather. Taylor had a wife and seven children, the eldest of whom was fourteen years of age. The wretched man, fronting the pangs of poverty, and perhaps of insufficient food, drew a razor across his wife's throat and then methodically murdered six out of his seven little ones by the same weapon, and finally killed himself. The eldest son, who will recover from his injuries, gives the dramatic details of the tragedy. London has nearly forgotten the whole messy affair, although it is not often that such a wholesale slaughter excites the commercial interests of its journalists. The point is a very simple one, and we distinguish it entirely from all faithless expressions of horror which satisfy the emotional susceptibilities of

thoughtless persons. By what moral right, we ask, did Frank Taylor possess himself of seven children? Perhaps the same question presented itself to the wretched man on the night preceding the affair, and not being able to answer it satisfactorily, he met the case in a bold and maddened fashion, and destroyed what he had been the means of creating. We spent a recent holiday in the workshops of a country builder, giving scope to our pretty turn for joinery, and laying in a stock of brain energy by exercising our body by sheer hard physical work. We wheedled out the history of the men who worked at our side, and, with a single exception, they were the parents of from five to eleven children, and not one of them averaged a weekly earning of more than thirty-two shillings a week, some as low as twenty-eight. We devoted many an hour with those men to a discussion of this terrible condition of things, and we believe we made a little temporary impression, but something far more potent than an individual effort is needed to put things right. The hordes of lazy vagabonds who prostitute all moral and economic reasons, who lounge about the street corners under the careful tuition of professional agitators, fuming fire and brimstone upon every tradition of decent life that does not assist them

COBHAM COLLEGE DOORWAY.

in their desire to get what they have not toiled for, and reap what the Almighty never intended should be theirs, never give a thought to these things. The man who sees facts, not as through a glass darkly, but face to face, and who can by any powers of conviction show these poor fools what they do, by bringing small armies of people into a crowded world, will lighten the problems which for half a century have utterly baffled the brains of the finest political and moral economists of Europe. And, for the love of God, let some of us try.

SIR HENRY RAWLINSON.

WE regret to record the death of Sir Henry Rawlinson, Orientalist, explorer, and Assyriologist. Of all the officers employed in the first war in Afghanistan, he was the most successful, and he remained through a long life the ablest expositor of the “forward policy” in relation to the Indian frontier. He had an unshakable conviction, says the *Spectator*, that our real enemy in Central Asia was Russia, and he pleaded steadily for a policy which, wrong or right—and we venture to doubt it still—is now supported by every expert familiar

at once with the country and with arms. He knew the language and literature of Persia as few men have ever known it; but his greatest contribution to modern thought was his discovery in 1846-49 of the way to read the cuneiform inscriptions in Behistun. That was at once a triumph of learning and of insight which placed him at the head of all Assyriologists. His claims were never seriously questioned, either in Germany or at home, though others starting from the foundation of his knowledge may have outstripped him in the race of discovery. Throughout a long life, he was always consulted, and his innumerable papers on Asiatic antiquities and Asiatic policy will, whenever they are collected, be found a mine of information. He was latterly, perhaps, a little too fixed in his opinions, and he rapped sciolists roughly; but he was a sincere man, and the vast stores of his memory were always at the service of any one whom he believed to be honestly searching for the truth.

FROM SURREY HILLS TO STRAND TEMPLES.

A CHAT WITH H. GREVILLE MONTGOMERY, OF THE BUILDING EXHIBITION.

SOMEWHERE in Surrey, though I cannot bring my mind to say where, seeing that it is still sweet in the old World's ways, and frank and fair with the breath of Surrey Hills, is a quaint place where old cottages are glad to live and old barns are thankful to tumble down, finding a rest after serviceable days. It is all just what one may find in Surrey without looking, stumbling upon its prettiness and its peace by happy hazard; or you may look for such a curious corner and still not find. There is a hamlet in a vale where people are content to dwell, and there is a hillside where the man of town may gain the view that is to last him through the piled up papers of the day; a vista glad as any perfume in a garden. A scrub of common gives breadth and breeziness to the greeting; o'erhanging gables make you look up for the girls of bygone days; there are finger-posts directing you to Nowhere, and you are glad to go; and, here and there, green ruin, instead of grey, makes the picture prettier, though plaintive, ending the sweetness with a sigh. This is no Arcady of the imagination; Leader paints near by those gleams when lights are low, that stunted spire black against a saffron sunset; the trees black too, and the houses dimming; here and there the flicker of a candle in a darkened home; the pale chastened water-stretches, timidly reflective of the sober sky; the sense of calm after storm and smile after rain—can you not hear the curfew toll the knell of dying day? Here, too, Doulton, famous for decorative ware, is content to farm and lose a pound an acre, and up on the hill-top, guarded by pines, the air scented by resins and layers of needles, is the home of the man who has set his shoulder to the Agricultural Hall, and pulled the Building Exhibition project through.

Who cares to come, from all this sense of freedom and fresh air, even with Mr. Greville Montgomery, to his station, though the cob goes well, and you spin through the three miles that lead you there?

It is a different business on the fourth floor of the Outer Temple, Strand, with the Law Courts a-buzz opposite; the eternal “lift” that bears you upward, and is never there to take you down; the glimpse of mere sky, and thankful for that, one may obtain in Mr. Montgomery's private room. You are in the midst of plans and papers; there is little scope for your picturesque principles; and a disordered window-sill, a comfortable chair, and no place for the sole of your hat are the

rewards of mounting this, one of the few temples that men enter; possibly the only elevation a few men reach.

Mr. Montgomery is thirty-one years old, and, though he grows a beard, his eyes light up so that you forget the graver air. With not the faintest intention of asking him any questions, and fully aware that we only needed to talk, I got Mr. Montgomery to speak of himself. He did this pleasantly, and I found it a pleasant subject, full of the unexpected and utterly the reverse of prosaic. I think we may be said to have talked all round the building, and presently we got back to that start in life which so very soon seems so very long ago.

"I am Surrey, sheer Surrey, and there is no county like it in the kingdom!" His eyes gleamed.

"Oh! say the World," said I.

"The World is not cut up into counties," said he, looking as if he had scored.

"But the pride of *your* county is your country. The World is cut up into *that*," said I.

Someone outside thought he heard a laugh, and this is a bad sign when you are waiting.

"But the beginning?"

"Oh yes. Well, do you know, I was eighteen and quite green from college, and I was stupid enough to reply to an advertisement in *The Times*, and Mr. W. S. Caine, M.P., afterwards a Lord of the Admiralty, was kind enough to make me his private secretary, and I told him I knew little or nothing about it, and he told me there were five hundred and fifty applicants, including some forty 'varsity men, and that my one suitability seemed to be I had asked a higher salary than *than any of the forty*."

"I refrain from remarking upon that trite subject: Luck," said I. "Now and then it is a good thing, even for a young man to aim high."

"And Mr. Caine was one of the best friends I ever had, in fact I owe more to him than to any other man, and when I ventured upon a hankering for journalism Mr. Caine was very emphatic. 'If you go into journalism you will starve,' said he."

"One can't starve in Surrey," I ventured; "there are always the fruits of the field and the fowls of the air. But did you?"

"What?"

"Go into Journalism?"

"Not altogether just then. I exchanged the Commoner for the Peer and became secretary to Lord Yarborough."

"What Brocklesby?"

"Yes! Brocklesby!" looking surprised.

"And Thornton Abbey with its splendid gateway and its niches not left desolate, and

the stone-vaulted drawing-room in the Abbey Farm?"

"Yes, *how do you know?* 'And Thornton Abbey?'"

Then we fell a-talking of a county dear to both, though native to neither; a county of calm country days and long summer sunlights in Brocklesby Park; of the scarlet Hunt in old-time Brigg, where you may sleep under an "Angel's" roof; of the broad river bounding northern Lincolnshire; of the days when there seemed little to do, and Mr. Montgomery wrote two or three letters a day until Lord Yarborough told him he was simply spoiling his chances and letting his abilities lie fallow there.

"And now Journalism?"

"No. I was secretary to Sir Edmund Lechmere next; that would be in 1885; and, finally, secretary to the late Duchess of Montrose."

I looked at Greville Montgomery wondering if he were a Dr. Jekyll and a Mr. Hyde. But the smile was still boyish and clear.

"And you could tell me some stories—not quite architectural?"

"There is a slight unfriendliness between *could and would*."

"Oh, yes; I know. But this haunting idea of Journalism. You burned your boats after the 'battle with Montrose.'"

"I did; and lived in Shere and sent up articles and did interviews for anyone who would take them, and nearly fulfilled Mr. Caine's prediction. And then I joined *Pearson's*, and perhaps, without unpardonable vanity, I may say I started some decent journalistic ideas there. Did you know 'Famous Faddists' and 'How the rich live'? And then I left."

"Your 'individualities diverged' as one might say."

Greville Montgomery laughed, and the man outside wondered if he would be still sitting there at the crack of doom.

"And then the *British Clayworker*—that clever little trade monthly of yours. Who threw that hearty brick at your head?"

"I had been carefully thinking of a trade journal, and a man came to me and suggested one for clayworkers. I asked him if he would enter into partnership with me, and his reply was, 'Not a penny.' So much for his faith in the idea. But we have been going three years now, and you have only to look at our forty pages of advertisements to feel comfortably convinced of our success. Do you know, my timid friend suggested, mildly, that a share of the profits would seem his little perquisite; but I'm afraid no one else could see his discretion in that light."

"Why! we are actually at 'the Exhibition' after all," I said.

"Are *you* really," said he; *my* thoughts are very much at home, there, just now. Do you know, the Exhibition is a success this time. The real thing; no humbug. Look here. Look at this plan. Do you see all those stalls marked off; they are taken and *paid for*. Take one particular branch. We shall have eleven brick-making machines at work; at the Royal show you will never see more than five. You will be surprised with the magnitude of the show, and so will the public. We are entirely excluding the bazaar element; we accept *bona fide* exhibits only. I believe in making a thing go, once you have made up your mind. When I took the Exhibition in hand, some of my friends warned me of certain failure; two other men had failed, how could I make it succeed? That is just it. One man can make a project go, where others have failed. Others, perhaps, have not gone on long enough. I said 'there is no question of success; it must and shall succeed.' But it has entailed upon me an enormous amount of work, and I have even had to give up dear old Surrey—save at the week ends. A fortnight hence we open; the A. A. and the Institute have countenanced us; we shall have handicraft competitions in bricklaying, carpentry, joinery, masonry, smithing, plumbing, plastering, decorating and tile-fixing. We shall give medals; the technical schools are jealously in

our favour; materials will be tested; we shall have lectures—Professor Banister Fletcher on 'Architecture,' Mr. Collins on 'Sanitation,' Mr. Arnold Statham on 'The Law relating to Building Contracts,' and so forth. The Building Exhibition will astonish the pessimists. We have attempted to pull the Exhibition out of disrepute, and we have won."

"And to win—in anything—is to wish for a fresh conquest."

"That is my creed also."

And then, after I had risen to go, I sat down again, for H. Greville Montgomery can keep you entertained, and the man outside, hearing fresh loud laughter, mistook *that* for the crack of doom!

MR. ALFRED GILES, late chairman of the Union Steamship Company, and ex-president of the Institute of Civil Engineers, died on Sunday night. For some years Mr. Giles represented the borough of Southampton, of the docks of which port he was the engineer, succeeding his father in this post. He designed the dry dock there, which in its day was the largest in the world, and also the Empress Dock, opened on July 26, 1890, by the Queen. The growth of the port under the care of the London and South Western Railway amply justified the policy advocated by Mr. Giles of keeping that port as the company's head quarters.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
12th March, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

Is it a piece of satire that the whole block of buildings belonging to the Improved Industrial Dwellings Company, at Highbury, has been without water for a month? "Betterment" may get beyond comfort. An ordinary inmate of an ordinary house is nearer the water main, and this has meant improved language since the pipes gave up activity and settled down to suspended animation, leaving the householder in animated suspense. A man—a "Sufferer"—an Industrial In-dweller, complains that sixty stairs led him down to the friendly, unfrozen pint of water. The man surely desires to say steps. Sixty steps are a decent little treadmill of themselves. But he makes the mistake of living at the top of an Industrial Dwelling. A "Sufferer" wishes to know why the Company does not set up a temporary hose-pipe or something for the benefit of its own customers. Seeing that the thaw had set in the Company turned off the water, as if it had not been off long enough. This was to obviate any indecently deluging "bursts." After this, the Industrial Dwelling Company's occupants will be tantalised to read that "the pipes" do not freeze in Russia. The houses are very rarely without water in St. Petersburg, and then only for a day or two. You see they manage these things better by burying the pipes deeply, beyond the grip of frost. What may be described as the plumbers' harvest is reported from Liverpool. Since the recent severe weather no fewer than 12,230 lead pipes have burst. The consumption of water, owing to taps left running, has been enormous, the quantity being 57,000,000 gallons in excess of that used in the corresponding period of last year.

THE author of "The Gentle Art of Making Enemies" has now added another name to his list—Sir William Eden. The dispute between Mr. Whistler and Sir William, which has been under discussion in the French Law Courts, is in many ways instructive. For one thing it affords a commentary upon the unbusinesslike habit which most artists possess of allowing a patron to leave open the question of price until the picture is finished; for another, it throws a light upon the mental valuation by which even a more or less enlightened patron appraises the productions of artists of all ranks. It shows that on neither side the contract to produce and accept a picture is regarded as more than a vague understanding, a careless arrangement in which all the important points are to be left over for subsequent settlement; and it proves that there is still in the art world an amount of idyllic confidence in human nature. Mr. Whistler, with his rank among living artists, and his

knowledge of the manners and customs of the picture buyer, was inexcusably careless to allow himself to be persuaded to set to work upon the disputed picture under a shadowy agreement, which was open to any amount of re-arrangement. Sir William Eden, on the other hand, cannot be congratulated upon his rather contemptuous method of bargaining with an artist of Mr. Whistler's standing. The impressionist painter must be meditating a Nocturne upon the Baronet, or it may be merely a bad quarter of an hour—not, at any rate, a pleasant "impression" for either side, or the art world generally.

BELGIAN iron has fought its way into English markets, but our railway rates and the cost of English labour are not entirely responsible for this. According to a correspondent in the *Engineer*, there is an element in foreign competition which is not so much taken into account as its importance demands. Recently, he says, an iron roof, 50 feet by 40 feet, was required within three miles of Charing Cross. The order went to Belgium. "Cheapness, of course," most people will be ready to exclaim. Well, partly owing to

BARFRETON CHURCH.

that, but principally, adds the correspondent, "because no native firm could be depended upon to deliver it within the prescribed time." Now, why should this be? Labour is, no doubt, cheaper abroad, and longer hours worked; but is there any reason why these difficulties should have a third added in uncertainty of delivery? The inference to be drawn is that the English firms are either not able or willing to cope with these swift and sudden orders. They are employing workmen up to their contract necessities rather than to trade possibilities. Yet, considering the general scramble, it is a serious business to read of work like this going abroad. It is notorious that Belgium iron can be dumped down in England at an extraordinary cheap price in any accessible town, but that orders are going to Belgium simply because English firms cannot undertake to complete their contracts by a definite day is new news. We should imagine the uncertainty in the labour market—outcome of much trade agitation and irritation—is responsible for this. The cheaper labour

and longer hours of Belgium workers are sufficiently formidable in themselves, without any further handicapping.

THE most expensive private residence in the World—that of Mr. Cornelius Vanderbilt, which stands at the corner of Fifth Avenue and Fifty-seventh street in New York—has at length been completed. It has cost a million; and a small garden adjoining it, on which stood a twenty-five thousand pounds house, has cost one hundred thousand pounds. As it will only be occupied six months in the year, the rental will figure out at about three hundred pounds a day. This rental is a little beyond the average man.

THE strike of operative painters at Douglas seems to be a serious business. It is the old story: the men allege they are paid less than English painters, and they feel that the wages should be levelled up. The painters form a large and important industrial body, and have all struck work with the exception of about a dozen non-society men. The masters declare that they intend to resist the demand of the men, and the latter are equally firm and determined. The Masters' Association has had a meeting, and see no reason to depart from the decision already come to, not to grant the increase in wages asked for. So far there has been no "picketing" of the few non-society men at work, but a strike of painters in the spring may make its mark upon the Douglas season, leaving the stucco grey—instead of gay. It takes some paint and equal whitewash to keep Douglas in order, and even then the place is scarcely respectable in August.

THE receiving days for pictures at the Royal Academy are the 29th and 30th of this month and April 1st, and for sculpture April 2nd. The winter exhibition closes on the 16th inst. The receiving days at the Salon des Champs Elysées are, for pictures, from March 14th to 20th; for drawings and water-colours from March 14th to 16th; for sculpture from April 1st to 5th; for busts, medallions, &c., from April 1st to 3rd, and for architectural drawings and engravings from April 2nd to 5th. The new English Art Club will probably receive on April 1st.

THE use of glass of a green tint has, for half a century, been a characteristic peculiarity of the plant houses at Kew Gardens. In 1889 the experiment was made of substituting white glass for green in the east wing of the tropical fern-house. The improvement in the growth of the plants was remarkable. In 1892 a portion of the west wing was also re-glazed in the same manner, and the new temperate fern-house was wholly glazed with white glass. The result with the *Gleichenias* and other half-hardy ferns was everything that could be desired. As the result, it has now been determined to abandon the future use of green glass altogether.

WE note that Dr. Cameron, Medical Officer of Health for Leeds, has tackled the unhealthy area question. This can hardly be in view of our remarks last week, yet the coincidence is singular. At the meeting of the City Council, held on Wednesday last, Dr. Cameron submitted what is described as an "official representation." So often official documents and true representations are at variance, we welcome this bold Cameronian attack. The more so that it does not flinch. The unhealthy area is clearly set forth, street, lane, —and letter. "Certain houses, courts and alleys within that area (specified) are unfit for human habitation; the narrowness, closeness and bad arrangement of the streets and houses, and the want of light, air and ventilation and other sanitary defects are dangerous or injurious to the health of the inhabi-

tants; finally, the evils connected with these houses, courts or alleys, and the sanitary defects, cannot be effectually remedied otherwise than by an improvement scheme for the re-arrangement or reconstruction of the streets and houses within such area." Here is a piece of straight speaking, nothing burked or buried. Leeds has shocking slums in its midst, in this respect neither better nor worse than other large towns. Towns, as they grow, congest and contract their centres; the axis becomes rotten, while the spokes radiate suburbanwards. Fifty years ago a stringent system of surveying and planning would have prevented all this, but instead, of supervision, towns enjoyed the sportive privilege of going and growing as they pleased. We are paying the penalty now in the enormous prices for the clearance of wretched and ruined property. Our grandfathers failed to recognise that right angles and fresh air are first cousins, and so the crooked is still to be made straight, and the rough places plain; until that is done, we shall suffer in health or in pocket. The Corporation of Leeds would seem to be willing to back up Dr. Cameron.

THERE is no end to the uses of advertisement, and one questions the "sweetness" of Adversity's victor. Puffery and picturedom attacked Switzerland a while ago; now the "art" would seem to have reached its climacteric at Geneva. The latest contrivance is called *l'affichage sub-lacustre*, and consists of advertisements which can be read several feet under water, the subject being painted in yellow letters on a black ground, and so placed that the words are magnified. It is at the Pont du Mont-Blanc, in the crystal clear waters of the Rhône, that this deformity is first to appear. One may well cease, in a poetic moment, from gazing into the "glassy surface of the lake," seeing that it now makes eyes at you, recommending you to wash your face, perhaps, or use so or something for your hair. The Pyramids have been made "useful" in this fashion; the Alps have taken to patent medicines, instead of their own keen, life-giving air. The night itself is not sacred, witness the flashing frankness of more than one much advised pill. Now the lakes are wearing lables in their bosoms—the pretty keepsakes! We expect Narcissus would be sadly surprised if she went to her Well. She would not know her own face amid these floating phrases, yet, being a woman, she might not be happy till she "got it," whatever it might be.

WE hear that a memorial bust of the late Lord Coleridge will be placed in the Royal Courts of Justice. A number of his legal and personal friends think that his memory deserves to be so honoured, and they intend to ask the authorities to assist them in this project. The only Judge to whom, as yet, a monument has been raised in the Courts is Sir George Jessel. There are two statues in the edifice, but neither is connected with the Bench. One was erected to the memory of the Architect, and the other to the Clerk to the Commission which arranged the building of the Courts. So that Art has even won recognition in the Courts, while the Law itself, with one exception, has modestly hid its face. But then the Law is always with us like the poor, though Judges pass away.

SPEAKING of Art, we have been reading the confessions of a tattooist. The tattooist, it seems to us, is legitimately engaged upon the decoration of man. This is Sculpture, if not Architecture, and some authorities say the two things are akin, though more than one learned spokesman took a different view at a recent A. A. meeting. However that may be, the tattooist cannot be condemned

for lack of "originality of line." "Here," said he, "are my tools, a number of pen-holders, on the ends of which are fixed small needles, two or more in number. With these the skin is punctured. A small device can be done in an hour; a large one takes about six hours; and over one exceptionally difficult design I was occupied no less than 22 hours. My charges depend on the size and intricacy of the pattern to be tattooed. They range from 4s. or 5s., for which I can tattoo a simple monogram or crest, to as much as £20." A tiger stalking prey would seem to be a favourite pattern, but there are people who prefer to have a fox hunt tattooed all down their back. We say again, at the risk of becoming trite, there is no accounting for taste. We expect shortly to hear that a paper has been read upon the effects of Light and Shade in tattoo. We hope the author will not serve an injunction upon us, for we shall make all effort to report it. There can be no question: Man can, *after all*, be "architecturally examined!" The tattooist says nothing about Woman.

THE most recent of the small exhibitions opened at the Fine Art Society's Gal-

STONE CHURCH.

lery consists of 80 water-colour drawings, by Mr. George S. Elgood, representing "Gardens in Many Lands." They have been painted in various parts of France, Italy, Spain, and North Africa, and should furnish many useful hints in the laying out of grounds and in the proper development of that picturesque environment which so helps to set forth an architect's designs. The subjects have been judiciously selected, and many of them are depicted in a manner showing, not only the most careful observation, but an appreciative sense of their especial character and beauty. "Ilex Avenue, Villa Borghese," "The Campagna from the Villa Aldobrandini," and the small "Villa Lante, Viterbo," are among the best of several drawings in which rich renaissance architecture and ancient trees are exquisitely blended.

SOME hidden machinery is evidently needed to help the spontaneous eloquence of more than one eminent divine. We are informed that the pulpit in the nave of Westminster Abbey has a movable floor, which can be

raised or lowered at pleasure to suit the height of the preacher. One day a very short man was expected to preach, and the pulpit floor was raised considerably. Being prevented by illness, or some other cause, he was unable to fulfil his appointment, and at the last moment a substitute had to be provided. The clergyman who obligingly undertook the office proved to be a man of lofty stature, of stature considerably above the average. On reaching the head of the pulpit staircase he saw to his dismay that the official in charge of the simple machinery had apparently not been informed of the change of preacher. The tall divine scrambled into the pulpit on his knees, a very correct but more than an uncomfortable position, seeing that he preached his sermon without the use of his legs, so to speak. It was fortunate his abilities lay in his head.

WITH the view to obtain hints which may be useful in the designing of contemplated extensions and improvements in the Kirk-gate Markets, Leeds, about a dozen members of the Corporation Markets Committee, including the Chairman (Mr. Knowles), recently devoted a couple of days to an inspection of the markets in Birmingham, Liverpool and Manchester. Proceeding to the Midland city, the deputation got an idea of what the fine meat market which is in course of erection will be when completed. From Birmingham the committee journeyed to Liverpool, and saw the wholesale and retail fish markets and the splendid meat market which is being built there. They then took train to Manchester, where they found much to interest them. This is a thorough-going way of obtaining the very latest information.

JAMES NASMYTH was one of the most instructive companions I ever met with writes Mr. John Murray. With him there was no attempt to monopolise conversation, but a modest, quiet way of imparting his information, which was enhanced by his broad Scottish accent and his practice of illustrating every point, either by a simile or by a pencil sketch, generally drawn with his left hand, for he was a strenuous advocate of the use of the left hand as well as the right on all possible occasions. I never knew him converse on subjects which he had not mastered, or at least studied; but, even with this limitation, his information seemed inexhaustible. It so happened that I had crossed the Tay Bridge in a gale of wind a few weeks before its collapse, and was talking to him about it, when he said: "It has always seemed to me that the constructors of that bridge made a great mistake in taking the letter I instead of A for their model. Look here," he continued, rising from his chair, and straddling his legs wide apart, "you give me a push sideways, but you can't move me. Now" drawing his feet close together and standing bolt upright—"the least lateral pressure will upset me at once." He confessed to possessing but little knowledge of the higher mathematics, or belief in their use for the work in which he had spent his life. He was a firm believer in "Consols," which he used to call his "antibilious stock," because it never caused him a sleepless night or a headache in the morning; but the conversion was a severe blow to this comfortable doctrine of his. One of his favourite schemes, which I believe he laid before the authorities of the Admiralty, was for the construction of a craft for "bandboxing" ships of an enemy. This craft was to contain a long iron beam, running fore and aft, and ending at the bow in a blunt nose just below the water-line. His idea was that these vessels should be very quick and handy, and float very low in the water, so as to ram an enemy's ship, while affording the least possible mark for shot or shell. The idea of arming a costly

line of battleships with a ram, which in action was likely to prove as injurious to the striker as to the struck, always appeared to him erroneous.

THE discovery has been made that the rays of the arc light have a decided therapeutic value, and that the naked arc, *i.e.*, without a glass globe, may be a very useful disinfecting agent in hospital wards and places where the rays can be projected directly on the organisms. Experiments were made in this way in the Paris sewers, with the result that considerable purifying action was noted. Anyone who has frequented arc light stations must have noticed the pleasant odour of ozone around them caused by the generation of the current. In some of Nikola Tesla's wonderful experiments with high tension currents a remarkable quantity of ozone is given off, and care has, in fact, to be exercised not to ozonize the air too much in this way. Sunlight is a great disinfectant and purifier, and, as electric light approximates to it, one can understand something of this power to arrest bacterial development, and to sterilise sources of infection and corruption. While this is true of the arc light, which burns in the open air, the incandescent lamp has another distinct advantage over ordinary illuminants in the fact that there is no combustion going on inside it, and that it, therefore, does not consume the oxygen of the air and vitiate the atmosphere. Both kinds of electric light—the arc and incandescent—can be used in giving patients a bath of light, with a result equivalent to a combined light and vapour bath. The skin is browned as if by sunburn, and the effect is described as most salutary. The light is used in this work in combination with a lens and reflector for localising the rays.

THE Art writer whose contributions are signed "R. A. M. S." has been expressing his views on etching, but he broadens for a moment into a greater theme. He says:—"A man who lives facing a noble view ceases to look at it, in spite of the variety of weather, unless it be for the going and coming of ships, the passage of troops, an unusual display of fireworks, or some such exceptional and transitory interest. In fact the voice of nature palls unless the subject is continually changed. It is the privilege of the work of art to speak two languages at once. While pretending merely to recount the details of a building or to reconstruct the topography of a country side, it can discourse nobly in the musical language of proportion, in the poetry of related lines, in the harmony that comes from an artistic control of all the material used. This secondary, this decorative speech of the picture, keeps gently appealing to you while in many of your moods the importunate statement of natural facts knocks at a deaf ear. As he pursues a very conventional branch of art in which he can imitate very little of nature, the etcher is forced to make patterns that strike the spectator, that soothe his eye by suavity, or stimulate it by an unforeseen vivacity. Above all, everything must count, everything must co-operate in the result; superfluity is disastrous. The force of the impression produced is in inverse ratio to the amount of means used. When you have learnt something about the architecture of the cathedrals or counted the trees in etchings like Mr. Burgess's "Peterborough Cathedral," Mr. Law's "Durham," Mr. Bird's "West Front, York Minster," Mr. Haig's "On the Stour, Canterbury," and even Mr. Slocombe's "Spring Time," which you can do rather less easily than in a photograph, what is left for you to look at? Nothing intrinsically beautiful, subtle, or varied in aspect. In this kind of work all details are given the same value and architectural features are shown with the same pertinacity from top to bottom of

a cathedral. The result is something without beauty of line, without dignity of mass; a scrabble of small scratches out of proportion to the size of the plate." There is a touch of acidity, as well as of acerbity, in the criticism. "R. A. M. S." writes with the "needle" rather than the pen.

THE series of six sketches dotted through this number are from the National Silver Medal drawings made by Mr. Harry P. Clifford and they are the very finest pen drawings we ever remember having seen.

It is well to be early in the field. We desire to draw the attention of our conflicting County Council to the condition of Trafalgar Square. Notwithstanding the fact that it is within a few yards of the seat of wisdom, the slush now reposing in heaps about Trafalgar Square, originally fell as snow on the 23rd of January, and was added to by a second fall on the 5th of February. The mild weather has done much to reduce these mud monuments, but the subsequent drainage across the footpath is insult to injury.

HEAT without light, and, therefore, with the expenditure of a minimum amount of energy, has been rendered nearer a reality than before by the experiments of Professor Ebert. These results were obtained through the medium of vacuum tubes with the aid of electric alternating currents of high frequency. To attain a candle power of from one-thirtieth to one-fortieth of that of a standard English candle, he found the energy

ENTRANCE TO CANTERBURY CLOISTERS.

actually expended to be only about one-millionth of a watt. Yet the efficiency of his "luminescent lamp" is said to be many hundred times that of the incandescent lamps now in use. "Cold light," therefore, promises to be one of the actualities of the future.

A PARAGRAPH in the *Times* set forth that the largest gift to the Centenary Fund of the Methodist New Connexion had been made by Mr. Littlewood, of Sheffield, "who contributes £3,000 towards the erection of new school premises in connection with Scotland Street Chapel in that town." This set a correspondent thinking: "Mr. Littlewood, of Sheffield." The thought suddenly struck him—"this may be the Mr. Littlewood who gave a ring of bells to Walkley Church. But it is not usual for Church and Chapel to be thus generously helped from the same hand. I went to find Mr. Littlewood. I succeeded beyond my expectations, finding both Mr. Littlewood and his wife, 'my book-keeper, cashier, and traveller,' as he good humouredly introduced her." It may well be expected that a man can afford a little belfry harmony when his wife is all that.

At a little place called Tutbury, there would appear to be an extraordinary dwelling. The District Council met on Thursday and shook its head sorrowfully, but could do nothing. The inspector said the dwelling was situated near Postern Farm House, and was built of half-brick—*i.e.*, four-and-a-half inch—walls, which were, of course, very damp; the plaster was falling off, the ceiling tumbling down, the pantry roof giving way, and the out-house and pig-sty completely in ruins. The occupiers were a woman and her son, who kept a cow in a wooden shed reared against the four-and-half inch wall, separating it from the bedroom, and a donkey in the ruined pigsty: while three dogs were kept in the house, and twenty fowls had the run of the interior, monopolising the chairs and tables. The inspector was of opinion that the "house" was not fit for human habitation. Some members said the cottage was locally known as "Tin-pot Hall," and another wanted to know whether the tenants were Irish. The matter was eventually referred to the medical officer, and "Tin-pot Hall" continues to stand until he comes to the rescue of its inhabitants. There is more vice than virtue in a four-and-a-half inch wall.

"LACKING in distinction, and not overburdened with originality," is a criticism that reaches us with respect to the Spring Exhibition of the Royal Institute of Painters in Water Colours, which opened yesterday. One of the attractive features is the contribution of the President (Sir James Linton), which deservedly occupies the place of honour. This is a notable departure from the type of composition, ordinarily some mediæval scene, which the veteran artist usually essays. It represents the three-quarter length figure of a fair-haired girl in a dress of russet brown and grey, her delicate features and wealth of auburn hair being well set off by a broad-brimmed Gainsborough hat. The exhibition is exceptionally rich in landscapes, some of them being works of unquestionable merit.

In a paper recently read before the New York Academy of Sciences, Professor Woodward arrives at the conclusion that the earth is "solid," that, as Lord Kelvin contends, it has no cavities below a comparatively shallow depth. The only fluidity is when, from some local cause, the pressure is somewhat relieved. Otherwise the earth must be, instead of molten in the centre or with a plasma of liquid matter under the crust, nearly as homogeneous as steel. But movements of the crust, such as subsidence, elevation, crumbling, &c., have still to be accounted for, and these the solid theory fails to explain with anything like satisfaction. Lord Kelvin's conclusions as to the world's age, which we noted very recently, are criticised rather severely as resting on "very questionable data," and as having "fettered geological thought in the last thirty years to too narrow limits of time." Yet, as the time allowed has risen from twenty million to four thousand million years, surely the geologists ought to be content. The world will soon grow young again out of very age—we would suggest that its second childhood has arrived.

WHILE there can be but unanimity of opinion as to the desirability of any measure that would lessen the number of trade disputes, it cannot be said that the Bill introduced by Mr. Bryce seems calculated to produce that result. It would enable the Board of Trade to create Conciliation Boards, but as the appeal to their services would be optional, and as the Boards would have no means of enforcing their decisions, it is difficult to see in what way such a feeble proposal as this would improve the present

state of things. When both parties are ready to submit their claims to arbitration, there is at present no difficulty whatever in finding arbitrators. It is believed, however, that the Bill may not even come to a Second Reading.

THE President of the Royal Academy will be fully represented this year. He is engaged on a number of very beautiful works, notably, a life-size head of a beautiful girl, seen in profile, looking upwards with an earnest expression, and distinguished by noble features, admirably drawn and modelled. Another picture is of an English girl with golden hair flowing over her shoulders. "Lacrine" is the present title of a larger picture, which may be taken as a type of grief, and represents a Greek maiden near a pedestal. Her face is somewhat downcast; one of her hands hangs at her side, while the other is placed upon the abacus of the pedestal. She wears a pale, ashy-blue robe over a much darker blue tunic. She has brought a cup for libation to the manes of the dead, and a withered wreath lies near her feet. Yet another is a life-size figure of a Greek lady, wearing a yellowish saffron or amber coloured dress, and seated upon a large chair covered with grey skins, over the back of which she has cast her finely formed and rounded arm, while she rests in stately ease. "Flaming Summer," another whole-length figure of a maiden in a Greek dress. Her head has fallen upon her breast, and her arms are folded in her lap. The figure is foreshortened from her feet, and her face, somewhat flushed in sleep, is half enclosed by the pale rosy orange tissue of which her dress is formed.

It appears to be an extremely easy thing for persons to become undignified, and to cast their good reputations to the four winds of heaven on the first possible occasion. Anything more monstrous than the attempt of the Imperial Institute big-wigs to wriggle out of paying their rates we have not heard for a long time. The Imperial Institute was founded for a great purpose. The Governors have obtained the land practically in perpetuity from the Commissioners of the 1851 Exhibition, at a rent of £5 a year. The site is 5 acres, 2 roods, 26 perches in area, and on it buildings costing £314,000 have been erected. The endowment fund at present stands at £140,000, and there are 8,000 Fellows who pay a respectable yearly subscription. At the final hearing of the case, Sir Peter Edlin very wisely considered there was nothing to exempt the Institute from the ordinary law applying to public buildings, and which also included hospitals and charitable institutions of that sort. The rateable value has been fixed at £11,781.

A CURIOUS case is pending in the Queen's Bench Division, and is being further considered at the moment of our going to press. Messrs. Gant & Slatter, architects and surveyors, of Hastings, have had a little difference with a Frenchman "who also lived at Hastings and owned property there." Mr. Lacroix desired two or three rooms added to his house, and the plaintiffs were employed as architects. A County Court action arose and was settled, Messrs. Gant & Slatter taking £55 in discharge of their claim. Now comes the further grievance. Plaintiffs allege that the defendant continued to write insultingly, and on an odd occasion actually assaulted one of them in the street! The principal thing complained of by the plaintiffs was a statement which they said accused them of having made use of a false receipt for £2 16s. 6d. in reference to goods supplied in connection with fire-places. The present action was for damages for libel and for an injunction to restrain the defendant from continuing to publish the statements com-

plained of. Mr. Gant and Mr. Lacroix vied with each other to amuse the Court, and, ultimately, Mr. Justice Hawkins adjourned until yesterday so that Mr. Lacroix might finish his impassioned and somewhat unintelligible address to the Jury.

OYEZ! OYEZ! OYEZ!

LISTEN all ye who labour, to the words of G. Bernard Shaw, who, in adding his testimony to Dr. Parker's forecast of the "Socialism in the Twentieth Century" in *Great Thoughts*, thus delivers himself:

IF YOU ARE A WORKING MAN, in the Twentieth Century you will find that you will always be able to obtain steady employment from the Vestry, or the County Council, or the Corporation, or the Government, at a wage fixed, not by the competition of starving men for bread, but by public opinion (including your own opinion) as to what is sufficient to enable you to live and bring up your family as a decent citizen, in return for your eight hours' work a day. If you work for a private employer, he will have to treat you equally well, to prevent your leaving him and getting public employment.

COBHAM COLLEGE FIREPLACE.

Your children will be trained in Board Schools, which will turn them out better educated—both technically and generally—than the best paid skilled workman of the present century; and there will be plenty of scholarships to enable them to pursue their studies, and go up to the universities, if they have special talents fitting them to enter the learned professions. You will travel by rail when and where you please, as freely as you now walk along the roads; so that you can live in the country and work in the town. You will buy your bread and milk at the County Council bakery and dairy, just as you buy your stamps at the Government post office. You will pay your rent to the local authority; and it will include a constant supply of hot and cold water and electric light. And you will become entitled to an old-age pension, sufficient to save you from becoming a burden on your children, before you are sixty.

MR. A. LEACH, Assistant Charity Commissioner, has visited Northallerton, to inspect the site for the proposed new Grammar School at Northallerton, which he has approved of. The cost of the site is £500. It is proposed to extend the accommodation of the National Schools.

WOOD PAVEMENT.

IT is stated that Mr. Lewis Clement has devised a non-slipping wood paving of a simple and inexpensive character. It consists in preparing the wood blocks before they are laid, by boring a few holes in them and filling the holes in with a hard-setting substance, composed of crushed stone, bitumen, and Portland cement. The compound is cleared off level with the surface of the blocks, and when they are laid the roadway is covered with a series of rough spots, which arrest the foot of the horse in any condition of the weather, and prevent the animal from slipping.

SOCIETY MEETINGS.

Liverpool Engineering Society.—The tenth ordinary meeting of the session of the Liverpool Engineering Society, took place last week at the Royal Institution, Colquitt Street. Professor Hele-Shaw, presided, and a paper was read by Mr. D. B. Morison, M.I.Mech.E., entitled "Experiments in Connection with Evaporation." The paper was much appreciated.

The Sanitary Institute.—A Sessional Meeting of the Institute will be held at the Parkes Museum, to-morrow, March 13th, at 8 p.m., when a discussion will be opened on "Back-to-Back Houses," by Mr. James Niven, M.B., M.A., Medical Officer of Health, Manchester, with illustrations of various types of back-to-back houses met with in practice, and the methods adopted for dealing with this class of property by Mr. Thomas De Courcy Meade, M.Inst.C.E., City Surveyor, Manchester. The chair will be taken by Sir Francis Sharp Powell, Bart., M.P. (Vice-President). Tickets for the admission of visitors may be had on application to the Secretary.

The Institute of Builders.—The annual general meeting of this Institute was held at the Offices in Bedford Street, Strand, London, on the 5th instant, when the election of officers for the ensuing year took place. Mr. Robert Neill, Jun., J.P., presided. The Secretary, Mr. R. S. Henshaw, read the audited account. The Council having decided to oppose The London Streets and Buildings Bill promoted by the London County Council, it was considered advisable that the Institute should act in concert with the Central Association of Master Builders. A long report was circulated among the members previous to the meeting, bearing upon the subject.

The Institution of Civil Engineers.—At an ordinary meeting of this Institution held on the 5th inst., two papers were read which dealt with the Transmission of Power by Electricity. One on "Water Power applied by Electricity to Gold Dredging," was by Mr. Robert Hay, M.Inst.C.E., and the other by Mr. Robert Robertson, on "Electrical Haulage at Earmock Colliery."

The Edinburgh Architectural Association.—The members of this Association recently paid a visit to the New Royal Observatory, on Blackford Hill, where the President, who is also the architect of the building, gave them a short description of the principal features of the buildings, which include the Observatory proper, the Astronomer Royal's house, houses for the assistants, and a lodge for the mechanic with stabling accommodation.

Society of Engineers.—At a meeting of the Society of Engineers, held at the Westminster Palace Hotel, Westminster, Mr. William George Peirce, president, in the chair, a paper was read by Messrs. W. Workby Beaumont, M.Inst.C.E., and Stephen Sellon, A.M.I.C.E., on "Parliamentary Procedure as affecting Light Railways and Tramways."

A. A. Camera Club.—At the last meeting of the A. A. Camera Club, held at 56, Great Marlborough Street, W., on March 4th, a most interesting lecture was given by Mr. Arnold B. Mitchell, F.R.I.B.A., on "Vaulting." The lecturer traced the development of the vaulted roof in England step by step, and illustrated his remarks by many excellent lantern views.

ANNOUNCEMENTS.

Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

THE EDITOR does not hold himself responsible for the opinions of Correspondents, whose communications should be brief and plainly written on one side of the paper.

The BUILDERS' JOURNAL goes to press on Monday at 6 p.m. All matter must reach the Editor by the first post on Friday morning to ensure its treatment in the current issue.

Publishing.

The terms for free post Subscription to any part of the United Kingdom is SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments. Subscribers in London or the Suburbs receive their copies by the first post delivery on the day of publication.

Advertising.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS WANTED.

Per line (about 10 words), Sixpence.

Minimum charge, Eighteenpence.

Three Insertions for the price of Two.

SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS, TRADE AND GENERAL ADVERTISEMENTS.

Four lines (about 40 words), Three Shillings.

Each additional line, Sixpence.

Prepayment in the above Advertisements is absolutely necessary.

The charge for Paragraph Advertisements on the Front Page is Fifteen Shillings an inch, single column. Minimum charge, Five Shillings. Paragraph Advertisements on ordinary page, single column, Seven Shillings and Sixpence per inch.

MANUFACTURERS' ANNOUNCEMENTS ON ORDINARY PAGES.

Per Page, Single Insertion, Eight Guineas.

Discounts for series on application to the Manager, who will make Special Contracts for Announcements on Back and Leader Pages and positions facing matter.

NOTICE.—Advertisements for current week's issue are received up to last post on Saturday. Alterations in standing Advertisements must be made before 6 p.m. on Fridays.

Advertisers in THE BUILDERS' JOURNAL may have their replies addressed to the Manager's Office, free of charge, and may have them forwarded if addressed envelopes sufficiently stamped are sent.

Reading Cases, lettered in gold, may be had from the Manager. Price, One Shilling.

Editorial and Publishing Offices:
Talbot House, Arundel Street,
Strand, W.C.

A *Times* correspondent states that the Egyptian Government has received 88 designs for the new Cairo Museum building, of which 28 were from Italy, four were local, and the remainder were from America and European countries other than Italy.

THE new cable which has recently been laid across the Atlantic weighs six hundred and fifty pounds to the mile. This is the biggest of all the cables. Although this latest one is larger than the others, the fashion of making cables has not changed since 1851. More than twelve million pounds are now invested in Atlantic cables.

The Builders' Journal.

MEN WHO BUILD.

No. 5.

Mr. JOHN MCKEAN BRYDON.

SOMEONE has said—you don't know when or where—that architects are a sullen lot. The author of the remark had never met John Brydon.

John McKean Brydon—he tucks himself away in Newman Street, a street which smacks of art and artists—started work more than a quarter of a century ago with Messrs. Hay, of Liverpool, with whom he spent the customary probationary period. Being on the upward grade he naturally went north from Liverpool, until reaching Edinburgh he stayed with Mr. David Bryce; and Glasgow, where he entered the offices of Mr. Campbell Douglas. Having well imbued himself with Scotch Baronial Art, he straightway turned his back upon his Highland Goddess and discovered that the broad road to success led south. London claimed him, and in the offices of Messrs. Nesfield and Shaw he got the one remaining influence which converted him into a passionate disciple of Wren and Inigo Jones. It is one of the curious anomalies of the study of architecture that a really good man invariably practices the style he had most disliked as a student. Perhaps it is that the moment of striking out finds him more independent in thought than he has hitherto been, and should the demands of his first commission draw him out of his own personal groove, the range of his conception gets expanded and he finds delight in that which he has previously avoided. You are writing these lines with the sea lapping the nose of

your little Yawl as it swings at anchor within a stone's pitch of the sandy beech. Above the Cliff stands a charming "hut" glaring in the redness of the morning sun. It is the one warm picturesque feature amid a cluster of the usual seaside houses, and it is as delightful in its internal arrangements as it is in its external aspect. And yet it is the work of a man who once fearlessly told you that red brick had been the curse of English architecture. Nothing has happened to that aspiring architect, but that he has changed his mind, his method and his style, and what was once hideous in his eyes now finds favour in his inmost heart. Almost as much may be said of the late Gilbert Scott, of George Street, of Charles Barry, and of many of the best living practitioners of the moment.

The early work of John Brydon consists of "Lewins," and its home farm in Kent; "Pickhurst," in Surrey; and additions to "Holmwood," for Lord Bramwell; and a

A VILLAGE CLUB—BY J. M. BRYDON.

CHELSEA VESTRY HALL.
J.M. Brydon, Architect.

house and studio in St. John's Wood for James Tissot, the French painter, for whom he is now reinstating and enlarging the Chateau at Buillon, the plans of which are upon his boards as you enter his sanctum. His later work consists of St. Peter's Hospital, in Henrietta Street, Covent Garden, opened by the late Duke of Albany, in 1882; the Ladies' Residential Chambers, in Chenies Street; and the fine New Hospital for Women, in the Euston Road, opened by the Princess of Wales last year. It was not until 1889 that Mr. Brydon got his first real chance to produce a public building after his own heart, and that he did after winning the open competition for the Chelsea Town Hall, which you are able to illustrate on another page. Then followed the Chelsea Library—which is also illustrated—and which is undoubtedly the finest public library of its kind in London. The circular entrance porch is a very fine piece of work, and the detail of the hall and staircase and of the Reference room on the first floor have been much admired. Also in limited competition, and also in Chelsea, Mr. Brydon gained the South West London Polytechnic Institution, which is now in course of erection on a site adjoining the Chelsea Free Library. In this particular district the hand of the builder seems already at the throat of great possibilities, and it would be more than gracious if Mr. Brydon were permitted to influence a little of the native architecture which is creeping, in a very debased condition, from Cadogan's monstrosities farther west.

The Village Hall at East Grinstead, which we illustrate—and which, at the moment, is lying devastated by fire—is an excellent sample of a kind of work John Brydon has done too little of. His practice has not been a "domestic" one; he has devoted himself more particularly to public buildings, the most pretentious of which is, perhaps, the Municipal Buildings and Technical Schools at Bath, which he gained in a limited competition and which is still building. At Bath also, he is engaged upon the additions to the "Spa," and on the much vexed question of restoring the old Roman Baths. A lot of hubbub has been raised over the latter work, but it may safely be left in the hands of so careful a man as John Brydon to develop itself as his veneration for the Romans may dictate. You are privileged to see the drawings for the work, and the very elaborate set of water-colour sketches and photographs made to assist the architect. The bases of the piers, which for centuries have surrounded the silent "pool," will be religiously preserved; the colonnade, which in a measure will be rebuilt, springing from bases set back from the original columns which supported the old Roman work. When all this is completed, it will still leave John Brydon without a work which is thoroughly representative of his fine talent. London can do with a great deal more of his solid style, his fine planning and his splendid detail. No one has ever found John Brydon aught else but refined in his designs, free from the fashionable absurdities of much modern work, and intense in his convictions that what is good is best. Before your visit to Newman Street had ended, a few instructive moments were devoted to the questions which were eating out the hearts of the fighting members of the Institute, but as Mr. Brydon is a prominent member of its Council, it would not be wise to detail the conclusions arrived at.

The wind has sheered round to the nor-east, and the "crew" of your privateer has notified his desire to sling out while the tide serves. So much, therefore, for Mr. John Brydon, a man of much charm of work and mind, without sullenness, and without much that has caused many good men to

fail. We are cast off from our moorings, and are heading, under a spanking breeze, for the Nore. We shall slew round off the coast-guard at Shoebury to send our M.S. to town, or thousands of readers in all parts of England will miss their "Men who Build," on Tuesday morning.

COTTON, CRAPE AND SILK PRINTING IN JAPAN.

A STRIKING feature in the Japanese materials is the elaborateness of the designs which are printed on even the cheapest of stuffs, the boldness of the design, its originality, its variety, and the intricacies and fierceness of the tints and colours, demonstrating at once that the result is not obtained from blocks and rollers. After silk damasks, crape is the favourite article affected by the Japs for dress. In this the weft is composed of threads which have been forcibly twisted either to the left or the right. The cloth is woven with two shuttles, two or four shots being given with the left twisted thread from one shuttle, and the same number with the right twisted thread from the other shuttle. On the removal of the fabric from the loom it is placed in a bath and boiled for some hours with straw ashes, and then washed, when it will be found to have shrunk very much, especially in its breadth. It is then stretched and rolled on a wooden cylinder, and dried in the sun. When finished it has an uneven surface, which it will always retain. From the weaver the material passes to the printer, who works in sheds open on three sides, and has rows of long narrow boards on trestles. On these are strained the cottons or other fabrics to be dyed, and to the rafters above are hung the boards on which the stuffs partly printed are drying before the completion of the process. Several men and boys are employed, and their sole materials are stencil plates, paints and brushes, the methods being much the same, no matter how elaborate the design. A stencil plate made of stout water-proof paper is temporarily fixed by means of brads to the cloth and board beneath, and with a spatula of bamboo, a paste of rice, and other materials, is spread rapidly and evenly over the surface of the plate. The paste passes on to the cloth through the patterned spaces of the stencil plate, and thus covers the portions it is intended to leave white in the design. The plate is then removed and the rice paste is permitted to dry. The workman then treats the entire piece of fabric in the same manner. A series of stencil plates are then used in succession, in order to draw in the outlines and put in the colours and shades of the design. Thus one plate will give the outlines of one half of the birds and flowers, the rest of the outlines being completed by the next plate. With a third plate the brown tints of the birds' wings are put in, with a fourth their beaks and claws, with a fifth any other colour of their plumage, with a sixth the pink shades of the plum blossoms, with a seventh the green leaves, and so on, the number of the stencil plates being only limited by the complication of the design and by the variety of the colours and tints in it. The colours are laid on moist with flat round brushes, rather stumpy. The depth, tone and shading of the colours depend on the taste and skill of the workman, and the designs, no matter how complicated, are executed in a very rapid manner, and soon the long strip of material is covered with birds, flowers, fans and other ornamentation, the base being left white. If it is desired to dye it blue, the parts which have been already printed are covered with a thin layer of rice paste. When dry the entire surface of the material is brushed over with a paste of indigo and rice, or it is dipped into the indigo

vat. The fabric is then steamed to fix the colours by the mordants with which they are mixed, and finally the rice paste is washed off, when the design of birds, fans, plum blossoms, flowers, and what else, on a blue ground will be found as clear and distinct as if just drawn with the brush, the simplest as well as the most elaborate designs going through precisely the same processes, and such a method permits of the greatest elaboration. Some very beautiful effects are obtained by painting, and often the material passes from the stencil printer to the painter, who, with a small brush, puts in tints or markings on wings, or feathers, or flowers, shading and combining colours with rare skill, and with an intuitive perception of the beautiful in tones. Many of the more artistic designs on silk crape, in which one may search in vain for the repeat pattern or diaper design, are painted entirely by hand. Touches of silk embroidering sometimes enrich and give point to the dainty designs of the ficus and ovis worn by Japanese ladies. In all crape printing factories there is an artist employed who sketches in black and white the new designs for which stencil plates are to be cut. The artist squats on the ground, and with clear rapid strokes of the brush, with nothing before him, he draws design after design of birds, fruit, flowers, animals, and all else beside, in combinations ever new but ever old, and invariably pleasing and artistic. Silks and satins are printed in the same manner as cottons and crapes, and in some of the factories in which the best class of work is executed, the combination of stencil printing, painting, and embroidery produces triangles of textile art unmatched in the world for beauty and for skilful manipulation. Velvet is also printed so as to produce pictorial effects, the pile being cut only just sufficiently to enhance the design. Sometimes the results are extremely good, and these printed velvets are framed and hung up as pictures by Western buyers. Plain-coloured stuffs are so little employed in Japan that vat dyeing, save in the case of indigo, is very little practised, but to meet the wants of foreign visitors, crapes and silks are now more frequently dyed in plain colours than formerly, and, unfortunately, aniline dyes are gradually displacing the old vegetable dyes of the Japs. Indigo obtained from the *Persicaria*, purple from the store crop called *Shikon*, green from the flowers of the *Saphora Japonica*, black from tannate of iron, and others from turmeric, Brazil wood, madder, safflowers, mulberry, pomegranate, and the peach tree are some of the sources whence the Japanese obtain their dyes. A favourite method of pattern dyeing is by knotting. Points of the crape are pinched up with forceps, and a thread is tightly wound round their base, the cloth, covered closely with these knots, either in rows or in some pattern, is dyed. When dry the thread is unwound and the cloth spread out, when it is found to be covered with irregular rings and dots. Coming to the wages, the ordinary workman in the printing and dyeing factories are paid from 5 to 10 yen a month—which is from 4s. 3d. to 8s. 6d. a week, inclusive of Sundays—for a day's work of from 10 to 11 hours. The designers and artists have 75 sen, or 2s. 6d. a day. Apprentices are taken at ten years of age for five years, and are boarded and clothed, and are given a little pocket-money on the two holidays per month to which they are entitled where Sunday labour is enforced. It were well if Japanese cotton and crape prints were introduced into England, and as they can be sold at about the same price as English hand block-printed goods, we should like to see their use extended in this country. For decorative purposes alone a great future would be theirs.

PLUMBING.

MR. PETER FYFE, Glasgow's Sanitary Inspector, has been lecturing the municipal magnates of his city on the future plumber work, referring to the responsible nature of the duties the practical plumber had to perform. He found, he said, that in greater Glasgow there were 239 master plumbers, employing 1,151 journeymen and 239 apprentices. Of the masters, 115 undertook steam and hot-water heating, 124 confined themselves to plumbing pure and simple, and 200 were prepared to assist in the distribution of water in the city at a pressure of 1,000 lbs. to the square inch. All recognised the fact that since the plumber came to add the extraction of sewage from the home to his first duty of supplying pure

obtaining heat and power in large cities' predicting that in 1945 Glasgow would warm herself, cook her food, and drive her motors by very different methods than those employed just now, and in these, he was convinced, the future plumber should have a predominant share. In New York in 1882 works were established to supply steam at a pressure of 80 lbs. per square inch to the citizens from central stations. Two main stations had been erected by the New York Steam Company capable of supplying high-pressure steam up to 19,000 horse-power per hour. The main wrought-iron pipes from these stations extended through nearly eight miles of streets, yielding power to between 500 and 600 steam-engines, but principally heat to public and private buildings. For a continuous supply of one indicated horse-

steam for £14 12s. 6d. nightly, or per annum of 3,000 working hours for £4,387 10s. Out of this sum which might be obtained for the steam, what might be termed the pure loss was its equivalents in coal at 7s. a ton, which amounted to £1,213 12s. 6d. per annum, and the firemen's wages, which of course were at present lost. The power of these furnaces, if utilised with suitable machinery, was capable of supplying 562 arc lamps of 2,000 candle-power, which would light on the low-tension system 19 miles of streets. He considered further that the Corporation were in quite an exceptionally good position for trying the power and usefulness of steam for heating and cooking in a few selected buildings near to any of their works, either in tenements belonging to themselves, or by special arrangement in the property of

CENTRAL LIBRARY, CHELSEA—J. M. BRYDON, ARCHITECT.

water, he jumped from being a tradesman yielding comfort and convenience into the position of a health protector or a health destroyer. He knew from experience in his official position that lives were yearly undermined and cut off through inefficient workmanship in pipes and drains. They would therefore all agree with him that no individual should be entrusted with the conception and construction of work who could not give evidence of a full knowledge of its principles and practice. Therefore the necessity for a State-protected register of the men who were accounted fit to fulfil the law. Not till then would the modern plumber be regarded as the trusted friend of every household instead of its deadly and most troublesome foe. Mr. Fyfe afterwards spoke of the possibility of the introduction of more rational methods of power per hour a charge of about 3d. per

hour was made, which for a working period of 3,000 hours during the year amounted to £9 7s. 6d. Small users paid more, viz., £12 10s., and large users paid less, or £7 10s. In Glasgow these charges would be greatly reduced, as both our fuel and our labour are much cheaper. Coming to the cost of heating, he found the charge was about 9s. 6d. for each 1,000 cubic feet of space heated during 182 days of the cold season at 24 hours per day. He estimated that at two-thirds of this cost the same thing could be made to pay handsomely in Glasgow. In connection with our refuse despatch works, the cleansing committee consumed in the furnaces of the destructors 94 tons of what was technically known as "soft core." He had found by experiment that the committee were in this way parting with a commodity they might be able to sell in the form of

private proprietors. Mr. Fyfe then proceeded to describe a system in operation in Paris for the transmission of compressed air from central stations, and showed its sanitary advantages as a motive power in factories, workshops and shops.

LAST week at the Wrexham County Court his Honour, Sir Horatio Lloyd, gave judgment in the case of the Ruabon Brick and Terra Cotta Company v. William Brown. The defendant is a builder at Chester, and the contractor for the erection of the new Fever Hospital at Rhyl. Among the materials ordered by him for the purpose of carrying out the contract from the plaintiff company, were a number of French grey enamel angle bricks, which the defendant maintained were not made in accordance with his instructions, and hence he refused to pay for them.—His Honour gave judgment for the plaintiff company for the full amount claimed.

JEAN FRANCOIS MILLET.

The Peasant Painter of Barbizon.

By ARTHUR O'NEIL.

Concluded from page 62.

He is already suffering agonies, but nevertheless he works and consecrates to us some of the finest of his masterpieces. Here is a characteristic letter in that sorry time: "The weather is dark and rainy, the sky cloudy and low, but you know I like it better than the sunlight. All is of a rich and melancholy colour which leaves my eyes quiet and my head calm. At Fontainebleau, I saw again Rosso and Primaticcio. They are strong fellows. They are of the decadence, it is true the fixings of their figures are often absurd and in doubtful taste, but what a strength of conception! And how strongly this rude *bonhomme* reminds one of a primitive age! It is as child-like as a fairy-tale, and as real as the *bonhomme* of old times. In their art there is a reminiscence of Launcelot and Amadis de Gaul, and the seed of Ariosto, Tasso, and Perrault. One could spend hours before those good-natured giants." And to quote again, here is a passage from his counsel to his friend Sensier, which may be usefully recommended to the critics of to-day. Sensier has been commissioned to write a series of articles on the Salon of 1865. Millet writes to him in these terms, in congratulating him on his happy task: "It seems to me you might show—going back somewhat—that Art began to decline from the moment the Artist did not lean, directly and naively upon impressions made by nature; that cleverness naturally and rapidly took the place of nature, and decadence then began. Strength departs without constant relation with nature, and as example the fable of Antæus could be used, whose powers diminished when his foot did not touch the ground, and on the contrary took new vigour every time he could touch it. . . . Show that, for the same reason—the abandoning of nature—art becomes more and more weakened. Give as many examples as possible. Once again, I am sorry we cannot talk it over. I send . . . some extracts, in which you can find some good quotations, or else take the substance of them—Montaigne, Palissy, Piccolpassi, and his translator, Claudius Popelyn. I will try to find others. I will ruminate upon it, and say as best I can what comes into my head. At the bottom it always comes to this: 'A man must be touched himself in order to touch others, and all that is done from theory, however clever, can never attain this end, for it is impossible that it should have the breath of life.'"

With one more extract I shall propose to begin to draw my friendly task to a close. What should be the dominant thought in all art creations? This is Millet's view, written in February, 1873, to M. Camille Lemonnier, a Belgian writer, who had early discovered the Barbizon painter's transcendent merits:—"I am very much flattered," he says, "by your letter, and thank you for making me acquainted with your work as art critic. The most enviable reward of those who try to do their best, is to excite the sympathy of intelligent men. This is equivalent to saying that I am happy to have been the occasion of your expressing certain truths of art. Only, you say of me things, which I consider to be so desirable, that I dare not believe myself possessed of them. It is not that I would doubt your judgment, but I distrust myself. But let me put myself aside quickly, that I may say (without stumbling over my own toes) that I must give you great praise for considering things from their fundamental side. It is the only true solid side. Many people, far from taking this point of view, seem to think that art is only a sort of show of professional ability. You understand that the Artist must have a high and definite aim. Without it, how can he make efforts to reach a point of which he does not even suspect the existence? How can a dog pursue game which he cannot scent? It depends, therefore, upon his aim, and the way in which he has reached it, that an Artist is of interest." Bear with me a moment more, if I trouble you with one only further testimony to the fervid heart, which has long since palpitated its last. It is the tribute of a Painter to a

Painter; it is Fromentin, who writes of Millet in the touching words, I am sure none here will consider of the nature of extravagant eulogy—"An original Painter of our own time, a lofty tone, a melancholy spirit, a good heart, a nature truly rustic, has said of the country and country people, of the severity, the melancholy, and the nobility of their work, things which no Dutchman would have ever dreamed of looking for. He said them in a language a little rude, and under forms where the thought has more clearness and vigour than the hand. We were deeply thankful for his tendencies; and in the French School of Painting, we saw in him the sensibilities of a Burns, less clever than the poet in making himself understood. After all, has he or has he not left beautiful pictures? Has his form, his language—I mean that exterior envelope without which the things of the mind cannot exist or last—has it the qualities to make him a beautiful painter, and to assume his future fame? He is a profound thinker compared with Paul Potter and de Cropp; he is a sympathetic dreamer compared with Terburg and Metsu; he has something incontestably noble when we think of the trivialities of Steen, Ostade and Branwer. As a man, he puts them all to the blush; as a painter, is he their equal?"

[FACTS ABOUT LONDON.]

MR. DAVID J. ROSS, the engineer to City Commissioners of Sewers, has reported on the works executed by his department during 1894. He mentions that 127 dangerous structures were reported upon and dealt with. The frontages of a number of houses in various streets were set back with a view to widening the thoroughfares. The whole of the premises on the south side of St. Paul's Churchyard, lying between Dean's Court and Paul's Chain, and extending back to Carter Lane, being about to be rebuilt, lines of frontage were arranged. Dean's Court is to be widened from 10 ft. to 22 ft. Plans were prepared showing the properties required to be taken in Upper and Lower Thames Streets, between St. Paul's Station and Tower Hill, to make the thoroughfare 35 ft. and 40 ft. respectively. These were submitted to the London County Council, who agreed to contribute one-third of the net cost of the improvement at the west end of Upper Thames Street provided the Commission would undertake the portion of the proposed northern approach to the Tower Bridge within the City, towards the cost of which portion the County Council were prepared to contribute one-half. The question of making an improvement at the western end of Cheapside had also, with three alternative lines, been submitted to the County Council, but no result had yet been arrived at. The electric lighting of the City was continued throughout the year. There were now 483 arc lamps in use. The total length of main thoroughfares lighted by arc lamps was about 13 miles. The number of gas lamps discontinued was 1,338. No fewer than 1,116,000 people and 92,000 vehicles entered the City daily, and 301,000 passed the entire day at work within the City—numbers which were not equalled, or even approached, by any other city in the world. The quantity of refuse removed had been 72,782 vanloads, or about 233 per day. All the rooms and shops at the artisan's dwellings, Petticoat Square, had been let, and the artesian well furnished an ample and continuous supply of water.

At a meeting of the Doncaster Rural Council on Saturday, it was resolved to apply to the Local Government Board to sanction a loan of £3,000 for the purpose of constructing a new sewer at Wheatley. The Council, on the recommendation of the committee, accepted the offer of the Rev. T. C. Taylor to sell land for sewerage works at Thurnscoe.

TROLLOPE'S "BLACK LIST."

IN the Court of Appeal on Wednesday, judgment was given by Lord Halsbury and Lords Justices Lindley and A. L. Smith in the case of Trollope & Sons v. London Building Trades Federation and others. The defendants, J. Vernon and others, appealed from an order of Mr. Justice Kekewich of February 8 last, by which he restrained them from circulating or issuing a document called "Trollope's Black List," which was a list of workmen who it was alleged were working in contravention of the rules of the union. Messrs. Trollope & Sons are the well-known builders, and a suspicion arose in 1894 on the part of some of their workmen that they were not acting up to the spirit of an agreement come to in 1892 between masters and men in the building trade, by which the masters agreed not to treat it as a disqualification that men seeking employment were trade unionists, and on the other hand the members of the trade union consented to work with men who were not members of the union. A letter was written by Vernon to Messrs. Trollope on October 24th last, calling their attention to the fact that for some time complaints have reached the federation that at certain of the plaintiffs' works union men had been refused work with the statement that only "free-labour men" would be engaged, and informing the plaintiffs that a deputation would wait upon them. The following day Mr. Trollope and Mr. Vernon had an interview, at which, it was alleged by the plaintiffs, Mr. Vernon demanded the dismissal of two of the foremen, on the ground that they had made a difference between non-union and union men, and threatened to call the men out if his demand was not complied with. Mr. Vernon, on the other hand, denied the threat to call the men out, and that he required the dismissal of the two foremen. A strike, however, commenced on the 1st of November, when 175 men left the works, though a considerable number remained. The places of those who had left were filled up, the works were picketed in the usual way, but the picketing not being successful, the pickets were withdrawn on January 14. A list was then prepared, called "Trollope's Black List," which contained the names of men who refused to comply with the regulations of their trade, and it was posted up in the offices of the different unions. Upon this plaintiffs moved before Mr. Justice Kekewich, who granted an injunction restraining the publication of the list. Lord Halsbury, in giving judgment, said that though the defendants might have a right to inform the union of the conduct of workmen, the mode they had chosen to do it by was in excess of the requirements. The defendants, moreover, admitted that they did not propose to further publish the circulars, but declined to give any undertaking. For these reasons the Court would not interfere with the decision of Mr. Justice Kekewich. Lords Justices Lindley and Smith concurred, and the appeal was dismissed with costs.

At the Port Sanitary and Hospitals Committee of the Liverpool Corporation there was read a letter from the Assistant Secretary, Local Government Board, with reference to the borrowing of £26,000 for extension of the City Hospital North, the consideration of which was postponed on the 31st January, 1895; also a letter from the Assistant Secretary, Local Government Board, enclosing sanction for borrowing of £26,000 for extension of this hospital; and the committee has adopted a resolution that the Council be recommended to place the sum of £25,000 at the disposal of the Port Sanitary and Hospitals Committee for the purpose of the extension of this hospital.

THE Church House has received an anonymous donation (from "A. B.") of £1,000.

ELECTRICITY FROM WATER POWER.

A GREAT amount of public interest has been aroused in the North of Scotland in connection with the formation of a British aluminium company to utilise the water power at the Falls of Foyers, on Loch Ness, which form one of the great attractions for tourists during the summer. It is proposed to bring the material from Ireland to Foyers, and there manufacture the metal with electricity as the motive power. The works will give employment to 100 men in a district where there is little or no population; and the buildings, the company state, will be of an ornamental character to harmonise with the beauty of the surroundings. Public feeling was somewhat

SAWDUST.

It is proposed by the Town Council of Leicester to borrow £1,600 for a new police station at Aylestone, and the matter has been referred to the Watch and Free Libraries Committees, to confer as to the desirability of providing for a branch free library in connection with the building. The Wesleyans have purchased sites on the Belgrave Road, at Clarendon Park, and at New Evington for the chapels and halls which it is proposed to erect.

In connection with the movement for the purchase of Carlyle's house in Chelsea, with the object of making it a place open to visitors, and of preserving Carlyle memorials, the committee, of which Mr. Leslie Stephen is chairman, has issued an appeal to the public for subscriptions. The price of the house is £1,750. A considerable sum has already been subscribed.

THE new chancel of Christ Church, Linthwaite, was on Saturday afternoon consecrated by the Bishop of Wakefield, and the church was re-opened after undergoing considerable alterations and improvements, which, together with the new chancel, have been carried out from designs and plans by Mr. C. Hodgson Fowler, of Durham. The cost of the addition and alterations, including a new organ, is about £2,500, towards which £1,600 had been raised.

THE Metropolitan Asylums Board has accepted the tender of Messrs. S. J. Jerrard & Sons, of 40, Loampit Vale, Lewisham, for fencing in with split-oak fencing, entrance gates, &c., the Park Hospital site, for the sum of £2,194; and the tender of Messrs. W. Johnson & Co., Limited, Wandsworth Common, for the erection of a boundary wall, with entrance gates, &c., around the Fountain Hospital site, at a cost of £2,770.

THE WICK VICARAGE. MR. ASTON WEBB, ARCHITECT.

allayed by an official statement, made at a meeting on Friday, to the effect that it is not proposed to do away with the falls, and that the flow of water will only be affected in very dry seasons. As tourists from all parts of the world visit the falls, the subject is one of national interest, and it is understood that the Secretary for Scotland has ordered an official report on the proposed operations of the company.

THE unit used in measuring the strength of electric currents was first called "an ampere" by the French Electric Congress of 1881, the name being given to it in honour of Andre Marie Ampere, the French scientist, who elucidated the theory that the magnetism of the earth is the result of electric currents circulating around it from east to west.

MR. George T. Sibbering, C.E., has prepared the estimates of capital expenditure required in the event of Parliament sanctioning the new works sought to be carried out under the powers contained in the Taff Vale Railway Bill of the present session. The total estimated expenditure is set down at £48,565, of which £46,090 is required for the proposed extension of the sea-wall on the south side of the sea entrance to the Penarth Dock Basin. The balance of £2,475 is for lengthening the bridge which carries the public road over the company's main line at Gelliwastad.

THE plans for a new church at Ardlin, Loch Lomond, have been approved by the Dumbarton Presbytery, the cost being, estimated at £500.

It has been estimated that it will require eighty-five men working every day until 1947 to unearth the entire ruins of Pompeii.

THE new Wesleyan Central Hall, which it is intended to build in Daniel Street, Ancoats, Manchester, will provide accommodation for 1,000 children on the ground floor, and in a hall above this will be accommodation for 1,000 adults. The cost will not be less than £7,000, towards which over £4,000 has been promised.

A VALUABLE collection of minerals, precious stones, and geological specimens has been bequeathed to the Derby Museum by the late Mr. J. A. Birds, of Bournemouth.

PLANS for a new market have been adopted by the Guildford Town Council, and will be submitted to the Local Government Board together with an application to borrow £8,000. The plans have been prepared by Mr. F. T. Maltby, the Borough Surveyor. Provision is made for widening Woodbridge Road to 40-ft., while an enclosed walk, 12 ft. wide, will run the whole length of the market.

Trade and Commerce.

We shall be glad to receive copies of catalogues from firms engaged in the allied building trades. These will be carefully looked through, any novelty noted, and—should its nature seem to demand it—fuller attention drawn thereto. We are particularly wishful to secure the friendly interest of designers and artificers in THE BUILDERS' JOURNAL, and, now and then, we might see our way to reproduce an outline sketch or illustration of any contrivance that struck us as being new or needed. Building covers up—figuratively, and in fact—so much ground, and we mean to cover the whole of it.

We should be further obliged if firms would indicate, by some suitable mark, the pages in their catalogues to which they would, in particular, desire to call our attention.

Sewer-Pipe Joints.—Messrs. J. & M. Craig, of Kilmarnock, are bringing out a new pipe, the rights of which they have purchased from the patentee, Mr. T. Fitzgerald. A most satisfactory test has lately taken place in Dublin in the premises of Messrs. Monsell, Mitchell & Co., 67 to 73, Townsend Street. The method of joining sewer-pipes exemplified in the new invention has been devised to overcome defects in the old system, which resulted not only in considerable trouble and expense to builders, but in many cases involved imperfect drainage and consequent liability on the part of householders to typhoid fever and other dangerous maladies. Messrs. Craig & Co., Kilmarnock, who are now manufacturing pipes with the new joints, have appointed Messrs. Monsell, Mitchell & Co., their sole agents for them in Dublin. The new joints, by an ingenious arrangement, insure in the connected pipes that perfect uniformity of bore which is essential for proper drainage, and the efforts to obtain which have hitherto invariably given such trouble to engineers, contractors and others. In addition to this they save a considerable amount of labour, enable the fitting of "gaskin" to be dispensed with, and require less than half the amount of cement that is necessary to join pipes in the ordinary way. Mr. D. Baird applied a hydraulic pressure of 100 lbs. to the square inch to the joints without discovering the slightest sign of leakage, and several architects, engineers and contractors examined the joints, and expressed themselves as being pleased beyond all expectations.

Electric Lighting.—The fine new printing works of the Geraldine Press, Limited, 21, Whitefriar Street, Fleet Street, E.C., and also the block of offices belonging to *Answers*, Limited, 24, Tudor Street, E.C., formerly lighted by gas, are now lighted throughout by electricity. Mr. E. R. Dolby, Assoc. M. Inst. C.E., of 8, Princes Street, Westminster, acted as consulting engineer for the proprietors. The current is produced in the basement of the works of the Geraldine Press, Limited, by a compound-wound direct-current dynamo, built by Messrs. Crompton & Co., and driven direct by an engine made by Messrs. Belliss & Co., of Birmingham. About 190 lamps have been installed in the works, and about eighty lamps in Tudor Street, and the lighting of both premises is controlled from one switchboard fixed close to the dynamo. The large Hoe machine used for printing *Answers*, and also the Marinoni machines used for printing the large number of other papers published at the same offices are lighted up internally by incandescent lamps, which much facilitate work. The wiring of the buildings was carried out by the Electrical and General Engineering Co., of 86, Leadenhall Street, E.C., under the supervision of the consulting engineer.

Oates & Green, of Halifax.—This firm send us their illustrated catalogue, for the current month, of their sanitary specialties, builders' requisites, refractory materials—fire, pot and setting clays, fire bricks and covers—and farm and stable fittings, which latter call for special attention. The illustrations are

splendidly and accurately drawn, and are just what catalogue illustrations should be. Messrs. Oates & Green have a long-standing reputation for turning out good work, and their prices, as stated in their catalogue, are quite reasonable.

Cooper's Suction Pump.—Mr. A. P. Cooper called at this office to elicit our interest in his suction pump, which "forces" stopped up drains, sinks, and water closets, by drawing out the obstruction instead of forcing it through. For instance, the inventor produced a rusty french nail about 7 inches in length, which he had drawn out of a lavatory waste. After performing on the floor cloth in our reception room, and succeeding in damaging it to a value of half-a-crown, he invited us to see his pump in action on our own lavatory arrangements, but we declared ourselves perfectly satisfied with the pump, which is very reasonable in cost.

Lift Brakes.—It ought to be widely known that Messrs. Easton, Anderson & Co., Limited, of London and Erith, sell a safety attachment that prevents any make of elevator from "running away" with itself, from any untoward accident to the pipes or chains.

Whitfield & Co.—Messrs. Whitfield, of Birmingham and London, send us their illustrated and priced catalogues of safes, strong room doors, and other contrivances to defeat the ravages of fire and the burglar. The best we can say of this well-known firm is that we have ourselves placed two orders with them.

THE Office of Works has included in its estimates a sum of £1,000 for the partial renewing of the heating apparatus in the palm house, Kew Gardens. The total length of hot-water pipes in the palm house has been estimated at 22,600 feet, or about 4 1/4 miles. Notwithstanding, it has always been difficult to maintain a satisfactory temperature in the north wing during winter.

It is proposed to enlarge St. Michael's Church, Boldmere, Sutton, at a cost of £25,000.

THE GLASGOW THEATRE FIRE.

THEATRE fires have been numerous of late, and now the Glasgow Theatre Royal—one of Mr. Phipps' buildings—is in ruins. Fifteen years ago it was erected on the site of another theatre burnt down. The recent fire has resulted in the complete destruction of the auditorium and stage, and practical constructors will be interested to note the present state of the concrete floors in the

THE CORRIDOR.

corridors; these, constructed without iron joists, came down in large sections when anything fell upon them. The fire brigade complain of this startling unreliability, while the iron columns supporting the tiers held out very well; even the masonry which was not as much injured as might have been expected. The building is to be re-erected at once, Mr. Phipps again holding the commission.

THE Links and Parks Committee of Aberdeen Town Council has agreed to recommend that the erection of a bathing station at the beach be immediately proceeded with, and that the plans of the pavilion submitted by Mr. Rust, city architect, be adopted. The estimated cost is £3,000.

MR. LITTLEWOOD, of Sheffield, has recently contributed £3,000 towards the erection of new school premises in connection with Scotland Street Chapel in that town.

MR. GEORGE HARLEY, of Liverpool, is stated to have invented a method of manufacturing malleable iron without the process of annealing. The results obtained are surprising. Some Bessemer rails manufactured by this process were tested and found to be without a flaw.

AN application has been made to the Local Government Board by the Leeds Corporation for sanction to borrow an additional £100,000 for the purposes of the Town Hall, recreation grounds, and police stations.

A SPECIAL meeting of the trustees of the Manchester Royal Infirmary, Dispensary, and Lunatic Hospital or Asylum, has been held for the purpose of considering the desirability of enlarging the Manchester Royal Infirmary.

A NEW infirmary is about to be erected at Paisley at a cost of between £60,000 and £70,000. The plans have been prepared by Mr. T. Graham, Abercrombie.

A PLOT of waste land in Thurlow Street, Liverpool, the property of the Insanitary Property Committee, is to be acquired by the Parks, Gardens and Improvement Committee of the Council, and converted into pleasure grounds, at a cost of £550.

AT the annual meeting of the subscribers to Paisley Infirmary, it was stated that a sum of between £50,000 and £60,000 had been subscribed for the new Infirmary buildings.

Correspondence.

The Editor welcomes Correspondence on matters of general interest. Gentlemen thus addressing the Editor should condense their communications as much as possible.

THE VENTILATION OF SEWERS.

To the Editor of "THE BUILDERS' JOURNAL."

The Briars, Selhurst,
March 8, 1895.

SIR,—A letter appeared in your issue of February 26 repeating the old suggestion that sewers should be ventilated by towers, with the implied addition of furnaces.

I think the following remarks may be interesting to the writer of that letter and to many of your readers.

They show, I think, once for all, the impracticability of ventilating ordinary town sewers by means of furnaces.

A furnace ventilating any large district would require to produce the movement of a very large volume of air, and to keep up a velocity sufficient to ventilate all the branch sewers, and the drag would consequently be so great through the main that it would force any house drain traps or water traps we could form, before it would influence the remote branches.

Supposing that the system of sewers consisted of tubes open at their extreme ends only,—instead of being more like flutes, as they really are, having openings in their sides,—that the whole of the air extracted was drawn from the sewers, that all the intermediate channels could be stopped, and that the foul air could be directed from the most remote ends of each of the sewers and distributed over those sewers with the most perfect theoretical accuracy, so as to have a uniform current passing through each of the sewers towards the tower, still the effect upon those would be *nil*; proved as follows:

Let the total area of say $6\frac{1}{2}$ miles of sewers connected with the tower equal 713 ft., and let the total area of the main sewer be say 8 ft.,—that is, about the 90th part of 713,—and suppose the air to be passing through this 8 ft. area at the rate of 542 ft. per minute, which may be called an average velocity; then if this be divided over the whole district, the velocity in all the sewers would be 6 ft. per minute, or 1-15th of a mile per hour. But air currents of velocities of 100 ft. per minute and upwards have been proved to exist in sewers from other causes, and 6 ft. per minute is practically stagnation and not ventilation.

While it is comparatively easy to conduct currents of air through the continuous galleries of a mine having but one or two inlets and a like number of outlets, and a pretty uniform sectional area, such a system cannot be applied to sewers. The areas of the branch sewers discharging into any one main sewer are, probably, much more than a hundred times its capacity; therefore, even supposing it were possible that they could all be hermetically sealed at all points, excepting the ends, a velocity of current equal to 100 miles an hour (which is next to impossible) would have to be obtained in order to secure a current of one mile per hour in each of the branch sewers. But it is not possible to obtain such a condition of things, and this difficulty lies at the root of all proposed modes of sewer ventilation, by extracting the foul gases by furnaces, fans, or such other appliances.

It should be added that friction would decrease the quantities of air mentioned above, to a very appreciable extent.

A main "outfall sewer," without intermediate connections, may be, and sometimes is, ventilated by means of a furnace. But whether this may be called an economical

method, seems more than doubtful, the cost of the fuel consumed being enormous.

The late Sir J. W. Bazalgette, C.B., in his report on this subject, addressed to the Metropolitan Board of Works in 1866, estimating the prime cost of 230 furnaces, chimneys, &c., for the London sewers, to be nearly half a million of money, to which would have to be added about £201,480 per annum for coke, without pricing labour or other incidental expenses. I am indebted to the late Sir J. W. Bazalgette, for many of the facts stated above.—I am, yours faithfully,
CHAS. E. GRITTON, A.M.Inst.C.E.

SAWDUST.

THE Lincoln City Council, on Tuesday night, decided after an animated discussion, to construct public baths, including two swimming baths, on the site on Brayford Wharf, recently purchased of Councillor Pacy, and to abandon the idea of forming a new road on the site, with one swimming bath.

THE tender of Messrs. Parker & Sharp, York, at £1,299, for carrying out the proposed sewerage scheme has been accepted.

WITH a view to induce the construction of better style of shops and fronts in England, the directors of the Confectioners' and Bakers' Annual Exhibition, which is held at the Royal Agricultural Hall, Islington, have decided to give £220 in prizes for specimen shops to be fitted at the hall during the next exhibition, from September 21st to 28th.

A WATCH has been invented which measures distance by sound. The inventor, a French officer named Thouvenin, has called the instrument a phonotelemeter. To operate it, a little button is pressed at the instant of the flash and again at the sound. In the meantime a needle traverses a dial, registering time to the one-tenth part of a second. The rest is a mere matter of calculation.

SIR CHRISTOPHER HAWKINS has presented the freehold of a site for the erection of a Board School at Mellador, in Devonshire. The site has been approved by the Education Department.

THE Liverpool School Board has finally adopted revised plans, prepared by Mr. C. E. Deacon, for the erection of new offices for the Board on a site between St. Thomas Street and Cumberland Street.

LORD PENRHYN has instructed Mr. Young, his chief agent, to add a day's pay to the wages of the 3,000 quarrymen in his employment at Penrhyn Slate Quarries, as an indication of his sympathy with them. This is the more remarkable because, unlike most other Welsh slate quarries, Lord Penrhyn's men have lost only five days' work during the past eight weeks of frost.

A STOCKHOLM correspondent states that of the two companions whom Herr Andrée intends to take with him on his proposed balloon expedition to the Pole, one is now decided upon. It is Dr. Nils Ekholm, meteorologist at the Meteorological Institute in Stockholm, who is a first-class expert in the meteorology of the Polar regions. He was the chief of the great physicometeorological expedition which passed the winter in Spitzbergen 1882-3, of which Herr Andrée also was a member, and in the scientific world he is known as one of the first meteorologists in Europe. Who is going to be the third member is not yet settled, but Herr Andrée has received so many offers from all sorts and conditions of men who want to go with him that he could fill, not only the gondola, but the whole balloon.

THE Board of Trade have approved of the Rhondda and Swansea Bay Railway, which will probably be opened on Monday. The line has taken 14 years to construct at a cost of £900,000.

A CAIRO telegram states that, at a Council of Ministers, under the presidency of the Khedive, it was decided to continue the railway from Keneh to Assouan. The concession for the construction of the line has been accorded, as before, to the Verschauer and

Seiarez group. The line will be 180 miles long, and it is to be finished in twenty-seven months. The Government guarantees the *concessionaires* 4 per cent. annually. The new railway will be of great importance strategically and commercially, and will also afford special facilities for tourists.

THE Harbour Board of Aberdeen has resolved to proceed with the extension of the shed on Provost Jamieson's Quay, and afterwards to widen Trinity and Regent Quays, and erect new sheds there, as recommended by Mr. Wake, C.E., Sunderland. After this work is completed a new steel swing bridge, with a double line of rails, will be constructed in place of the present Regent Bridge. The work will be carried out by instalments, and the total cost will be between £40,000 and £50,000. The Town Council have decided to construct an underground lavatory in Castle street, at a cost of £1,600, and to erect a urinal on the west side of Holburn street, at a cost of £95, and one at the south side of Victoria Bridge, at a cost of £160. The city chamberlain has been authorised to communicate with the Harbour Commissioners so as to ascertain the terms upon which they would feu the piece of ground adjoining the police stables at Poynerook road. The ground measures 1,497 square yards, and will be feued in view of an extension of the stables. It is proposed to put the lavatory in Maberley street into proper condition.

EXTENSIVE improvements have just been completed on the estate of Nenthorn, on the border-line of Roxburghshire and Berwickshire. A new mansion-house has been built (the architects being Messrs. Beattie and Sons, Edinburgh), and electric lighting and a new water supply have been introduced.

AN inquiry under the Housing of the Working Classes Act, 1890, has been held at the Council House, Birmingham, into the scheme of the Corporation for dealing with insanitary property in Milk Street and Little Ann Street. The area of the site is 4,030 square yards, and it is estimated that it will cost the Corporation £5,500 to acquire the property, while the value of the land, when the buildings have been pulled down, is put at £3,350. The Corporation do not propose to take any steps to secure the erection of workmen's dwellings in the place of those pulled down, as there is believed to be no lack of houses in the neighbourhood.

A PARTNERSHIP has been entered into between Mr. George Highton, F.R.I.B.A., diocesan surveyor of Bedford, and Mr. Arthur Ardrion, F.R.I.B.A., of 39, Victoria Street, Westminster. The united practices will be carried on at 39, Victoria Street, Westminster, as Highton & Ardrion, with a branch office at 5, The Crescent, Bedford.

MESSRS. DONALD & SIME having resigned their respective appointments as consulting engineer and works manager of Robert Boyle & Son, Limited, with whom they have been for over eleven and twelve years respectively, have commenced business as ventilating, heating and sanitary engineers.

SOME stained-glass windows have just been placed at the east end of Cononley Church. The principal subject is the Ascension of Our Lord, and the work has been executed, in the style of the 14th century, by Messrs. Powell Bros., of Park square, Leeds.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the work.

ALRESFORD.—For the erection of stable buildings at Langtons, Alresford, Hants, for Colonel H. Stratton Bates. Messrs. J. Colson and Son, F.F.R.I.B.A., architects, Winchester:—

THE "MARPEDO" COMPOUND COMPANY, READING ENGLAND.

TO BUILDERS and CONTRACTORS.

The London County Council is prepared to receive TENDERS for the ENLARGEMENT and ALTERATION of the FIRE ENGINE STATION in Farringdon Road, Clerkenwell.

Persons wishing to tender may, on applying to the Architect's Department, Fire Brigade Branch, 21, Whitehall Place, S.W., and on depositing the sum of £10 in cash, obtain forms of tender and contract with the bills of quantities, and may also inspect the drawings of the proposed work.

The amount deposited will, after the Council has come to a decision upon the tenders received, but not before, be returned to the tenderer, provided he shall have sent in a bona-fide tender, and not have withdrawn the same.

Tenders must be delivered at the County Hall in Spring Gardens not later than TEN a.m. on MARCH 19, 1895, and no tender will be received after that time.

Any tender not made on the provided form, or which has been altered, or is not filled up and complete in every particular, will be rejected.

The Council does not bind itself to accept the lowest or any tender.

The contractor will be bound by the contract to pay to all workmen employed by him the London Trades' Union rates of wages, and to observe the hours of labour and conditions recognised as fair by the London Trade Unions at the date of the delivery of the tender, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

H. DE LA HOOKE, Clerk of the Council.
 Spring Gardens, S.W., February 20, 1895.

BOROUGH of SOUTHEND-ON-SEA. SANATORIUM BUILDINGS.

Builders desirous of Tendering for the ERECTION of one PAVILION, ADMINISTRATIVE BLOCK and OUT-BUILDINGS, are requested to send their names to

the Architect, Mr W. Y. HOBBISS, Clarence-road, Southend, not later than MONDAY, the 4th MARCH.

Plans and specifications may be seen, and bills of quantities obtained (on payment of £1 is, which will be returned on receipt of a bona-fide Tender) on application to Mr. W. Y. HOBBISS, on and after MONDAY, the 11th MARCH.

The Corporation invite TENDERS for the above WORKS, and the same sealed and marked "Tender, Sanatorium Buildings," may be delivered at my Office not later than FRIDAY, the 22nd MARCH at FIVE o'clock p.m.

The Corporation do not bind themselves to accept the lowest or any Tender. By Order,
 Southend-on-Sea, WILLIAM GREGSON,
 February, 29th, 1895. Town Clerk.

COMPETITIONS. TO ARCHITECTS.

DESIGNS and ESTIMATES are invited by Mr. N. MILLER, of 95, Fishergate, Preston, Lancashire, for a proposed fireproof block of Shops, Offices, two fully-licensed Houses, &c., cost not to exceed £50,000, on an area of about 2,500 square yards.

Premiums of £150, £100 and £50 are offered (in the adjudged order of merit) for the three designs which are selected as the most suitable, and which three designs will become the absolute property of Mr. MILLER.

The assessor to be an architect of eminence, and familiar with commercial property.

A plan of the site, with instructions to Architects, can be obtained from Mr. MILLER, on payment of £1 is., which will be returned to those sending in bona-fide designs.

All drawings, plans, sections, &c., must be sent to the Borough Engineer's Office, Town Hall, Preston, the name and address of the designer to be in a sealed envelope, enclosed with plans, &c., which will be respectively numbered, but no name, device or motto must be visible on wrapper. The plans must be sent in not later than May 27, 1895.

CHORLTON UNION.

TO ARCHITECTS.

The GUARDIANS of the Poor of the CHORLTON UNION invite COMPETITIVE PLANS for the Cottage Homes and Schools about to be erected by them at Styal, Cheshire. The Guardians offer a premium of £75 for the plan adjudged first in order of merit, £50 for the second, and £25 for the third. Sealed plans, with estimates, must be sent to me not later than Saturday, April 20, 1895.

Full particulars of the requirements of the Guardians and conditions of the competition will be supplied by the undersigned upon a deposit of a fee of £1 is., which will be returned on the receipt of a bona-fide design.

DAVID S. BLOOMFIELD,
 Clerk to the Guardians.

Union Offices, All Saints, Manchester.
 February 22, 1895.

BOROUGH OF PENZANCE. TO ARCHITECTS.

The Town Council is prepared to receive COMPETITIVE DRAWINGS for the erection of an INFECTIOUS DISEASES HOSPITAL at a cost of about £3,000.

Premiums of 30 Guineas, 20 Guineas, and 15 Guineas are offered in the order of merit for the three plans which are adjudged by the assessor to be the most suitable.

A tracing of the site, with levels marked thereon, also "Instructions to Architects," will be supplied by the Borough Surveyor, on payment of One Guinea, which will be returned on receipt of Competitive Drawings.

The Drawings, marked with a motto or device, and accompanied by a sealed envelope containing the name and address of the designer, are to be delivered at the Borough Surveyor's Office, Public Buildings, on or before TUESDAY, the 19th MARCH.

January 16th, 1895.

T. H. CORNISH,
 Town Clerk.

The Builders' Journal.

Imprudent Millions. THE Prudential Assurance Company, Limited, has held another yearly meeting, and the figures disclosed are assuming such gigantic proportions that a little light thrown upon the dark waters of this amazing Industrial affair will do no harm to the British worker. As an illustration of the magnitude of our operations, said the chairman, and the care exercised in the selection of our business, I may mention that we paid last year no less a sum than £52,000 for medical examinations and reports. Our chief office staff consists of upwards of 1,100 clerks, of whom 290 are ladies. The latter assist in writing out the policies, and are clever correspondents, as many as 2,300 letters per day being often written by them. We have 670 copying books in use, and over 18,000 letters, notices, and parcels are sent daily through the General Post Office, who send six sorters daily to sort the letters and obliterate the stamps attached to the correspondence. Our postage at the chief office alone costs us £18,000 a year, and our stationery £27,000; and if I chose to go into minor details I could tell you the weight of brown paper, string, and sealing-wax we consume annually. We have also 60 calculating machines in use—not the old-fashioned ones invented by Babbage 60 years ago, but beautiful instruments, capable of solving long sums in multiplication and division. These figures, however, are lilliputian compared to the more financial details, for the "report" presented, showed that in the ordinary branch the number of policies issued during the year was 61,744, assuring £6,282,120, and producing a new annual premium income of £339,957. The premiums received were £2,077,956, an increase of £223,586, and the claims were £518,131. In the industrial branch the premiums were £4,244,224, an increase of £272,360, the claims being £1,548,377. The number of free policies in existence granted to those who have discontinued their payments is 398,078. The average duration of the

policies in this branch is nearly seven and a half years. The valuation shows a surplus in both branches of £1,326,047 (including £460,000 brought forward), of which it is proposed to distribute £576,047 and carry forward £750,000. The assets amount to £21,213,805, and include £5,000,000 advanced upon rates, £1,800,000 upon Indian and Colonial securities, and upwards of £2,000,000 each in Consols, railway debenture stocks, freehold ground-rents, and mortgages. If the income which is derived from the Industrial branch be added, the total in-

come is brought up to about £6,300,000. Now £6,300,000 means a weekly premium income of £120,000 or say £20,000 a day. These figures and sums are the more astounding when one discovers that the whole gigantic fabric is built up of pennies. The penny is the item of the Prudential Assurance Company. It insures one out of every four persons in the United Kingdom, and an enormous majority of its policies are of the penny a week premium. We have taken the trouble to collect these figures first hand, and also this astonishing—and what

we shall call an iniquitous—fact, that although 60,000 policies are issued every week, 35,000 policies lapse during the same period. Hence, the millions. The way the business of this company is worked is extremely simple, or it would never have entered into the brains of Messrs. Lancaster, Dewey, and the other gentleman, who laid its foundation stone in a room near Ludgate Hill some forty years ago. The Prudential Assurance has thousands of agents dotted over the country, and these agents devote nearly the whole of their time to the business of the Company. In hun-

dreds of villages the brass plate on the door of the Prudential agent is the only brass plate to be seen, and these men think nothing of sending up hundreds of application forms a month for policies on the lives of children upon which the premium is one penny per week. At a glance the whole system can be grasped, and how easy it is for a man gifted with "the gab" to induce hundreds of persons to insure their infants when it only costs a penny a week. That the insurance itself is beyond the merest suspicion goes without saying, the Prudential has been known to do many kind and just deeds in its career, but the fact that 35,000 policies a week are lapsed is the reason, and the only reason, for the accumulated millions of the Prudential Assurance Company, and in our opinion it is time that some of those millions were distributed among the policy holders, or some other system introduced whereby 1,820,000 persons no longer pay one penny a week into the coffers of an insurance company, and eventually, by their own inability to continue the payment, lose the benefit of what they have

paid. The mere fact that there are 398,078 free policies in existence, "granted to those who have discontinued their payments" weighs with us as a feather. Every single policy among those tens of millions that are lapsed should have had some surrender value, or some value as a permanent free policy. If not, then the whole thing becomes a game of "spoof;" and the humble—the world inspiring—penny is building up millions which would be better administered by the State. We shall return to the subject in more detail.

Where the Mother of Parliaments fails.

THE Report of the Select Committee on the Unemployed is dull, formal reading. We do not believe in Select Committees upon anything. They "report," and they have done. In fact, they are more select—using that word in another sense—than serviceable. There are so many classes of "Unemployed." The builder has been unemployed this winter; so, too, has the architect, for the season has been dead against building and more than a few men of acknowledged eminence have had reluctantly to reduce their staffs. The hod-carrier and the mason's labourer have not had the complaining all their own way. But Select Committees only interest themselves in the daily bread and manual worker side of such questions, and we are not aware that the "professions" are even "called." Yet, as a matter of fact, quite a number of the "professions" could give some startling evidence, but we will divulge no secrets, contenting ourselves by the jejune remark that everything seems overcrowded. More forcibly, we might say that the unemployed problem can be put into plainer phrase: there are too many people. We do not doubt but that the Select Committee aforesaid, went diligently to work, carefully digging up and arranging in rows no small display of facts, and carefully shutting its eyes to the vital truths which stand revealed, once the mere scaffolding is pulled down. Unfortunately, on these Committees, we rarely, if ever, get beyond facts and figures. Mr. Keir Hardie, M.P., whose methods we do not admire, but whose facts sometimes live and breathe, gave the gist of the situation in one of his speeches last week. He had verified the one "million unemployed" theory that so startled Lord Rosebery and politicians generally, and ended by startling them. In Bradford, said Mr. Hardie, on the authority of a committee of trade unionists and others, 55,000 men, women and children are bordering on starvation. Reports from Leeds, Liverpool, Manchester and Glasgow, paraphrase the same tragedy. Mr. Hardie makes bold to double his former estimate and defies contradiction. We think it more than likely that his original hypothesis, at least, is true. Two millions would be too terrible. If there be two millions, the problem is all the harder to face. Yet, in full consideration of the evidence, the Select Committee cannot bring itself to recommend or endorse any of the schemes suggested for the alleviation of the distress. We will not enter upon the larger and more controversial issues locked in the pet schemes of this or that theorist. The schemes may be bad, improvident, impracticable. They may be day-dreams or nightmares; the wishy-washy philanthropy, on the one hand, or the ensanguined outcome of Socialism, on the other. But, after all the barren business of committees and commissions, this seems to us clear and worthy the resolute attention of those with any power of sympathy left in their hearts—two millions of people, or one million, or half a million, cannot be allowed to die by gasps, starving in their sheer inability to earn the pittance that spells food. We are aware, we do not need to be told, of the loafers who contaminate the rest. It is the business of those who would re-adjust present day conditions, to sort the sheep from the goats, to recognise the people who will work from the people who will not. Even the wives and children of those who *will not* cannot be permitted to perish. But the people who *will*, and claim immediate thought and immediate help. In the great industrial hives of the North, in this dense-packed, wonderful city, so cruel to its poor, in beleaguered agricultural districts, where the labourer is turned away by the impoverished farmer, the cry goes forth that people are suffering; that even, in a matter-of-fact and

somewhat murderous end of a century, there are those too proud to speak aloud of their misery, too high-souled to scramble openly in the market-place for bread. No Select Committee will ever reach these; their evidence will never be "called." It has struck us that their voices are as the voices of the dumb—inarticulate, confined, at best a moan. No Select Committee need have been called to result in so negative an answer. The time for "regret," however sympathetically expressed, has gone by, yet there is the danger, too, of impulse, of excitement—neither desirable, if this question is to be broadly, calmly fronted. Not by the clashing of arms and the confusion of issues will the remedy be found, but rather, to our thinking, in those brighter, younger countries, which are still Britain in allegiance if not in name. There is the opportunity of all opportunities, the chance for the statesman who is not content to remain the politician; the germ of that Imperial idea which would lessen our own kingdom's necessities and responsibilities, and restore some measure of prosperity to the thronging, hustling masses who overcrowd the labour market. A happier ray of hope than any in the Select Committee's report, is the coming spring and summer. Nature gives temporary relief at least, succeeding where the Mother of Parliaments fails.

Cast Iron "Art."

A LITTLE straight talking on art school matters is sorely needed, and, once uttered, should do good. We are very much in agreement, on many points, with Mr. E. R. Taylor, head master of the Birmingham Municipal School of Art, who spoke some weighty words to the students of the Burslem School of Art, last week. Art school teaching has indeed suffered, as Mr. Taylor says, in common with general education from the mistaken notion that it is only a process of cramming. "Payment by results" has indeed been the result; a system "testing educational work by the pound and yard, which had so marred, degraded, and crippled the teaching power of the country, that it would be several generations in recovering from its ill effects." This utterance is deliberate and grave, and it should make certain dogmatists pause. Mr. Taylor's sympathies and our own are all against that "cast iron system" of which he complains. The teacher's love of his pupil has been the salvation of many an art student, for individualism is a truth in art as well as a trade secret, and military-like uniformity is the Juggernaut that crushes the weaker beneath its wheels. Mr. Taylor's address was so forceful and pregnant of import, we must quote a few of his concluding sentences. Having spoken in favour of the teaching of design in conjunction with the earlier studies of pupils, remarking that to defer exercises in invention and design was like forbidding a man to enter the water until he could swim, he observed "that there had been a great movement in the direction of dual teaching recently, and he wished it were possible to compare the exhibitions of the national competition of the last few years with those of twenty years ago. He attributed the hindrances to work in the past, and to the further development rendered necessary, to parasites which clung to the living organism. It was not known who they were, but the ill effect of their work was felt; they knew nothing about education, and as much about art." We should all like to hear of the extermination of these "unknown" parasites.

New day and Sunday schools are about to be erected in the Christ Church parish of Colne, at an estimated cost of £2,000.

The Builders' Journal COMPETITIONS.

TO COMPETITORS.

THE drawings for the first of this series of Competitions must be delivered to our offices not later than Monday, the 25th inst. The drawings must be submitted under mottoes, and sealed envelopes containing the motto used by any competitor, and his full name and address, must accompany them. In the issue for the following day, Tuesday, March 26th, the name of the Professional Assessor will be announced and also the full details of the Second Competition.

ITALIAN GOTHIC.

A PERSON accustomed only to that special and beautiful Gothic of which this country possesses so many noble examples, would at first feel disappointment on beholding St. Petronio, Bologna, St. Antonio, Padua, or any other Italian church. In them he would in vain look for that picturesque multiplicity of parts and strong contrasts of light and shade produced by the congeries of moulding and profusion of tracery with which the modern Gothic abounds. He would, perhaps, consider as bald the large uncut planes, ornamented by surface decoration only—such as mosaics or frescoes. Then, again, the immense span of the pier-arches, and also their height relatively to that of the partition walls, leaving no room for a triforium, or even a proper clerestory; the great breadth of the aisles themselves compared with their length, the absence of large windows for the display of tracery; and the stiff foliage of the capitals, too vividly calling to remembrance the Classical types—all these features which are characteristic of Italian architecture can hardly fail to create disappointment at first. But what seems most extraordinary is, that English architects should so hastily criticise these buildings, forgetful that their own conceptions of the beautiful are thereby exposed to the danger of censure; and it is still more strange that some should even assert of Italian Gothic that it is an imitation, but a most contemptible one, of the Northern Gothic. Surely we cannot suppose that men of undoubtedly great minds, many of them universally acknowledged as having excelled in painting and sculpture, could have produced buildings—and these, too, almost unmatched in size—differing so entirely and so systematically in many respects from those of the Northern Gothic, if they were all the while attempting to imitate them. Is it not more reasonable to conclude that those peculiarities which have been by some so readily styled faults, were, in fact, the results of a perception of beauty in the architects different from ours, but not the less true? Can we not conceive that architectural excellence may lie equally in the boldness produced by simplicity of ornament as in the variedness consequent upon the multiplicity of parts? Is the mystery of the Northern Gothic, by which the mind is kept in a state of unsatisfied curiosity, alone to be sought after, while the repose resulting from a complete comprehension of the design is to have no claim upon our regard? In fine, must we not admit that, as in individuals, excellence may exist as well in one combination of mental qualities as in another, so also it may be found in different architectural productions, which are the lasting impressions of the collective minds of the age and country to which they belong?

THE WORK OF THE SURVEYORS' INSTITUTION.

A CHAT WITH MR. JULIAN C. ROGERS.

A VERY remarkable Institution, winning its success in a quiet way, is the Surveyors' Institution. For more than a quarter of a century it has been steadily progressing, until to-day, it can be described—and this in no fulsome phrase—as one of the most solid and satisfactory organisations in London; one with its ramifications through the length and breadth of the land, keeping in touch with its members by a clever system of intercommunication, answering queries, obtaining information, and generally acting the part of Alma Mater to surveyors, land agents, and land valuers, many of whom are also engineers and architects.

One day last week, I mounted the stairs of the Medical Examination Hall, in Savoy Street, to find Mr. J. C. Rogers, and to have a look at the 200 busy candidates who were tackling their five days' examination to win associateship or fellowship, as the case might be. Performing a minuet over drawings, compasses and "T" squares, and being as oblivious to the work in hand upon the innumerable little desks, as friendly interest would permit, I gained the desk where the secretary sits with his assistants, superintending the conduct of the examination.

Mr. Rogers is a busy man, for he is editor of the "Transactions" and manifold publications, as well as secretary to an institution now numbering 2,500 members. He is so full of the affairs of the day, that he looks a little astonished when I enquire his birthplace. Presently, I hear of Farnham, Surrey, and that he is the nephew of Professor Thorold Rogers.

"Tell me, Mr. Rogers, what it is at which your institution aims? What is your guiding principle?"

"Our principle is to be practical as well as theoretical, intensely practical, I might say, and our examination system is addressed to the purely practical aspects of the three classes of land agents, valuers and building surveyors, into which, speaking roughly, the membership is divided. We place great reliance upon 'scale' work. The good results, not alone to surveyors, but also to architects, are inestimable. You see, on this sectional plan, a number of the little square desks are coloured red. All the occupants of these are men studying to be land agents. I find that the men who come up from the country, in the majority of cases, intend to become land agents, but you must not describe this as a hard-and-fast rule. Some candidates have a bent for the architectural side, and others for the financial side—valuing. I generally find that what you would describe as the 'cute fellow,' more particularly if he be a London man, goes in for valuing. You see there is so much scope in London; the area is so wide. The little "blue" squares on my plan are taken up by men who are going in for valuing, while the "yellows" take building, surveying, and quantities."

"Have you a preliminary?"

"We have, which students may enter when they are eighteen. When the time arrives for them to try for their Associateship, a studentship is of use in this way: those who have been students pass with 500 out of 1,000 marks; non-students 700 out of 1,200."

"Then you set non-students the stiffer papers?"

"We do; we desire all candidates to become students. An associate over twenty-two years of age may go in for his Fellowship, but we do not debar non-associates, only the

examination they have to pass is of a very high standard indeed, the percentage of marks being 1,200 out of 1,500."

"Your percentage of passes?"

"About 70 per cent."

"That is very good. Now, tell me, Mr. Rogers, whether your institution undertakes the preparation of students, 'coaching' them, so to speak, in any way?"

"Not in the least; they make their own arrangements. Much of the work is done by correspondence. Now, I believe there is a lot of cant talked against this so-called "cramming" system. A student is bound to have help; look, otherwise, at the diffused, mis-spent energy! The subjects are so wide and comprehensive, sound guidance is absolutely necessary. Many a student is unable to obtain this near to hand; he has to go afield. Of course, we supply candidates with a syllabus so that they may have a good knowledge of the range of subject to be attempted; we suggest text books also. I should like to make it clear that all our candidates are examined in practical land surveying. We open our examination by test work in Lord Jersey's park. You would like to have a list of our subjects? Well, it is a long list. There are nearly forty subjects for the various branches but I might briefly

MR. JULIAN C. ROGERS.

indicate to you a few. For instance, a paper on agricultural chemistry is submitted to the more advanced; construction and arrangement of farm home-steads is a subject upon which we lay stress; we have a very strong paper on quantities; the law on land and arbitration matters; levelling; field work, so on—you might fill a considerable space with a list of subjects. Of course the subjects are assorted according to the aims of the three classes into which we break up candidates."

All this was highly interesting. *Apropos* of nearly 2,500 present day members, Mr. Rogers told me he could remember the time—14 years ago—when two candidates only sat down to attempt the papers. The Institution, like the oak, has from the acorn grown.

Now the Institution is wealthy and opulent with a fine reserve fund and the intention shortly, to erect a commodious building of its own. The valuable transactions the Institution publishes from time to time, and the whole library of attendant literature that it issues to its members is the highest testimony to the usefulness and universality of the scheme. I asked Mr. Rogers to give me a hint of the way in which the Institution keeps in touch with its members.

"For instance, we get a query," said he,

"that query is at once set up into type and proved. We send proofs to some half dozen members who we know are authorities on that particular question. We have a list of men and subjects. We ask them to do their best to answer the question, or to name to us some likely authority or source wherein it may be found. Within twenty-four hours we get answers from say three out of the six. These, too, are set into type, and the answer or series of answers is sent to the enquirer within forty-eight hours of the receipt of his letter. More than this, query and answer are printed in the Issues of the Institution, and in this way we obtain a valuable and interesting record of points that have cropped up in the course of practical work. Then we promote our members to positions of responsibility on the Council, election being a matter of ballot, so that we are kept entirely in touch with all who have ever passed the examinations and become associated with our organisation."

"And your Council works well?"

"It works admirably, and to its efforts may be attributed the marvellous success we have had."

"Has not the Institution been of great service in shaping the new Building Act?"

"Yes. The opposition to the Bill cost us about £900, but the result has more than justified the expenditure. The Act may be regarded as a good working measure, though serious defects will no doubt reveal themselves as time goes on."

On the whole, the impression left upon my mind by my hurried interview with the busy Secretary was, that here, at any rate, is a professional Institution, alive at every point, and managed by a governing body possessed of rare sagacity and practical good sense.

PROBATE was granted on March 11, of the will of the late Edward Graham Paley, F.R.I.B.A., architect, Lancaster, of the firm of Paley, Austin, and Paley, the eminent ecclesiastical architects, who died January 23, 1895. The net value of the estate is set down at £71,939 1s. 4d. The testator bequeaths the whole of his household effects, plate and other articles of value, horses, carriages, stables, &c., for the use of his wife, together with the house at The Greaves, Lancaster, and after her decease for the use of his two unmarried daughters (Frances Emily and Mary Elizabeth). To his only son, H. A. Paley, a partner in the firm, he bequeaths the whole of his office property and effects, books, and instruments. The residue of the estate is placed in trust, from which the widow of the deceased is to derive £800 per annum, his four children deriving equal benefit from the remainder. He bequeaths £100 each to his grandchildren, and £100 to a god-daughter. £100 is also left at the discretionary disposal of the Lancaster Charity Trustees, except for which the whole of the bequests are of a private nature.

We understand that the Right Hon. Lord Cross has consented to lay the foundation stone of the new church of St. Lawrence, on the afternoon of Monday, April 22. Lord Cross, who was a very old friend of the late Mr. C. R. Jacson, is now connected with the district through his inheriting the estates formerly in the hands of the Misses Cross. Lord Cross will be the guest of the Ven. Archdeacon Hornby.

An enormous gas engine has just been fixed at the works of the Swan Field Shed Company, Limited, Colne. The engine has a maximum of 280 horse-power, and is the largest single cylinder gas engine in this country. Until within the last few months it might be said to be the largest in the world, but recently, in France, one of somewhat larger dimensions has been built. The engine is to work 720 looms.

THE estate of Toddington, in Gloucestershire, now in the market, presents a combination of the mystic number seven. It has been 700 years in the same family, consists of 7,000 acres, and includes 700 acres of fruit farms.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
19th March, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

THE quaintness of our big towns is disappearing, and each building season witnesses the demolition of that picturesqueness—old style—for which we confess to a sneaking fondness while we admire the architecturally spick and span structure upon which some art and much labour have been spent. Old Liverpool would seem to be going the way of Old London, and in a little while nothing will be left, save evil-smelling uninteresting slums. We hear that the block of warehouse property at the corner of James Street and Back Goree, one of the most ancient corners in Liverpool, and now owned by Mr. T. H. Ismay, is to be pulled down and replaced by a handsome suite of offices, for which designs have been prepared by Mr. Francis Doyle, architect. Beneath these buildings it is said is a subterranean passage some fifteen feet wide and eight feet high, extending to the site of the old Tower of Liverpool at the foot of Water Street, and in the middle ages connecting that stronghold with the Royal Castle at the top of James Street. On these grounds, when the site for the new block of offices comes to be excavated, some interesting discoveries relating to the town in the middle ages are anticipated. Here is the *scenario* for a breezy romance.

At the ninth sessional meeting of the Historic Society of Lancashire and Cheshire Mr. Gregson read a paper, prepared by the Rev. A. W. Wall, on "Sefton Church," near Liverpool, the church dedicated to St. Helen, which is a very ancient one. When the first church was built is not known, but it is supposed to have been built early in the twelfth century, for in 1204 the vicar had a dispute with the monks at Lancaster. The early church was supposed to have been supplanted by a Norman perpendicular church in the thirteenth century, since which time it had received such considerable alterations and additions, principally in the fifteenth century, that only small portions of the ancient church could be traced by the Norman workmanship and masons' marks.

THE forthcoming Art Loan Exhibition at the Guildhall will be strictly confined to about eighty works of the British school, a few fine examples of J. L. Gerome, and about forty celebrated works of the Dutch school. Fully twenty of the latter have never before been exhibited in a public gallery. The present permanent collection was closed yesterday, to allow for the reception and hanging of the new pictures. On Saturday, the 20th prox., the Lord Mayor will open the forthcoming exhibition.

ONE of the objects of the scheme propounded by the London Polytechnic Council

is the creation of branch technical institutes affiliated to the larger polytechnics. At these establishments special attention will be devoted to local industries, and their management will be conducted on lines similar to those adopted at the Herod's Institute, Bermondsey.

FREE lectures are not always the better attended because they are free, but the course instituted by the Carpenters' Company should commend itself to all industrial workers. The annual series is now being held on Wednesday evenings, at the Company's Hall, London Wall. These lectures, as in past years, appeal particularly to those connected with the building trade, but such names as Sir E. Leader Williams, Professor Banister Fletcher, and such subjects as "The Works of the Manchester Ship Canal," and "Coloured Decoration in Architecture," &c., make this year's course highly interesting to a much larger public. Architectural students, generally, would do well to attend these lectures.

THE volatile, voluble Frenchman, M. Lacroix, of Hastings, the case against whom was pending when we went to press last

week, continued his unconscious humour in the Queen's Bench Division on Monday. The defendant spoke in broken English which neither the jury nor anyone else understood. At the conclusion of his remarks his lordship humorously remarked, "Have you anything more you wish to say or swear to?" "Ah, yes," said the defendant, after a pause, and proceeded to enter into details that were not stated on the pleadings, whereupon he was stopped by the judge with the remark, "Oh, that is all nonsense." His lordship also told the defendant that he had done wrong in sending him (the judge) a telegram on Saturday, and that if he (defendant) were not a foreigner and absolutely ignorant of the procedure in English courts, he (the judge) should not have condescended to reply to the telegram, although it was prepaid. Charles Jones, a solicitor, was called by the defendant, whose first question was: "Why did you refuse to act for me?" "Because I thought you had no case," was the immediate answer, amidst laughter. Later on the defendant charged the witness with not answering the questions, whereupon the judge said, "I don't wonder the witness does not answer your questions. You don't put a question which he can answer. You must

not chatter so much." But M. Lacroix continued to chatter, though this did not prevent him losing his case. His lordship, in giving judgment for Messrs. Gant & Slater, architects, of Hastings, who were awarded £250 damages, granted an injunction restraining the defendant from republishing the libellous letter complained of. As the defendant left the court he said he intended to publish the letter.

THE Metropolitan Gardens Association has offered to arrange the churchyard of St. James's, in Pentonville Road, as a public garden, at a cost of £500, and the Clerkenwell Vestry has agreed to maintain it. The Vestry has instructed its legal agents to apply to the Consistory Court for the requisite faculty. The churchyard, which is remarkable for being the most dismal open space in London, contains the grave of Joe Grimaldi—a strange resting place for a strange fellow.

THE show brought together by the members of the International Society of Wood Engravers, of which Mr. W. L. Thomas, R.I., is the president for the current year, has excited genuine interest and some controversy on the much vexed question of process work *v.* wood engraving. Wood-engravers feel great interest in a question affecting their status, and by this Exhibition they not only demonstrated their own individual capabilities, but challenged those who prefer process work to show anything like such artistic results. Nearly 300 "pulls" on India proof filled the cases in Stationers' Hall; extremely beautiful illustrations of the finest possible productions of the art of the wood engraver, and amongst other examples was the famous picture of London in 1851, drawn by Thomas Sulmon, and engraved in the studio of R. London, which cost £500. Mr. E. F. Donner sent many splendid specimens, including his Madonna and Child, with Saints after Andrea del Sarto; and his Bacchus and Ariadne, after Titian. Mr. F. Babbage contributed a good collection, notably "The Poppy," after H. Holliday, which illustrated the effect of a white line on a black ground as distinct from the copper method of a black line on a white ground. Mr. E. Nicholas sent reproductions of pictures by Wal Paget. Mr. A. Woof had an excellent example of work in "Tunnel Boring" (No. 148), after Mr. W. Hatherell, R.I.; and Mr. W. T. Smith, a masterly bit of work in No. 185, "Grandmother," after the picture by Lochart Bogle. Mr. J. M. Johnstone exhibited a large number of specimens of his work, chiefly faces or figures, but there were also amongst them delicately-executed scenes, such as the farmyard, where he had used a marvellously fine line. Mr. W. B. Gardner lent a proof of his engraved portrait of George Meredith, by G. F. Watts; and Mr. A. Thompson a pretty work, representing two lovers on the bank of a river. We quote elsewhere from the vigorous and well-timed letter of Mr. Joseph Pennell, on wood-engraving. No one regrets more than ourselves the gradual usurpation of wood-engraving by other and cheaper methods. But the utility of process and mechanico-reproductive work cannot be denied.

THAT biggest of big embankment hotels, with its portly face to the river and its unpleasant reminder of Jabez, still cries out for "more room." A special general meeting of the members of the Liberator Building Society was convened by Mr. Wheeler, the Official Receiver and Liquidator, and held at the Holborn Restaurant at noon yesterday. The object of the meeting was to consider and approve the Bill in Parliament designed to improve the property of the Society known as the Salisbury Estate, situate between the Strand and the Embank-

ment. Upon this estate have been erected large blocks of buildings which are specially adapted for utilization as a hotel, and which it is hoped will be opened for that purpose early next year. When this occurs the amount of traffic passing to and from the property will be very large, and having regard to the already congested state of the Strand, it is considered of great importance that the roadway of the Strand should be widened at this point. The present Bill has therefore been promoted to acquire the houses fronting on the Strand for the purpose of carrying out necessary improvements. Although this will necessitate the expenditure of a considerable sum, the Official Receiver is advised, and believes, that a large portion will be recouped by re-sale of the property acquired, and that the difference should be covered by the improved value which will be given to the rest of the property. This seems to us a cart before the horse arrangement. You build your building and reform your site. We presume the new hotel hunters to look down on the Strand.

THINGS are moving a little, even in Bethnal Green, where a new infirmary is to be added to the workhouse, the site already having been purchased. By the way, the workhouse in Bethnal Green is said to be the most backward in London, and the overcrowding is something appalling, the wards, which are certified to accommodate a little over 1,200 inmates, at present containing over 1,880. The guardians, however, have made arrangements with the City of London Union to take a certain number of the old people off their hands with a view of relieving the congested state of the building. One of the chief defects of the building is that there is no separate infirmary, but only sick wards in the main building. The guardians expect that the new infirmary building will be finished in about two years.

THE old "Town Hall," Sheffield, is to be elevated (and altered) to the dignity of "Court House." We trust the traditions of the old place may remain undisturbed. The extension will be made by the erection of buildings on 670 yards of land in Waingate, which has been agreed to be leased by the Town Trustees to the Corporation, at an annual ground rent of £240, for a term of 470 years, which expires at the same time as the lease of the site of the existing buildings. The new building provides for an additional court 53ft. by 33ft., about the same size as the existing large court, and similarly arranged and furnished in oak, having a large corridor for waiting witnesses, a solicitors' room, and a room for consultation, all on the ground floor, entered from the far end of the existing ground floor hall. Additional offices are also provided for the Stipendiary Magistrate and the magistrate's clerk, and a large room, about the same size as the present grand jury room, is provided for the magistrates. The magistrates' entrance from Waingate is to be enlarged and made more important, and is to have an entrance hall and improved staircase. Under the court there will be cells.

THE ventilating arrangements for the new building provide for 3,000 cubic feet of fresh air for each person per hour, which is the recognised maximum quantity requisite to maintain the normal condition of purity. It

is to be heated when required by hot water pipes in the basement, mixed with cold air to the required temperature, and driven by a fan into the court and other rooms. The foul air is to be drawn out by another fan. The chief constable and the architects have visited the most recently erected courts and police cells in the kingdom, and have advised the repeating of the arrangements of the old Sheffield courts in the new one, especially as to the position of the prisoners' dock at the side; and, with respect to the cells, the only improvement on the old ones which they have seen is the substitution of glazed brick surfaces for white-washed walls. The architects, Messrs. Flockton & Gibbs, estimated the cost of the building to be £17,000. The Watch Committee recommend the acceptance of tenders amounting to £15,684, including buildings, heating and lighting, and all the permanent fittings. The design of the buildings is of the simplest character, both externally and internally, to harmonise with the existing building.

ARCHITECTURAL History is an absolutely vital subject, and yet one too much neglected by the young architectural student. Mr. B.

Priestly Shires, A.R.I.B.A., of Plymouth, is doing good service by his exhaustive and carefully expounded lectures, the sixteenth of which he recently gave at the School of Art in that town. Mr. Shires, in speaking of the Perpendicular period of English Gothic architecture, said that it was characterised by the exuberance and redundancy of its ornaments, and was wanting in that simplicity which was to be found in the decorated style. In the earlier examples this enrichment was not carried beyond bounds, but in later examples it became excessive, which proved injurious and at last fatal; and English Gothic began to decline from the commencement of the fifteenth century with the straining after perpendicular lines. Arch moulds were in many cases continued down the piers to the base-mould or plinth, or even to the pavement; consequently, neither capitals nor bases were much required, and this, Mr. Shires said, perhaps formed one of the many reasons of decay in the art. Where caps were introduced they generally took the same plan as the piers, and were so narrow from abacus to neck as to give to a casual observer the appearance of simply a

band or impost-mould. Foliage, like mouldings, &c., assumed angular shapes in outline, and also gave a conventional appearance.

THE perfection attained in the earlier styles, was not easily lost, and much of the ornamentation was well adapted and often very carefully executed. The wreath-like form of cap of the Decorated style was still adhered to, but the foliage was shallower and less true to nature, and throughout the whole period there was a squareness of outline observable. The mouldings differed much from those of preceding styles. They were in general more shallow, and it was a characteristic feature of this period to stop the mouldings on bases, or by the introduction of an ornamental stop. The hammer-beam roof was a feature of the style and fan tracery vaulting; some of the best examples of the style were the Choir of York, 1372—1403, Lavenham Church, Winchester Cathedral west front and nave, an illustration of which appeared in an earlier number of "THE BUILDERS' JOURNAL." There were also manhood examples as late as 1600.

OUR heart was wrung in a new way the other day, and we confess to the novel sensation. We had read the case of Fincher, who is a saddle-riveter, and cannot earn more than about £5 a week at this laborious occupation. The slave of toil agreed with an oppressor of the name of Betts to work for a fortnight, and got a sovereign in advance. After that he declined to fill his contract, and the employer had the heartlessness to summon him. The poor fellow had been out on strike (a man who cannot earn more than fifteen shillings a day must be expected to strike) and "wanted a sovereign," (a most natural and not uncommon want) and he got it on Saturday by promising to come to work on the following Monday; but with a fine spirit he admitted to the magistrate that he never intended to keep his promise. "But," said the magistrate, "if the money was a loan the lender could have sued you." Observe the simple manliness of this answer: "Defendant (laughing): I should have said I hadn't had it. He'd no witness, and I'd put my hand to nothing." Yet the

Bench ordered Mr. Fincher (though he has a wife and children to keep out of that miserable five pounds a week) to pay the sovereign with costs; and had the cruelty to hint that he would have to go to prison if the sovereign and costs were not forthcoming. Here is a new trade for other people's "boys." We commend it to general consideration, and we feel with Fincher, but the feeling is not of pity.

THE British Museum is suffering from the "universal depression," and so, we might add, are its "readers." The Trustees have laid a petition before the House of Commons through Sir John Lubbock. It recites that the only funds belonging to them "for the support of the British Museum" consist of £30,000 in Consols, returning £825 yearly, of a bequest from the late Earl of Bridgewater returning about £400, and another from the late Lord Farnborough returning about £80. "The establishment is necessarily attended with an expense far beyond the annual produce of the sums above-mentioned, and the trust cannot, with benefit to the public, be carried on without the aid of Parliament."

Accordingly, the House is begged to grant such further support as shall seem meet "for the general benefit of learning and useful knowledge." It is a request for a fixed annual charge upon the revenue, independent of special grants. We have been of the opinion for some time that Consols do not provide a visible means of subsistence. Surely the above proves it?

MR. SYDNEY BUXTON, M.P., in unfurling a new banner for the Western (London) District of the Amalgamated Society of Carpenters and Joiners, spoke of the strong interest with which he had viewed the development of trades' unions, and said that not only were the workers concerning themselves more and more in their own affairs, but the public generally was taking a deeper interest in labour questions. He did not believe that the country was in favour of the State arbitrarily intervening between capital and labour when industrial difficulties occurred, though much might be done towards conciliation in endeavouring to bring together the parties engaged in such disputes. He was of opinion that the extension of trades' unions was far more likely to make for industrial peace than for industrial war.

OF the £40,000 required for the rebuilding of the London Dental Hospital, about £11,000 has been already collected, but the greater portion of this, £6,000 at the lowest computation, has been subscribed by the dental profession. A considerable proportion has also been either subscribed by the students, or acquired through their exertions in organising entertainments. There is no prospect of the building itself being commenced until more funds are in hand. The site, which is purchased, proved more expensive than was at first anticipated, as it included a public-house. And though the estimated value of the present buildings for business purposes is estimated at something like £15,000, this sum, which would go so far towards making up the required £40,000, cannot be realised until possession is given, and this cannot, of course, be arranged until the institution has found another habitation.

THE new hospital for infectious diseases which has been in the course of construction at Flaybrick Hill, during the past twelve months, for the Corporation of Birkenhead, is spoken of as the completest building of its kind in the Kingdom. The building has been completed and furnished at a total cost of £17,400, and has accommodation for forty-four beds. In the entire work, Mr. Brownridge (borough surveyor and engineer) has been the superintending spirit. The site of the hospital has an area of about $5\frac{1}{2}$ acres, and varies from 83'0 feet at the entrance gates to 112'0 feet at the upper end above the level of the sea. The site is very open, and affords an extensive view over Bidston Moss and Wallasey. The buildings at present erected are the administrative block, isolation or private ward pavilion, three ward pavilions, laundry and disinfectant block, mortuary, and van house, giving accommodation for 44 beds; but there is room on the site to erect five additional ward pavilions, giving a total of 104 beds. Each of the pavilions and the administrative block front to the south. All the buildings (which have been put up by Messrs. Kelly Brothers, Walton) are of a plain, substantial character, of local grey bricks, with Ruabon-pressed brick strings and dressings. The main building is intersected by a corridor running the whole length of the building, on each side of which the various rooms are situated. Near the administrative block is the isolation or private ward pavilion, for the reception of private patients, or for treating cases the nature of which has not

already developed. It consists of four small wards, each of two beds; between each pair of wards is placed the nurses' room. The ordinary ward pavilions, of which there are now three, consist of male and female wards, each capable of accommodating six beds, and having a nurses' room between. There is also a receiving and bath room, in which the patient is received, and where the patient is also disinfected before leaving the hospital. Three separate classes of disease can be dealt with at the same time, giving two wards for each class of disease. A peculiar feature which Mr. Brownridge has introduced is the rounding of every angle and corner in the building, including ceiling cornices, door edges, window ledges, and, in fact, every place where ordinarily there would be a corner. This wonderfully facilitates cleansing. The sanitary arrangements are perfect, and the whole of the hospital is a model upon which others are certain to be based.

SIR JOHN TENNIEL is coming into "line" in the public rather than in the artistic sense. Whilst the other notabilities of *Punch* have shown the public their collected works in the medium in which they were made, Sir John Tenniel, the *doyen* of the staff and the most popular of all, has hitherto refrained from so doing. With a lively interest the announcement will be received that a selection of some 200 of the famous *Punch* cartoons will be exhibited at the Fine Art Society's, New Bond street, on and after the 30th inst., where, later on, will also be seen the works of the youngest member—Mr. Phil May.

It must be admitted that there is architecture in dress, especially in woman's. We wonder if the "profession" will reel, if we class the late Mr. Worth as an architect. At one time a Burgess of South Lincolnshire, he was subsequently the most important man in Europe, ruler of Fashion, that bigger empire than Russia. The Empress of the French never set out for a function of State until he had approved her costume, and Queens used to spend long hours in his consulting-room. We may look at his life from two very different standpoints. On the one hand he was industrious and obliging, and came to a fortune because of his strict attention to business. On the other hand, he was the great artist who insisted that dress should be something more than a mere wrapping—it should be sumptuous in style and at the same time expressive, or at least indicative of a personality. This was the secret that made Worth's a name of power.

HERE is a point for property owners and individuals who hold head leases. Mr. Justice Stirling has decided that they must not play "chemin de fer" at the "Argosy Club," for fear of endangering the head lease, which makes the playing of "unlawful games" on the premises a cause of forfeiture. The proprietor of the club argued that "chemin de fer" was not an unlawful game, but it has been made clear to his lordship that "chemin" is nothing but a variety of the evil thing "baccarat," and so an injunction is to issue. The judges come by some curious learning in the course of their experiences on the Bench. Here is a grave and dignified Chancery judge compelled by circumstances to master all the technicalities of the West-end gambling houses. Mr. Justice Stirling found it convenient to take from the middle of February to mature his judgment.

THE case between the frozen-out householder and the irresponsible water corporations and companies is worth emphasis. The water companies lay down their mains as they choose, and also the pipes that connect these with the water systems in each house,

at the cost of the owner of the house, but still according to their own scheme, allowing him no voice in the matter. They do the work and he pays for it. It seems to be ascertained scientifically that frost will not penetrate below a depth of three feet—at least not such frosts as visit this temperate climate. But in any case it is quite possible so to sink the mains that the water in them should have complete immunity from congelation. As a matter of fact, these mains are not always sunk to the depth of three feet—are sometimes not sunk to anything like that depth. Still, being of large dimensions and with a constant volume of water flowing through them, their risk is not so great. But the smaller pipes connecting these with the house cisterns are both more exposed and offer less resistance to cold, and in such frosts as we have had last month, get frozen and burst. The company's water is wasted, and the company have their remedy carefully reserved to them under their Acts. As they made the mistake (at the cost of the owner of the house) so they are allowed to repair it—at his cost also.

THE London Building Act would seem to have fallen into immediate disrepute. Even Sir John Bridge, who rarely goes out of his way to be denunciatory, can see no wisdom in it. He holds it unintelligible in most places and ambiguous in the rest. He therefore gave judgment against it. He found that the buildings of Messrs. Shoolbred, about which the case arose, are rather offices than warehouses. But that was not the surveyor's point, for he admitted that. His real point was mathematical and concerned "diagonal lines, horizontal lines, and a reference to $63\frac{1}{2}$ degrees." Possibly it was a question whether the line drawn from the extreme back line of the space behind the proposed building to the top of the said building, does or does not make an angle with the ground of $63\frac{1}{2}$ degrees at most. If it makes an angle of that, or less, the air space at the back of the building is obviously more than if it makes an angle greater than that.

It is a pity that Mr. William Allan, the latest "marine boiler" authority, speaks so rarely in the House of Commons. His speech, on the apparently unattractive subject of water-tube boilers, was a bright spot in an otherwise sober evening. The few members who were in the House at the time obviously enjoyed the unexpected interlude, and whenever Mr. Allan showed signs of stopping cheered him on. The interest of the member for Gateshead in the subject of boilers is two-fold. In the first place he is by profession a maker of marine engines and boilers, and secondly, he has the recollection of a youth spent in the engine-rooms of blockade-runners in the American Civil War.

SOME of the slums in the sanitary district of St. Pancras are centres of disease and veritable plague-spots. The death-rate in Somers Town is higher than at any other part of St. Pancras. It has been recommended by a specially appointed Committee that the Housing of the Working Classes Act should be put in force. Mr. Purchase held that the County Council had proved wholly indifferent to the public health of St. Pancras for two years. The state of this Somers Town area, particularly Church Way, was a scandal to any public body professing a zeal for sanitation. From this plague-spot in central London disease had spread to other parts of the Metropolis. A resolution was adopted at a meeting of St. Pancras Vestry "protesting against any continued delay in the furtherance of a scheme for the improvement of the Somers Town area."

A COMPETITION, promoted by the German Emperor for the encouragement of German sculptors, is hardly one which lovers of antique art can view with equanimity. A prize of two thousand marks is offered for the best restoration of the "Dancing Maenad" in the Old Museum of Berlin, and competitors are expected to replace "all the antique parts" which are missing in the fragment. The preliminary attempts of the restorers are to be made upon casts, which are to be supplied to them at a fixed price, but there seems a possibility that the prize winner may be allowed to exercise his ingenuity upon the original figure, which has already been tinkered more or less ineffectually. No protest against any such foolish misapplication of artistic capacity can be too strongly worded or expressed. We should not be surprised if the German Emperor succeeded where even Barnums fear to tread, but we cannot admire his recent footprints in Art matters.

ROTHERHITHE is waking up, and will now wear quite a business air, for the erection of a new Town Hall and Administrative Offices has been decided upon. The present office accommodation for transacting the business of the Vestry is of a very poor description, and the neighbourhood is very much in need of a public hall where meetings and entertainments may be held. The scheme which the Vestry has adopted will provide these two things. The accepted design for the Town Hall is that of Messrs. Murray & Forster, Adelphi Chambers, John Street. There were six competitors. The style of the building in the main front is Italian Renaissance. The architects have arranged to place the public hall on the ground floor, with the main entrance towards Moodkee Street. The hall is 52 ft. 6 in. long and 38 ft. 6 in. wide, and the original plan shows a handsome corridor running round three sides, and provision for four emergency exits. The Administrative Offices of the Vestry are also on the ground floor. The Vestry Hall occupies the first floor, and is a handsome room of 50 ft. by 30 ft. There is a public gallery, and several rooms intended for the use of committees, and a coroner's court.

MANCHESTER figured prominently in a discussion which took place at the Sanitary Institute, London, on the subject of back-to-back houses. The subject was introduced by Dr. Niven, the medical officer of health for Manchester. He dwelt upon the various points in which houses built in back-to-back blocks violate hygienic principles, and described what the authorities in Manchester have done and are now doing in regard to them. His address—a careful and discriminating one—amounted in effect to a strong and practically unqualified condemnation of the back-to-back system. It was illustrated with graphic representations of various types of back-to-back houses met in practice, and the methods adopted for dealing with them. The excellent drawings, plans and sections used for this purpose were contributed by Mr. T. de Courcy Meade, city surveyor of Manchester. Sir Francis Sharpe Powell, M.P., who presided, paid a high tribute to Dr. Niven, and denounced it as a discredit to the Leeds Corporation, as well as a disgrace to Parliament, that legislative powers should have been sought and obtained so recently as 1893, to allow the further erection in Leeds of back-to-back houses, which he stigmatised as an abomination.

THE ceremony of laying the foundation stones of the hostel for women students in connection with the University College of Wales, Aberystwith, was performed by Lady Hills Johnes, who took the place of Lady

Aberdare, and also fulfilled a like function on her own behalf. An interesting procession was formed at the college, headed by the town band, and including the borough police and fire brigade, members of the College Council and Court of Governors, the Mayor and Corporation, the members of the school board, the governors of the intermediate schools, clergy and ministers of religion, teachers of secondary and elementary schools, the members of the college staff, and past and present students. The hostel is being built, at a cost of over £15,000, on Victoria Terrace. It will have a frontage overlooking Cardigan Bay, facing the west, and will be sheltered from the easterly winds by Constitution Hill, which rises some 500 feet to the north-east of the promenade. At present accommodation will be provided for about 150 women students, but as there are now nearly that number in residence at the temporary hostel, increased accommodation will have to be provided at an early date. Owing to the death of Lord Aberdare, the president of the college, the ceremony of laying the foundation stones was postponed to yesterday from St. David's Day, and yesterday Lady Hills Johnes, of Dolancothi, took Lady Aberdare's place in laying one of the stones, and also performed a similar ceremony on her own behalf. The other two stones were laid by the wife of Principal Roberts, on behalf of Mrs. Wynford Philipps, who had to preside over a Liberal women's meeting at Cardiff, and by Mrs. Jessie Williams, wife of the senior inspector of schools. After the ceremony, a public meeting was held in the assembly rooms of the temporary hostel, when Colonel Davies Evans, Lord-Lieutenant of Cardiganshire, presided, and speeches were delivered by Principal Roberts, the vicars of St. Michael's and Holy Trinity, Aberystwith, Lady Hills Johnes, Mrs. Williams, the Rev. T. Leevi, ex-Moderator of the Calvinistic Methodist Assembly, Mr. Vaughan Davies, Miss Carpenter, the lady principal, and others. It was stated that a grant of £2,000 had been made from the Pfeffer fund towards the building of the hostel, that the Corporation had given the site for a nominal sum, that the remaining sum had been borrowed, and that between £2,000 and £3,000 would be required for furnishing which, the speakers were confident, would soon be forthcoming.

PROFESSOR W. C. F. ANDERSON, M.A., lectured last week before the Sheffield Society of Architects and Surveyors, on "Some Early Christian Antiquities (unpublished)." The churches he described were those discovered in 1893 and 1894 by expeditions in which he took part. The first was a rock-cut chapel in a mountain side about two miles from the valley of the river Maecustus, and three hours' ride north of the modern town of Bigaditch, in Mysia (Asia Minor). It is in a projecting crag which hangs a couple of hundred feet above the valley below. The rock is tufa, and in this is carved a church, with porch, chancel, and apse, and a side chapel. In the porch there is a rock-hewn tomb, and a similar tomb is in the north wall of the side chapel. The church is very small, not more than 40 feet long from the door of the porch to the apse. Yet all the features of a large church are imitated in this restricted space.

THE seats for the clergy with the bishop's throne in the centre run round the apse, the chancel is separated from the tiny nave by a triumphal arch, and the side chapel has a diminutive altar and credence table. Three crosses still remain over the inner door, and a much mutilated wall-painting in the chapel showed that the church was originally decorated with emblems. The church is evidently an early one, but there seems to be

no certain indication of its date. Similar chapels exist in Cappadocia and other parts of Asia Minor. Above the church is a small cell, also carved in the solid rock, which was probably the dwelling place of a hermit priest who had charge of the shrine. The other churches were two discovered at the old Roman town of Doclea in Montenegro. The larger was a Basilica, with an apse, a vestibule and a large court. It was paved with mosaic and was decorated with many carved capitals, screens and windows. A large number of rudely carved stone crosses point to there having been a number of altars besides the chief altar. The foundation of the seats of the clergy and the bishop's throne still remained—as did the platform on which the high altar stood. The date of the church was probably a little earlier than A.D. 500. The second church was much smaller, and was in the form of an elongated octagon. An inscription recorded that it was built by a lady called Ansonia.

THE three excellent little sketches of the clerestory at Waltham, the oriel at Haddon Hall, and the cresting from the nave roof of Swainsthorpe Church, are by Mr. Frederick Chatterton, the late pupil and present assistant of Mr. John P. Lee, F.R.I.B.A. Mr. Chatterton can make a clean and pretty sketch, and has the faculty of getting his perspective extremely accurate, which more than redeems the lack of strength in his pencil drawings. We should like to see more of this young architect's work.

MR. EDWIN O. SACHS has sent us advance sheets of his "Modern Opera Houses and Theatres," which will really be a beautifully illustrated treatise on theatre planning and construction; with examples selected from play-houses recently erected in Europe, with descriptive text. The work will be in three volumes, 23 in. by 16 in., bound in buckram, and altogether there will be no less than 220 plates, most excellently lithographed by James Akerman. All references on the illustrations will be made in English, German and French. The only thing about the work that at all trespasses upon our ideas of fitness is its price of £15 15s. to ordinary purchasers, or of £9 9s. to subscribers. As an actual matter of fact, the price is a low one, but to architects in this country somewhat prohibitive. The publisher—Mr. Batsford—announces that the list of subscribers will be printed in each volume.

THE Sheffield Art Crafts' Exhibition, which closed on Saturday night, has done something to revive interest in what was thought to be a lost art in Sheffield—we refer to wrought iron work. The craftsmen on the staff of Messrs. W. Hutton and Sons, under the direction of Mr. T. Swaffield Brown, deserve special recognition. The copper plaques by Mr. Brown, illustrating various phases of British sport were much admired. Mr. George Halliday's exhibits included "The Jester," and "Perseus with the head of Medusa" after Cellini. "Cupid and Psyche," by Mr. R. Douglas, another member of Messrs. Hutton and Sons' staff, was a study in bronze, and a panel by Mr. G. Halliday in repoussé, "The Judgment of Solomon," was also an excellent example. Mr. Thomas Shepherd's plaque, "Blackberries," showed merit. The clusters of the enticing wild fruit were in high relief and the leaves and flowers traced with much delicacy. George Webster had a plaque in copper gilt, containing panels on which were chased flowers and foliage. The Master of the Guild, Mr. C. Green, designed and modelled a canopy for a stove, manufactured by Crosthwaite, of Thornaby, that represented "More, of More Hall, slaying the Dragon at Wharnclyffe." An appropriate letter was received by Mr. Green, from Mr.

E. Onslow Ford, A.R.A., the Master of the London Art-Workers' Guild:—"Dear Sir, this morning I received the Sheffield papers, and the account of the opening of your exhibition made me feel very sad that I was so unfortunately prevented from being present. I am so glad everything went off so well, and that the exhibition is such a success. I hope you will some day give me another opportunity of being present at your Guild. There is one thing I should have said, had I been with you, and that is if any member of your Guild should be in London at the time of any of the meetings of our Guild, I, as master, will be pleased to receive anyone presenting himself at Clifford's Inn Hall with your introduction. I am glad to say I am able to get about again, but am feeling far from well." This letter of Mr. Ford's is full of right feeling.

DR. ROWAND ANDERSON, architect, writes with reference to the construction of the proposed hotel and offices at the Waverley Station. The circumstances, he says, connected with the competition and the decision of the directors had been so extraordinary, that he thought an explanation was due alike to the competitors, the architectural profession and the public. Apart from the competitor whose designs had been accepted, five architects of established reputation were invited to compete, and he was justified in saying that they all devoted much labour and expense to the preparation of their plans. It was freely stated to himself and others that they might save themselves the trouble of competing, as the result was a foregone conclusion. It was now abundantly evident that the designs had not been carefully considered. By whatever process the decision of the directors was arrived at, it certainly was not reached by the only proper course of considering each set of plans in detail, and comparing them with each other. The directors could have entrusted the work of designing the building to any person they pleased, without going through the solemn farce of inviting designs. Having invited competition, they ought surely to have allowed a decent and sufficient interval for adequate consideration of the designs to elapse before announcing their decision.

THE PROPOSED NATIONAL INDUSTRIAL UNION.

AT a meeting of the provincial committee of the proposed Industrial Union of Employers and Employed, appointed at the preliminary conference, Mr. R. A. Hadfield, Sheffield, presided, and amongst others present were Messrs. Daniel Jones, employers' secretary, Midland Iron and Steel Wages' Board; T. B. Johnston, Bristol; W. L. Robinson, West Bromwich; Stuart Uttley, Sheffield; E. Trow, Darlington; W. Johnson, Warwickshire Miners' Association; and A. H. Quance, hon. secretary, employees' section. Reports were presented showing encouraging progress, and it was announced that the inaugural conference in London would be thoroughly representative. From the United States and elsewhere communications showed that the movement had aroused a keen and widespread interest in industrial circles. It was resolved that the provincial Committee was justified in proceeding to establish the Union, and it was decided to hold an inaugural conference in London in June next.

MESSRS. MURRAY & FOSTER's design has been selected for the new Rotherhithe Town Hall, the cost of which is not to exceed £15,000. The building consists of a vestry hall; committee room; public hall; clerk's, surveyor's, medical officer's and sanitary inspector's offices; with the usual accessory apartments and caretaker's quarters.

The Builders' Journal.

MEN WHO BUILD.

No. 6.

Mr. ROBERT W. EDIS, F.S.A.

EIGHT-AND-TWENTY years ago, Robert Edis called in his friend, Henry Stacy Marks—not then a Royal Academician—and between them they devised and executed the friezes that are one of the charms of the architect's well-known house in Fitzroy Square. In the dining room on the ground floor, which also serves as a reception room for those guests who can appreciate a collection of lovely china a little more perhaps than they can the working drawings of a new country house, are a goodly collection of Shakespearean proverbs. "The friends thou hast and their adoption tried, grapple them to thy soul with hooks of steel" is one of them; and another "Welcome ever smiles and farewell goes out sighing." It hardly wants, therefore, the manly physique and fine hearty voice of the Colonel of the "Artists" to put you on good terms with the delightful architectural drawings, which dispute with the Nankin china, the Etruscan pottery, and the Kaja ware, for pride of place in your affections.

"Terra-Cotta," or the use of it, has caused a mighty breach in the camps of architecture. Many there are, who say it is the damnation of art. Robert W. Edis follows Alfred Waterhouse in his opinions, and goes on using Terra Cotta from year to year; and like the great Master of planning, he has developed into a Terra Cottaist of a very determined nature. Were you to ask Mr. Edis why he uses Terra Cotta, he would perhaps put it, because it is absolutely the best material outside of granite or marble to withstand the climate of the country. He would no doubt ask you what you thought of the Certosa at Pavia and the beautiful examples of Terra Cotta buildings in northern Italy, and then he would—or could—go deeply into the question of the art side of the material and add many startling facts to a controversy over which you possess a perfectly open mind. Certain it is that the revilers of Terra Cotta will have to get in front of some remarkably fine buildings in London alone before they can establish their convictions. The Natural History Museum, by Mr. Waterhouse, is no doubt the finest, and had that building, as we see it now, been executed in stone, it would have merited but a very small atom of the praise one is glad now to shower upon it. Mr. Edis points out many requirements of good work. The blocks used should be small, and he does not believe in the artificial colouring of the clays. He thinks with you that there is an enormous amount of very inferior material—inferior in its manufacture—used, which should be rejected by the architect.

Robert W. Edis has hewn his way up the rocks of architectural practice, step by step, by his own intense personality. He was born at Huntingdon six and fifty years ago, of a good yeoman strain. The local Grammar School and the Brewers' Company School, at Aldenham, gave him somehow the germ of architectural appreciation, fostered straight

away by a London firm to which he was articulated. Being six feet two in his stockings he had the pluck at two and twenty years of age to get married, and begin practice in Lincoln's Inn Fields the same year. The following year (1862) he became an Associate of the Institute, and proceeded to full fellowship five years later. It was in 1859, however, that he struck a very lucky vein in joining the Artists Corps of Volunteers, and it is still a doubtful question whether the study of volunteering or architecture do not run side by side in his ambitions. During the young days of practice Robert Edis was steadfast in his work, allowing himself but one weekly visit to the Hogarth Club, where he gained the friendship of Street, Dante, Gabriel Rossetti, Robert Martineau, and Val Prinsep.

Early in his professional career, Mr. Edis joined the Architectural Association, worked

hard in its classes, metaphorically took his coat off and bared his arms when work demanded it, and naturally becoming its President a little later, was re-elected to serve a second year. During his years, Robert Edis has found time and inclination to do an enormous amount of travelling. He has shot big game in the Rockies; has laid low a king of the forest in Africa, has killed the Moose in Norway, and "floated" a fly over half the rivers in Europe. But wherever he went, with gun or rod, on shanks' pony, or on Arabian steeds, Robert Edis has always had a "canvas back" in his coat pocket, and when sport has failed, art has come in to make him recompense, and many's the time he has sketched a "spot" in revenge for the game he has not killed.

As an architect, Mr. Edis is known in London more particularly for his Senior and Junior Constitutional Clubs. The exterior marble work of the Junior, in Piccadilly, owes its existence to a very happy fact. A Norwegian once called on Mr. Edis to invite him to inspect some marble quarries situated on the banks of the Ofoten Fjord, and produced samples of the stone. Mr. Edis pronounced against the samples and refused the commission. Several years later, the quarry owner called again with another sample, from another quarry only just opened up, and Mr. Edis was delighted. He proceeded to Norway with all haste, and

NEW CONSERVATIVE CLUB, GLASGOW.—MR. R. W. EDIS, ARCHITECT.

the marble work on the elevation of the Junior Constitutional Club in Piccadilly is the result of his visit. He considers

A FLEET STREET FRONT, BY MR. R. W. EDIS.

the material equal in every respect to Pavanazzo, or any other of the Carrara brand, and the price is very much less. All over the country Robert Edis has done some of the best domestic work. He built Byrkley Lodge for Mr. Bass, he has added a wing to Sandringham, enlarged York Cottage for the Duke of York, and is the consulting architect to the Prince of Wales. The Inner Temple Library bears the impress of his art, but the greatest house he has up to now been engaged upon is undoubtedly the Georgian mansion he is building at Chevely for Mr. Harry McCalmont, which will contain one of the finest halls and galleries in England. The new Conservative club in Bothwell Street, Glasgow, which has been quite recently completed, and of which you are able to give a perspective sketch, is an excellent example of Mr. Edis's methods.

If you want to lure Robert Edis into a chat about matters outside the pale of architecture, you have to entice him into his own room in Fitzroy Square, and get him to smoke a cigarette upon his own hearthrug. He has no love for the rising eccentric school who are wasting themselves on architectural gymnastics and prostituting all the teachings of the ages. He does not love the pretty sketcher—the man who knows next to nothing of construction. "If," said Mr. Edis, "you build a prettypalace in which the chimnies smoke and the pipes burst, then

the designer is wanting in the first elements of architecture, for he does not know how to build." For a prominent man in his profession Robert Edis is, perhaps, the most conscientious in his work, for he labours with his own hand upon every commission. All plans are made by himself; the elevations and sections are worked up with pencil, and all important details go upon his board. Needless to say, the Colonel of the "Artists" is a stickler for duty. Every morning a sergeant comes over to his house with letters and for instructions of the day, and twice a week the Colonel spends some hours in the orderly room at headquarters. There he can draw his martial cloak around him and think of the days he served as aide-de-camp to Lord Bury during the Franco-German war, and of the days of the Commune, when he remained in Paris and witnessed all the terror of those times.

To the members of the Institute Robert Edis has read many papers, more particularly dealing with the decoration and furnishing of town houses. He has published a few books upon the same subject, has had the courage to become a London County Councillor, and the pluck to withdraw. Many persons hope to see his six feet two of manly presence on the benches of the House of Commons, but there are others, yourself among the number, who can see better work for so able an artist, outside the hot-beds of political intrigue. When the demands of a big practice allow him a moment's rest, Robert Edis can find what he wants at his delightful little Georgian home in Norfolk, where peace is the keynote of existence, and happiness and contentment the reward of a busy and conscientious life.

The Grimsby School Board on Wednesday night decided to build additions to existing schools giving accommodation to 1,130 children in the Weelsby district. At the same meeting the tender of Messrs. Illingworth, Ingham & Company, of Leeds, for the furniture and fittings for the Wintringham Higher Grade School, at a cost of £1,132, was accepted. The estimate was £1,049.

AN INTERIOR SKETCH, 1863, BY MR. R. W. EDIS.

ARCHITECTURAL ASSOCIATION.

MR. J. W. SINGER
ON
"IRON AND BRASS."

*We were furnished with advance proofs of Mr. Singer's paper, which we consider of so much interest that we shall print abstracts from it in our current and forthcoming numbers.

A MEETING of the Architectural Association was held at 9, Conduit Street, on Friday, Mr. E. W. Mountford in the chair. There was not a very large attendance of members. The minutes of the last meeting having been read and confirmed, a vote of thanks was passed to Mr. James Brooks for conducting the A.A. members over All Hallows Church, North St. Pancras, on the 2nd March. Similar votes were also passed to Mr. Shaw and Mr. George Sherrin for conducting members over the Brompton Oratory, on the 9th March. The following books had been presented to the library:—"Transactions of the Exeter Diocesan Architectural and Archaeological Society," vol. I. (new series), presented by Mr. C. J. Tait; and "Academy Architecture, 1892-94," presented by Mr. A. Koch; and a vote of thanks was passed to the donors.

Mr. J. W. Singer then delivered an exhaustive and interesting address on the subject of "Iron and Brass." He said:—"The two metals, iron and brass, are widely different in their qualities and characteristics. The former has been known from almost the early dawn of civilization, while our knowledge of the latter dates from comparatively recent times. Iron is one of the strongest metals, brass one of the weakest. Iron is nearly everywhere in nature, aërolites being almost pure iron; even the stars showing it through the spectroscope; and it forms about one-twelfth of the crust of our earth. Its particles are mingled in the dust of our roads, in the air we breathe, the water we drink, the food we eat, and is the great colourist of nature, giving the red colour to our blood. It is difficult to define when iron was first used in England, it having been questioned whether the Ancient Britons made use of it, but they worked in gold and silver, and Cæsar states that they had iron bracelets. Yet it is unknown whether the scythes which they attached to their chariot-wheels were of bronze or iron. For many centuries before Christ, and for fourteen centuries after, little progress was made in producing iron from the ore, the Hindoo, three thousand years ago, making iron and steel which cannot even now be surpassed, as they took the finest ore, free from phosphorus and silicates, and melted them with the best fuel, continuing this from four to eighteen hours, the soft composite mass being then rapidly separated from the cinder by hammering and reheating. A mild steel was produced by melting this bloom with charcoal, and thus was made the Wootz steel which Porus offered to Alexander as a precious tribute, and exactly the same process is carried out there to-day. We in our land of plenty, as regards iron, have but little idea how this metal was valued by our ancestors, and even in the sixteenth century iron had a price that it is now difficult to realise, and which I am able to illustrate from the records of the parish church of my native town. In 1574, the effect of the Reformation brought about a great change as to the furniture of the church, a more simple rubric being demanded, and for that reason many things, such as copes, crosses, and candlesticks, were sold. The churchwardens entered in their book of accounts of our church the results of that sale, and there appears, amongst other items, the disposal of sundry bars of iron. We see that they received for thirty-seven pounds of iron 3s. 1d. Money was then at least twenty times its present value, and at this estimate iron was then worth quite £180 per ton, or 1s. 8d.

a pound, instead of its present price of about one penny. I presume that everyone knows the first process of now making iron, it being simply to put the ore in a lofty furnace, with coal and limestone, so as to slowly melt the ore; the great effort being to see how little coal can be used for each pound of iron produced. Thus, in all rude attempts by a savage race, and even by the Romans to produce iron, they used eight pounds of charcoal for every pound of iron gained, which was a costly method. The next invention was the Catalan forge, which produced one pound for every $3\frac{1}{2}$ pounds of charcoal. To this succeeded the Jersey or Champlain forge, when $2\frac{1}{2}$ pounds of charcoal produced a pound of iron, this method being even now used in America and Spain, where wood can be easily procured. By all these processes the metal was not fully melted, but came out in a pasty form, which was at once hammered, and became good wrought-iron. The result of cast-iron was brought about by increasing the height of the furnace to gain heating power, it being then found that the iron was melted, becoming highly carbonised, and pig-iron was produced, which was of little use until the way was found of decarbonising the pig, which was done by the puddling furnace. The first application of iron for every purpose, whether for use or decoration, was undoubtedly in the form of wrought iron, such as produced by hammering, great perfection having been gained both by savage tribes for their weapons of war, and by the smiths of the eleventh and twelfth centuries, as may be seen in the well-known hinges on the doors of Notre Dame Cathedral. So excellent is this work that it has been seldom equalled, considered either in its massiveness in some parts, as compared to its delicacy of treatment in others. South Staffordshire has always been the field where first-class iron has been long produced, but it has yet to yield the palm to South Yorkshire for iron of the very highest excellence, especially to the Lowmoor Company, who possess a vein of highly carbonaceous coal combined with rich ironstone, which enables them to produce iron of the finest quality, but the price has always placed it beyond general use, it being three times dearer than several other brands. Although Dud Dudley, in the reign of James I., discovered the process of melting iron by means of coal made into coke by means of which there is no smoke, and thus surpassing his rivals both in quantity and quality, yet the secret died with him, and as late as 1740 the output of iron in Great Britain was only 17,420 tons. Up to the early part of the last century all iron bars were produced by the slow process of hammering, at that time the slit rode trade being entirely in the hands of the Swedish and Russian makers, when a young man, named Foley, who was convinced of the fitness of the iron of his district, determined to find out the process abroad, and being a good musician, he dressed himself up as a peasant of the country, and, taking his violin, travelled the country as a wandering minstrel, getting access to many of the foreign works, and then returned, rejoicing that he had found the secret of slit rod-making, at once commenced working near Kniver; but repeated efforts only resulted in failure. Still, not discouraged, he started again on his old tour to find out where he was wrong, and discovered that all was right excepting that he had omitted to put water on his rollers when working them. He again returned and successfully started the great horse-shoe nail trade, which has employed thousands of people, until their work was replaced by machinery. The Sussex foundries were so famous in the seventeenth century because, like the Swedish makers, they only used wood as fuel, and as the wood became scarce, that was the cause of these foundries vanishing from the land. It

was from a foundry of that county that came the rails formerly round St. Paul's Cathedral, and some of them still remain round the statue of Queen Anne. This railing was cast in 1714, at Lamberhurst, and was removed in 1874. I may mention that a part of this same railing is now lying in a stable-yard of a gentleman's house near Frome. As the modern system of very high furnaces only turns out cast-iron, called "pigs," and is very brittle, hence arose the puddling furnace to convert it into wrought-iron, by which action fire and air act as solvents to remove the sulphur, carbon, and phosphorus—which may be in the cast-iron according to the fuel used—the sulphur coming from the coal, the phosphorus from the ore, and the carbon from both. The primary stage of puddling is to melt the charge of white or mottled pig-iron, the molten metal being well stirred or "rabbed" to make it uniform, and to incorporate the "fettle"—fettle being the throwing-in of ground oxide of iron, which has been worked to the consistence of common mortar. The temperature is then raised until carbonic oxide is released, causing violent bubbles with a blue flame, the rabbling process being done with a long iron instrument protected with refractory cement, until the blue flame ceases. Bright grains of iron appear, the size of shot, which is termed "coming to nature"—i.e., the nature of wrought-iron. Then the puddler reduces the heat and begins to ball the iron into lumps of from 60 to 70 lbs., which are then ready for the hammer or the rolls. This process gives the iron a kind of fibre, making it less likely to snap. Another treatment of cast-iron is to make what is known as malleable iron, first used at the beginning of the century, and is essentially cast-iron made flexible by the process it goes through of annealing. The best Cumberland ore is required, and when the castings are first made they are hard and brittle. These are placed in pots, surrounded by ore of the same kind as the castings were made from, and are then subjected to heat for about a week, a conversion then taking place, like the formation of steel, the pot taking about three days to get to a white heat, which is kept up for twenty-four hours, and then for another twenty-four hours is allowed to die out, the castings being then ready for use. My paper being upon iron, it is not necessary to treat of steel, but it may be mentioned that iron and steel differ chiefly in the carbon which is mingled with the pure iron molecules—wrought iron containing little carbon, steel some, cast-iron more. This is most of the story, but, of course, not all. Thus, steel can be produced by taking carbon from cast-iron, or by adding carbon to wrought-iron. Wrought-iron is almost the only metal that can be welded together, which means that when brought to nearly a melting point, which is known by the sparks coming from the fire, and after some silver sand has been thrown in the fire to prevent oxidization from the air coming to it, by great quickness of action the two parts are brought together, and by smart hammering they become united in one solid piece. It is this quality which gives to wrought-iron its great charm as a metal for ornamental work, a charm that is all its own, and enables the smith to produce work which can be carried out in no other metal. No metal so repays a skillful workman as wrought iron, and in no other material is, I think, the distinction so evident as the stamp left upon it of good or bad treatment."

At the conclusion of the lecture the Chairman invited a discussion on the lecture.

Mr. Garbutt proposed a vote of thanks to Mr. Singer, and said the subject he had treated was a gigantic one. What puzzled him (the speaker) was how the Orientals managed to produce such huge bronzes and big cannon, some of which threw shot

of about 18 inches diameter. He heartily agreed with Mr. Singer in saying that it was a pity bronze was not more frequently used in place of brass. The possibilities of bronze were practically unlimited. In that metal there was such a fine variety of colour. It kept its colour so much better than brass, and the cost was not very much greater. He referred to a process which the Japanese had of making an artificial surface on brass in any colour, which had a wonderfully lasting character and required no lacquering. It could be applied to a great many of the smaller objects, such as hinges, door fittings, &c., and a great many decorative purposes. He asked Mr. Singer if he could explain how it was done.

Mr. Singer replied that he was afraid the secret was not known in England.

Mr. J. C. Stockdale seconded the vote of thanks, and said a paper of this kind was of some assistance to them in designing buildings, because if they bore in mind that a metal like brass had to be lacquered to keep its colour, it would perhaps deter them from using it in ways. He remembered seeing in a house some stock locks of lacquered brass. They were of very handsome but rough design, full of excrescences, so that the servants could not polish them, and every time they wanted cleaning they had to be taken off and sent to be re-lacquered. If they were to use bronze instead of brass, the question was, could they use it for repoussé work, or was it too brittle? With regard to wrought-iron, there were certain things that had to be borne in mind in using it. It was so easy to get an effect on paper, but it was so different when it came to be carried out. They had to be very careful how they introduced square and circular sections.

Mr. Satchell supported the vote of thanks. He thought in the use of bronze in tablets in buildings much might be done, especially if it were possible to obtain a lettering in the brass tablet which could be seen. There seemed to be a difficulty in obtaining any lettering which could stand, unless one went in for the very costly process of gilding. Then, as to the lacquering of brass. Certainly, for domestic articles, though there were artistic objections to it, yet what was the practical objection to it if they wanted an article for daily use? He thought a good lacquer was very much needed for the brass work of fire-places, and asked if there was any way of specifying it or ensuring that it should stand. With regard to wrought-iron he asked why the old wrought-iron, such as was used in grilles in convents, &c., should seem to stand so much better than the modern metal, a great deal of which, after it had been fixed for a few months, looked very shabby and rusty indeed.

The Chairman said one thing that puzzled him was where Moses got the brass to make the brazen serpent with; it must have been rather scarce about there. (Laughter.) Mr. Singer had made reference to the Sussex foundries which brought to mind the fact that there appeared to be some chance of their being restarted if the coal that they were digging for turned out to be any use. He did not know that it was altogether to be desired, because at present Sussex was a very beautiful country, and the possibility of it being turned into another Sheffield was too dreadful to think about. With regard to Mr. Singer's reference to screens, he must say that he never saw anything in a church satisfactory in the form of a screen of iron. Wrought-iron was all very well for grilles and such like, and though Sir Gilbert Scott and Mr. Pearson had put up some very fine ones, he could not say he admired them. The work seemed to be too light and too fine, and, in one instance which he had in his mind, it seemed to him they might as well have done without the screen and saved the money.

Mr. Singer, in reply, said first of all that

he was afraid he was not competent to say where Moses obtained the metal with which to make the brazen serpent. With regard to what the chairman had said about screens, of course it was not his (Mr. Singer's) place to speak upon that subject. It was entirely within the scope of the architect, but the fact of being able to make a screen so light, was, he thought, the very beauty of a screen. It was as strong as a wooden one and only one-tenth the substance. It did not obstruct the light, and the architecture was not interfered with in any way; while a wood screen shut out everything. With regard to the questions about lacquer, that of course was only a thin transparent varnish put upon a metal, and as long as it remained on the metal kept its colour. Lacquer came off very quickly in a damp place, and the metal then became dark, tarnished and streaky. It was really impossible to make bronze keep its colour out of doors, or to case the metal with any substance that would prevent it oxidising in the open air. All the principal statues in London might just as well be iron for they were perfectly black. In Bristol there was a bronze statue over 100 years old which had a beautiful colour. For repoussé work bronze was as good as brass, but copper was better than either. It was a softer metal and stretches more easily, and for that work was the best metal that could be used, except gold. In reply to the question as to the shabby appearance of modern wrought-iron work, Mr. Singer pointed out that there was a great difference in the price and quality of iron, and that iron at £20 a ton would stand better than iron at £7 10s. a ton. The meeting then closed.

Mr. Singer exhibited several specimens of iron and brass work, notably some heads of ancient Italian processional crosses, and some beautiful modern wrought-iron and brass, electroleirs, &c. There were also shown some exceptionally fine rubbings of ancient monumental brasses.

AN ART OF WHICH ENGLISHMEN SHOULD BE PROUD.

MR. JOSEPH PENNELL ON WOOD ENGRAVING.

THE art of wood engraving is an English art, says Mr. Joseph Pennell in a morning contemporary. But the fact that it is an English art is nothing to me. I should not care a jot or a tittle if it were French, German, or American, so long as it was great, so long as it was living or vital. But as it is English, Englishmen should be proud of it, for it has set the fashion to the world. Or rather, it has set not the fashion, but a standard of great art which the whole world has been only too glad to follow. It was but a few years after Bewick, a great artist who happened to engrave his designs on the wood block instead of drawing them on paper or engraving them in metal, had issued his masterpieces, that they became known first in France, where artists were more than ready to draw upon the wood and allow other artists to engrave the designs they had so drawn, and thus escape from the tyranny of the formless and unsympathetic engraver upon steel. It is to another Englishman, Charles Thompson, that French wood engraving owes its origin. When he went to Paris, in 1817, he found an army of artists and a phalanx of publishers willing to aid him with their art and their pocket-books in order to produce that series of books published in the French capital, which one day will be ranked with the wood-cuts of Dürer and the etchings of Rembrandt. From France, the English art of wood engraving spread to Germany, where its possibilities were at once appreciated by Adolf Menzel; even earlier it had penetrated to the United States, where it was taken up by Dr. Anderson, to whom, as Mr. Linton says,

belongs the honour of being the first engraver on wood in America. It was not twenty years ago, as usually asserted, that the American school of wood engraving arose, but one hundred and one. From that time until the present, the English art of wood engraving has flourished and advanced. It may be well, therefore, for me to say just what wood engraving is. It is the art—the English art, be it always remembered—of cutting with a graver (exactly the same tool used by metal engravers for centuries) a design upon a cross section of boxwood, so that this piece of boxwood, or a mechanical reproduction of it, known as an electrotype or a stereotype, may be placed with ordinary letterpress upon a printing machine and duplicated by hundreds of thousands of copies. And this fact that a wood engraving can appear along with type is what has given it its importance and its position amongst the graphic arts. Before the time of Bewick, and even for some thirty or forty years after, that is, until about 1840, steel engraving and mezzotint were the methods usually employed for reproducing pictures, or drawings, wood-cutting, as perfected by Dürer some three hundred years before—the art of cutting a design drawn on the flat side of a plank, with a knife or chisel—having virtually disappeared. A steel engraving, an etching, or a mezzotint cannot be printed with type; but a wood engraving can, and a skilful engraver can imitate, if he wishes, the better part of the qualities of the first two methods. Therefore wood-engraving became popular, and this partly owing to the fact that it was much cheaper. It was also more true, for the artist drew his design upon the box-wood, and the engraver cut it in into the wood, and the printer printed it. To it we owe those gems of art, Northcote's "Fables," produced in 1828; Harvey's "Arabian Nights," in 1838; France; and Anderson's copies of Bewick, brought out in America in the early part of the century. I might easily pass in review the wonderful engravings printed in Currier's "Paul et Virginie," in the same year in early numbers of the *Illustrated News*, which I have before me, the volume for 1850 being artistically far finer than anything produced under the present management. I might refer to the manner in which Sir John Gilbert, Birket Foster, Samuel Palmer, and Harrison Weir, among others, when they were engraved by Vizitelly, Andrews, the Orrinsmiths, continued the traditions of Bewick. I might speak of the designs by Rossetti, by Burne-Jones, by Sandys, by Whistler, by Millais, Walker and Boyd Houghton, by Ford Madox-Brown, reproduced by Linton, by Swain, by Dalziel in Moxon's "Tennyson," and the *Cornhill* and *Once a Week*. It is true that at present the trade of wood-engraving is threatened by the cheapness of process-engraving, a state of affairs for which, to some extent, the wood-engravers are responsible. A few years ago they became so independent, like their predecessors, the wood-cutters of the fifteenth century, that they forgot the existence of the artist, and in consequence the artist rebelled against them. As a result the publishers, seeing that the artist did not like bad wood-engraving—the public knew nothing about the matter—and the good process costing them about a tenth as much, encouraged process. I shall not attempt to describe process, save by saying that it is a mechanical method of reproducing drawings which are made in line or in wash, and also that a mechanical reproduction of a line drawing is quite equal, and often superior, to the wood-engraving, and that the mechanical reproduction of wash-drawings is either greatly inferior or vastly superior to the wood block, according as the wood-engraver is an artist or a duffer. But, inferior or superior, it is vastly cheaper. And this cheapness, which means, of course, so much

saved by the employment of process, has played havoc with the average wood-engraver. An ordinary process block costs about one-tenth as much as the ordinary wood block, and it takes about one-tenth as long to produce. Therefore the ordinary publisher uses it, and the ordinary buyer of books accepts it. One is simply amazed at the unemployed talent in the art of wood-engraving which exists in England to-day. The reason that these artists' services are not in demand is simply because of the niggardly sweating system which has crept into the English trade of publishing.

PROFESSIONAL RULES.

THE Boston Society of Architects has prepared, says *The Building News* in its current issue, a "code of ethics" for its members, which has been adopted by the Society. It comprises sixteen sections, embodying principles that have been generally accepted, though not invariably observed, by the profession. Many of the rules will be usefully considered by architects on this side of the Atlantic. We have no space here to give the rules *in extenso*, but may allude to two or three of the more important. Section 1 precludes a member from entering into partnership with any builder or contractor; section 2 provides that a member owning any building material or invention proposed to be used on the work for which he is architect should inform his employer of the fact. Section 5 observes it is unprofessional to offer drawings on approval and without adequate compensation; section 6, that it is unprofessional to advertise in any other way than by notice giving name, address, profession, and office hours, and special branch of practice; section 7, that it is unprofessional to make alterations to a building designed by another architect within ten years of its completion, without notice to the said designer. Section 9 declares it to be unprofessional for a member to criticise in the public prints the professional conduct or work of another architect except over his own name or under the authority of a professional journal. The other sections refer to the unprofessional attempts to supplant an architect after steps have been taken towards his appointment; to furnish designs in public or private work unless for proper compensation; the observance of a schedule of charges as a minimum rate, and by charging higher rates whenever necessary; to take work at a lower rate than another, &c. The rules contain nothing but what every respectable architect will readily accept, though some of them are shamefully transgressed in practice, simply because there is no written law binding on the profession. Thus how often architects are willing to furnish designs for work without remuneration, and to undertake to do work at a lower rate than a brother professional—practices very derogatory to a professional man, and acknowledged in theory to be wrong. When these irregularities are made the subject of explicit rules, few will be disposed to disobey them.

OWING to the overheating of a slow combustion stove, an outbreak of fire occurred early yesterday morning in the Garrison Library of the Cambridge Barracks, Portsmouth. The barracks are occupied by a detachment of the the Royal Artillery. The fire was got under within an hour, and was confined to the library.

WE understand that Mr. Grainger Heiton is completing plans for the restoration of St. John's Church, Perth, showing alternately the throwing of the east and middle churches into one, and the improvement of the middle church on the footing of the churches remaining separate.

ARCHITECTURAL IRONWORK: CONSTRUCTIVE AND DECORATIVE.

A Series of Instructive Papers for the
Artist and Worker.

CHAPTER IV.

STANCHIONS (continued).

CONTINUING the remarks upon stanchions and such like members, which are now cast in much larger sizes than was formerly the case, it may be here mentioned that, if the distance to be covered is too great for one casting, joints are sometimes permitted, though these are not often rendered necessary. In such cases the joints may be made about half-way up, or equidistant. In this eventuality the ends of both portions of the stanchion must be carefully planed or turned up true, and the flanges which terminate them securely bolted together, as shown at Figure 8 (*ante*). With regard to the load-bearing ability of stanchions opinions differ among those authorities to whom we look for information in the matter. Thus Mr. Henry Adams says, with respect to the relative strength of columns and stanchions, that "a stanchion of + section is much less economical than a hollow cylindrical column as far as the use of metal goes. For instance, a cylindrical column of the same external diameter as the stanchion, and containing the same sectional area, will have nearly double the strength. There are, however, advantages in certain cases in employing stanchions." Mr. Adams gives the following tabular statement of the approximate safe load on columns and stanchions, and for supplements to and comparison with those previously given will prove useful:—

"Up to 10 diameters long = 5 tons per square in.	
From 10 to 15 "	= 4 "
" 15 to 20 "	= 3 "
" 20 to 25 "	= 2 "
" 25 to 30 "	= 1½ "

"For permanent structures," says the same authority, "when these figures are used some allowance for contingencies should be made."

As we have previously mentioned, the *formule* of the various authorities as regards the factor of safety differs very considerably, and this being so, we give below some of the highest and most representative, which should be made a note of by those more particularly concerned in this department of structural ironwork:—

Strength by Gordon's Formula.

W = crushing weight in tons.
s = sectional area in square inches.
d = diameter over arms in inches.
l = length in inches.

$$W = \frac{36 s}{3 l^2}$$

$$I + \frac{400 d^2}{400 d^2}$$

$$W \frac{36 \times 15}{3 \times 120^2} = 201 \text{ tons crushing weight}$$

$$\text{Safe load} = 201 \div 6 = 33.5 \text{ tons.}$$

By Timmin's Formula.

8" x 8" x 1" = 15 square inches area = 46.8 lbs. per foot run, and for 10 feet length, safe load = 20.1 tons.

By Box's Tables.

Breaking weight in tons:—

8" x 8" x 1" x 10 feet long = 261 tons.

$$\frac{261}{6} = \text{safe load of, say, } 43\frac{1}{2} \text{ tons.}$$

By "Lockwood's Engineers' Pocket Book."

Safe load in cwts.:—

8" x 8" x 1" x 10 feet long = 354 cwts.

$$\text{or } \frac{354}{20} = 17.7 \text{ tons.}$$

By Box's Formula.

$$Mp \times L \text{ 1.7 ft. } (6^{2.6} \times t) \div 2.6 \times b - t \text{ inches} = \text{B.W. tons by flexure}$$

which must not exceed one-quarter of the sectional area x ultimate crushing strength (cast iron equal to 42 tons) per square in order to provide against incipient crushing.

$$8^{2.6} = 223, 1^{2.6} = 1, 10^{1.7} = 50.1.$$

Mp. = constant multiplier for cast iron =

75 both ends flat

50 one end flat

25 both ends pointed.

$$75 \times \frac{(223 \times 1) + (1 \times 7)}{50.1} = 344 \text{ tons B W}$$

$$\text{but } \frac{15 \text{ square inches} \times 42 \text{ tons}}{4} = 157.5 \text{ tons}$$

which is the maximum efficient strength and safe load =

$$\frac{157.5}{6} = 26.25 \text{ tons.}$$

Herewith is a comparison of the preceding rules:—

Gordon's formula		33.5 tons.
Timmins' tables		20.1 "
Box's tables		43.5 "
Lockwood's tables		17.7 "
Box's formula		26.25 "

It will thus be seen that the subject of stress, safe-loading and breaking is enveloped in very considerable doubt, and requires to be still subjected to further careful experimenting. We could supplement the foregoing with other tables, but those given will suffice as representative rules arrived at by authorities which can be trusted. And here we may note that Hodgkinson stated, as the results of experiments conducted by him, that a cast-iron pillar of + section, 3" x 3" x 48" and 7.562 feet long, both ends being pointed, broke with a pressure of 17,578 lbs., equal to 7.8475 tons.

The following useful table is extracted from that very reliable and useful handbook, "Lockwood's Builders' Price Book." This table shows the dimensions of cast-iron stanchions, 10 feet in height or length, and adapted to sustain loads of 1½ cwt., 2 cwt. and 4 cwt. per superficial foot:—

Dimensions of Stanchions.		Load in cwts.	Extent of Flooring.		
Thickness of ribs or flanges.	Diameter of circle which will circumscribe the sectional area.		Allowing 1½ cwt. per superficial foot.	Allowing 2 cwt. per superficial foot.	Allowing 3 cwt. per superficial foot.
Inches.	Inches.		super. feet.	super. feet.	super. feet.
1	4	40	268	20	133
1	5	77	513	384	253
1	6	128	853	64	423
1	7	191	1273	953	633
1	8	266	1773	133	883
1	8	354	236	177	118
1	9	452	3013	226	1503
1	10	550	3663	275	1833
1	12	959	6393	4793	3193
1	13	1,259	8393	6203	4193

With this table we think our remarks upon stanchions may terminate, as our readers should make further inquiries for themselves.

THE work in connection with the re-arrangement and improvement to the great Renaissance Church of St. Phillips, Salford, is about to be commenced, and will include, as funds permit, interior decorations in mosaic, fresco or painting. The plans were prepared last year by Mr. J. Medland Taylor.

THE Glossop Town Council, being anxious to purchase the Town Hall and Markets from Lord Howard, the Committee were recently empowered to make an offer of £9,500. Lord Howard, however, refused this offer, but said he was willing to accept £10,500. It has, therefore, been decided to abandon the project.

THE cost of the Marseilles and Rhone Canal is estimated at 80,000,000f., half of which is to be provided by the State and half by the city and the department. It will be 33 miles in length, including a tunnel four miles long.

A CASE UNDER THE NEW BUILDING ACT.

SIR JOHN BRIDGE'S CRITICISM.

MR. FREDERICK WALLEN, District Surveyor for the parish of St. Pancras West, appeared before Sir John Bridge last week to two summonses calling upon him to show cause why a decision he had arrived at with regard to the proposals of Messrs. Shoolbred to erect new buildings on a site they possess at the corner of Tottenham Court Road and Grafton Street, adjoining their other premises, should not be reversed. —Mr. J. P. Grain and Lord Robert Cecil appeared for Messrs. Shoolbred.—The case was one of the first under the new London Building Act, which came into operation at the beginning of the present year. Mr. Wallen, the District Surveyor, had reported that the plans for the new buildings submitted by Messrs. Shoolbred were in some respects in contravention of the new Act, and at the last hearing Mr. Grain argued at length that they complied with the Act in every essential particular.—Mr. Grain now resumed his argument, and mentioned that when the plans were first sent in Messrs. Shoolbred contemplated having something like a hundred sleeping apartments for their employes, but on the suggestion of Mr. Wallen that part of the plan was altered. No doubt Mr. Wallen was doing what he conceived to be his duty, but he (counsel) respectfully suggested that in this instance he was labouring under a mistake in alleging, as he had done, that the proposed buildings were of the warehouse class. The buildings would be of a magnificent character, and every precaution had been taken to guard against fire. The proposed buildings were, he contended, of a domestic class, and would therefore be treated differently to warehouse buildings.—Mr. Wallen said he was willing to waive and withdraw his notice as to the buildings being of the warehouse class. He would admit that they were, under the Act, domestic buildings, but he contended that, under Section 41 of the Act, sufficient air space was not provided.—Sir John Bridge asked Mr. Wallen if he understood the Section.—There was no reply until Lord Robert Cecil said that no one understood it when it was passed.—Sir John Bridge read a section, and said it was perfectly unintelligible. —Mr. Wallen: That refers to the plane of the line, Sir John.—Sir John Bridge: I am glad there is something plain about it. (Laughter.)—Mr. Wallen remarked that if Mr. Grain's contention were correct all the backyards in London might be covered with houses.—Sir John Bridge, in giving his decision, said he was glad he was not bound to determine this case on the construction of any of the sections of the Act that had been quoted, because almost all the sections of the Act seemed to him to be so drawn as to be perfectly unintelligible. Where intelligible, many were intelligible in two different ways, and capable of two different constructions. There was one point which was a matter of fact. He found as a matter of fact that the buildings were to be used principally as offices or counting-houses, and made an order setting aside the objections of Mr. Wallen as to Section 41, the other objections being withdrawn.—Mr. Grain mentioned that Mr. Wallen objected to being described as a person summoned to appear before the Court.—Mr. Wallen suggested that a notice instead of a summons would be quite sufficient, and it was understood that in future cases the word "notice" would be used.

THE Governors of the Llanelly Intermediate and Technical Schools have decided to advertise for plans and designs for schools to be erected at a cost of £5,000.

THE PROJECTED ALTERATIONS OF MANCHESTER CATHEDRAL.

THE glowing descriptions of the intended pile which, we are told, says a correspondent to a Manchester contemporary, is soon to arise between the present western end of the Cathedral and Victoria Street, whether those who provide the funds—i.e., the ratepayers—like it or not, seem to come from the pen of one who has not studied the site and neighbourhood of the Cathedral in any but a slight and superficial manner. It is suggested that we should have "a practising school for the choir," "a consistory court," and "a worthy ceremonial entrance." I agree that the present arrangements outside the west end leave much to be desired; but to lop off a large slice from the churchyard does not mend matters. What Mr. Basil Champneys proposes to do at the west

tising school for the choir of sufficient size to serve as a meeting place for the Easter vestry or other parochial or ecclesiastical gatherings; also a separate vestry for the clergy, a consistory court, and a dwelling house for one or more of the cathedral attendants. There might be also a crypt, if not for interment, yet to receive monuments of distinguished citizens. What I propose would go a long way towards giving to the old church a cathedral-like appearance. It would cost little more than the mere spend-money proposal, which, however well carried out in detail, has its foundation in a serious error of judgment.

MR. HUTTON, architect, of Kendal, is preparing plans for the new tramp ward which the Guardians of Sedbergh propose to erect at the workhouse.

Edward Bateman, Birmingham; Alfred Whitelock Field, Croydon; George Gunn, Ayr; Wilberforce Ernest Hazell, London; John Henry Price, Liverpool; Harry Tom Boden Spencer, London; George Augustus Bligh Livesay, Boscombe, Bournemouth; Alexander Paul Macalister, Cambridge; Thomas Harry Weston, Bristol; Henry James Wise, Gospel Oak, N.W.; Herbert Jeffrey Palmer, New Malden; Joseph Spain, Sunderland; Charles Septimus Errington, Newcastle-on-Tyne; Frederick Brice Hobbs, Waterloo, near Liverpool; Harry Wilson Pye, London; John Cadwallader Dewhurst, Belfast; William Edgar Gauld, Aberdeen; Robert William Horn, Glasgow; Vivian Herbert King, London; Alfred Henry Mills, Manchester; Thomas Aloysius Pole, London; George Patrick Sheridan, London; Percy Henry Adams, London; Harold Bailey, Hull; Percy Paovich Cotton, London; William

ENTRANCE GATES, EATON HALL.—MR. R. W. EDIS, ARCHITECT.

THE R.I.B.A.

A SPECIAL meeting of the Institute was held on Monday, the 11th inst., with the President in the chair, to move: "That, subject to Her Majesty's gracious sanction, the Royal Gold Medal for the promotion of architecture be presented this year to Mr. James Brooks, Vice-President, for his executed works as an architect." Mr. Charles Barry seconded the motion, which was unanimously carried. The following were subsequently elected members of the Royal Institute. *Fellows*:—Waterhouse, Paul, London; Henman, William, Birmingham. *Associates*:—Thomas Kershaw, Halifax; William Hodgen, London; Ernest Edward Fetch, London; Frederick Bligh Bond, Bristol; John Pain Clerk, London; William Edward Vernon Crompton, Wallgate, Wigan; Frederick Ernest Pearce Edwards, Liverpool; Henry Ernest Kirby, London; Charles

Adam Forsyth, London; Francis John Potter, London; Charles Henry Smith, London; John Borrowman, jun., London; Harry Ebenezer Budden, London; Frank Berridge Cooper, Leicester; Archibald Campbell Dickie, London; Samuel Stevens Dottridge, London; Arnold Seaward Tayler, London; Harold Edmund Church, London; Henry Ingle Potter, London; Alexander Robert Hennell, Forest Hill, S.E.; Allen John Pinn, Exeter; Sydney Benjamin Beale, London; Henry Ascough Chapman, Scarborough; George Coster, Bournemouth; Ernest Outram Cummins, London; Herbert Alfred Legg, London; George Oakley Scorer, London; Thomas Duncan Rhind, London; Luke Barlow, Manchester; John Laurie Carnell, Norwich; Hyla Edward Elkins, London.

SANCTION has been obtained by the Brentford Guardians to borrow £37,800 for an infirmary.

end would, however well done, add nothing to the cathedral-like character of the building. Whatever may be done should as far as possible help to change the old parish church into a real cathedral—the cathedral of one of the greatest and most important dioceses in the kingdom. It is clear that we cannot have the central tower of a cathedral, nor, very well, the twin flanking towers as at Exeter; but we might have, and I maintain that we ought to have, some of that picturesque grouping of the necessary or desirable buildings that go so far in giving to cathedrals at home and abroad their charm and fascination. The buildings that are wanted would take comparatively so little space and be of so modest a height that, if skilfully treated, they might extend into the churchyard on the south of the Cathedral without seeming in the least to crowd it. There should be a choristers' vestry and prac-

Trade and Commerce.

We shall be glad to receive copies of catalogues from firms engaged in the allied building trades. These will be carefully looked through, any novelty noted, and—should its nature seem to demand it—fuller attention drawn thereto. We are particularly wishful to secure the friendly interest of designers and artificers in *THE BUILDERS' JOURNAL*, and, now and then, we might see our way to reproduce an outline sketch or illustration of any contrivance that struck us as being new or needed. Building covers up—figuratively, and in fact—so much ground, and we mean to cover the whole of it.

We should be further obliged if firms would indicate, by some suitable mark, the pages in their catalogues to which they would, in particular, desire to call our attention.

Extension of Patent Office.—Mr. B. E. Nightingale, of the Albert Works, has secured the contract of the new No. 3 Block of the Patent Office. Messrs. Mark, Fawcett & Co., of Westminster, are to construct the fire-proof floors.

Aspinall's "Wapicti."—A new washable distemper paint that can be manufactured in any tint, and which has been designed for application to plaster, stucco, brick, stone, cement, &c. It is capable of yielding good artistic effects by stencilling, and therefore adapted for livening up interiors by decoration, having a flat surface suited for the purpose. Among the advantages claimed for "Wapicti" are that on exterior work it dries with a surface impermeable to the most drenching rain, and can be used with advantage for farm dwellings, wooden or other houses, and general work on estates, that the effect obtained with it is far superior to that of flatted paint, and costs one-third less. It is very largely used for painting the walls of asylums, churches, hospitals, railway stations, schools, private houses, &c.

The Eccup Reservoir.—The Leeds Waterworks Committee received recently a report from Mr. Hill, C.E., on the work of the reconstruction of the Eccup Reservoir, a heavy undertaking which has been long in progress. Mr. Hill had examined the bottom of the trench, and approved of the work done. He agreed with the city engineer (Mr. Thomas Hewson) that the repuddling of the deepened portion of the trench might now be safely commenced. Brick side screen walls, he thinks, should be built on the reservoir side of the trench to protect the puddle. The total depth of the trench from the finished road level to the bottom is 170 ft., the length along the bottom 420 ft., greatest width at the top 26 ft., and average depth of shale taken out below the bottom of the old trench 39 ft.

Mr. Potter's "Concrete."—Mr. Potter sends us his voluminous work on Concrete, published by Mr. Batsford, as a new edition of an older work. But it is the standard book upon a really very interesting subject, and one Mr. Potter has made peculiarly his own. It deals, as many of our readers will know, of concrete as a material; of matrices; the making and mixing of concrete; concrete for artificial foundations; and the shrinkage of materials used in the making of concrete. These are merely the heads of the various chapters. Every actual use to which the material can be put is discussed and explained, and there are many illustrations to assist the reader. Mr. Potter's own system of concrete floors is fully described.

Business Announcement.—Messrs. W. E. Constable & Co., of Monument Chambers, King William Street, London, E.C., inform us that they have converted their business into a limited liability company, and that the firm will from now be known under the style of W. E. Constable & Co., Limited. The present partners—Mr. Sydney Constable and Mr. J. F. Weymouth, jun.—become joint managing directors, and in all other respects the business will be carried on as before.

The County Council.—Last June the Council resolved to erect, without the intervention of a contractor, a new station in place of the existing fire-engine station at Fulham, the cost of the work being then estimated by the architect at £10,500, and on June 26th, the Works Committee reported that it was satisfied with the estimate and specification, and was taking the necessary steps to carry out the work. Owing to circumstances which has been fully explained in previous reports, it has not been practicable until now to commence the work, and, the price of materials having in the meantime increased, the Works Committee suggests that the estimate needs revision. The architect has been consulted, and he reports that if he were now making an estimate upon the drawings and specification sent to the Works Committee last year his figures would be increased by £500. He also asks that, as the building is to be erected a few feet back from the line originally proposed, a sum of £400 may be added to cover the cost of fencing in a strip of additional ground which has been acquired and which he suggests might be excavated with a view to the better lighting of the basement. The revised estimate of the cost of the station is therefore £11,400, and it is recommended that the revised estimate be referred to the Works Committee.

Shorland's Stoves.—The Cottage Hospital, Fleetwood, is being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

Discovery of Coal in Ireland.—A Manchester Syndicate, which has been sinking for coal near Dungannon, County Tyrone, has come upon an extensive seam, of splendid quality, 190 yards from the surface.

An Improved Sewer Pipe.—An interesting test of an improved sewer pipe joint lately took place on the premises of Messrs. Monsell, Mitchell and Co., Townsend Street, Dublin. This method has been devised by Mr. T. Fitzpatrick, who has disposed of his patent to Messrs. Craig & Co., Kilmarnock. The latter are now manufacturing pipes with the new joints, and have appointed Messrs. Monsell, Mitchell & Co. their sole agents in Dublin. The new joints, by an ingenious arrangement, ensure in the connected pipes that perfect uniformity of bore which is essential for proper drainage.

Spalding.—At the meeting of the Spalding Urban District Council a scheme was adopted for considerably extending and improving the public lighting of the town. It was also decided to erect another gasholder and carry out other improvements at the Spalding Gasworks, at an estimated cost of £3,000.

Morecambe, Lancashire.—Extensive building operations are being carried on at the present time at this popular seaside resort. A fine block of shops and boarding houses have just been completed at the West end, where there is also a large hotel in process of erection. At the east end, a central site in "The Crescent," a new bank for the Lancaster Banking Company is being built from designs by Mr. E. H. Dawson, A.R.I.B.A., of Lancaster. There is also a large market and assembly hall (to be called the Victoria Market and Hall) which is to be ready by the summer season. During the last few years Morecambe has grown very rapidly. On Wednesday afternoon the directors of the proposed West-end (Regent Road) Pier, (the architects for which are Messrs. Magnall & Littlewood, of Manchester), met and opened the tenders for the first section of the work, extending beyond the Pavilion, and this portion was let to the Widnes Foundry Company, of Widnes. The work will be commenced within the ensuing fortnight.

Oban Outfall Works.—The result has been published of the competition invited for the sewerage and sea outfall works at Oban. There were twenty-five designs sent in for selection. The Town Council appointed a professional assessor in Mr. T. Niven, C.E., Glasgow, and under his report the plans judged best in order of merit were—first, "Kerrera"; second, "Gravitation." The author of the first premiated design was found to be Mr. Woulfe Brennan, C.E., of Oban, and of the second Mr. Radford, C.E., of Nottingham.

New Clock and Chimes.—A large new clock and chimes, of Lord Grimthorpe's design, have been erected in the parish church of Halesowen, near Birmingham, and formally started by a former rector of Halesowen (Canon the Hon. F. G. Pelham). It is fitted up with all the latest improvements, and will doubtless be a boon to the inhabitants. The whole of the work has been carried out by John Smith & Son, Midland Clock Works, Derby.

SOCIETY MEETINGS.

Liverpool Architectural Society.—At the meeting of this society, held on Monday evening week, in the Law Library, Union Court, Mr. Henry Hartley presided. He referred to the death of Mr. Charles Aldrich, F.R.I.B.A., saying that he was one of the oldest, most active and most esteemed members of their society. Mr. T. Cook, in moving a vote of condolence with the family of Mr. Aldrich, said that his deceased friend was one who was highly thought of by the whole of the profession. Mr. Matear seconded the vote, which was carried. A paper, by Mr. Percy S. Worthington, of Manchester, entitled, "Churches of the Twelfth and Thirteenth Centuries in Burgundy," was afterwards read.

York Architectural Society.—There was a good attendance at the Church Institute, Lendal, when Mr. John Lane delivered an interesting and instructive lecture, which was entitled "The City of Brussels." Mr. A. Pollard, past president, presided. In his lecture Mr. Lane described the places of interest in Brussels, considered both from the visitors' and the architects' point of view, and particularly mentioned the cathedral and chief churches, and the celebrated Palace of Justice, and the boulevards. He also spoke of the laying out of the existing city, and the improvements that had taken place in the buildings during the present century. The lecturer gave a short account of the history of Belgium, and of the wonderful progress that had been made during the reigns of Leopold I. and Leopold II., the present king. The lecture also included a description of Belgian peasant life, and treated of several places of interest in Belgium.

Edinburgh Architectural Association.—At the meeting of the Edinburgh Architectural Association, Mr. W. W. Robertson presiding, after the transaction of some formal business, Mr. A. Hunter Crawford read a paper on "The Suburban House." We were leaving behind us, said the lecturer, the idea that the portico of a Greek temple might be adapted to the porch of a suburban house, and we even thought now that the perfect propriety and respectability of Newington might be improved upon. A well-designed house was homelike from the outside, convenient in its arrangements and interesting in its features. A good plan greatly depended on the size and arrangement of the hall and staircase, on the pantry and its relation to the dining-room, kitchen and entrance, and on the limited space wasted in passages. The lecturer illustrated by limelight views good and bad types of plans, and then proceeded to contrast stone and brick houses, advocating a freer use of brighter and warmer materials. Characteristic work by Messrs. R. Norman Shaw, R.A., George Sherrin, Ernest George and Peto, C. F. A. Voysey, Ernest Newton, E. J. May and other able architects was shown on the screen.

Glasgow Architectural Association.—The annual meeting was held in the rooms, 114, West Campbell Street, Mr. A. N. Paterson, in the chair. The seventeenth annual report, which was read by Mr. W. R. Watson, secretary, narrated the work of the Association during the past session. Memorials, it stated, had been addressed by the association to the Town Council relative to the proposed removal of the Tron steeple, and to her Majesty's Office of Works with reference to the repairs in progress at the cathedral. The most noteworthy event of the session had been the successful arrangement of a scheme of co-operation with the Glasgow Institute of Architects, for the acquirement of premises to be jointly occupied by the two societies.

SAWDUST.

THE extension of the City Hospital, Netherfield Road North, Everton, for which the Corporation has been authorised to borrow the sum of £26,000, was considered by the Hospitals Committee with a view to the modification and improvement of administrative arrangements in the enlarged institution. The site has been enlarged to the extent of two acres, and the work of rebuilding will be entered upon forthwith.

THE Halifax Town Council has unanimously resolved to purchase the present Infirmary Buildings and the ground upon which they stand, as a site for the proposed new Police Offices. The price agreed upon is £7,000, and this works out at 32s. 3d. per yard. The Council is in favour of the erection of Police Offices and a Court House, the cost not to exceed £8,000, making with the cost of the site £15,000 for the whole scheme.

FROM the 63 designs sent in for the proposed new Sanatorium at Crewe, the first premium has been awarded to Mr. George E. Bolshaw, of Lord Street, Southport, and the second to Mr. S. Harding Payne, of Bedford Row, London. Mr. Bolshaw is to be employed as the architect for the new building, provided that any alteration of his design required by the Health Committee be made without any extra cost. The cost of the Sanatorium will be about £5,000.

PLANS for the erection of a permanent hospital, at an estimated cost of £8,780, have been passed by the Keighley and Bingley Joint Hospital Board. The architect, Mr. F. Moore, has been instructed to push forward the work as quickly as possible.

A SPECIAL meeting of the Mold Urban Council was held on Wednesday last, for the purpose of meeting Mr. D. H. Radford, the engineer of the proposed sewerage works for the town and district. It was decided that the whole of the schemes as presented by Mr. Radford be adopted, and that the works be proceeded with at once. The estimated cost of the work is between £7,000 and £8,000.

THE Swansea and Aberavon section of the Rhondda and Swansea Bay Railway, giving a through passenger service from Freherbert to Swansea was opened on Thursday last. The line cost nearly a million to construct, and has taken fourteen years to complete.

THE scheme for supplying the high level districts of the Wakefield Rural Council's area with water, affecting portions of Stanley, Crigglestone, Ardsley, and Shitlington, has been referred to a committee for further investigation and report. The total expenditure on the proposed new reservoir at Ardsley and other necessary works is estimated at about £20,000.

THE studios are full of preparation for the approaching Art season. "Show Sunday" for outsiders is on the last day of the month; several members of the Royal Academy have already sent out their invitations for the following Sunday, April 7 (Palm Sunday), and, in many cases, for the previous day also.

ON Thursday, the 14th, a vestry meeting was held in Wakefield Cathedral to consider what action should be taken with reference to the offer recently made by Col. Clapham, of Manchester, to provide a new reredos, &c., for the Cathedral. Archdeacon Donne, the Vicar, presided, and it was resolved that Messrs. Stewart, Sons & Chalker should at once apply for a faculty to remove the present reredos from the Cathedral and to erect a new reredos and a rear table.

It has been decided to build a new parish Church at Wombwell, and a public meeting in connection with the scheme is to be held. The present structure is a very old building, and is in a bad state of repair.

A SUBSCRIPTION has been started in France for the purpose of restoring the ancient Palace of the Popes at Avignon. The historical building, which has greatly deteriorated, will be transformed into a museum of the King René period and of the transference of the Papacy to Avignon. A special barracks will be built for the garrison, whose quarters are now in the palace.

LOVERS of metal work, arms, and armour will be interested in the sale at Christie's, which commenced yesterday and continues for four days, of the celebrated collection of Mr. Edwin J. Brett. It will be the most important sale of examples of the armourer's art since the dispersal of the great Meyrick collection.

THE Leicester Town Council have unanimously adopted plans for a new technical and art school which is to be built on a site of their own at a cost of £35,000. At present the technical and art schools are in different parts of the town, and are full to overflowing. But by the new arrangement the entire technical and art teaching passes under the control of the Corporation, and under its own roof.

MR. FREDERICK WHEELER, F.R.I.B.A., of 22, Chancery Lane, W.C., and 4, Carfax, Horsham, is the architect for the board school to be erected at Horsham. Mr. Peter Peters, of Horsham, is the builder.

It is proposed to restrict the expenditure on the joint isolation hospital, Ware, to within £5,000, including fixtures and provision for small-pox cases.

THE Stamford Board of Guardians has decided to expend £5,000 in alterations and additions to the workhouse.

APPLICATION is to be made by the Town Council of Salford for powers to borrow £100,000 (including the sum of £13,268 already applied for) to provide for contemplated extensions of the gasworks.

THE convalescent home has just been commenced at Littlehampton. Messrs. Holland and Hannen, of High Street, Bloomsbury, W.C., are the builders, and Mr. Frederick Wheeler, F.R.I.B.A., of 22, Chancery Lane, London, W.C., and 4, Carfax, Horsham, is the architect. The whole building will be lighted by electricity, and fitted with every modern convenience. It is expected that the building will take a year to complete.

THE sum of £1,798 is to be expended by the Town Council on alterations and additions to the Portsmouth public baths.

THE adoption of the eight-hours' system at the Woolwich Arsenal continues to give the most satisfactory results. The amount of work done is quite equal to that accomplished under the old plan when the hours were longer. There are at present altogether about 16,000 men and boys employed in the Arsenal.

MRS. HESKETH, lady of the manor of North Meols, has promised £2,000 for a new church for the ancient parish of St. Cuthbert's, Churchtown, Southport, and another generous helper has promised £500. The new edifice will take the place of the old building, which is the mother church of Southport.

It is proposed by the Manchester City Council to construct underground conveniences in St. Peter's Square, and at the corner of Corporation Street and Hanging Ditch. Application for sanction to borrow £1,500 for the purchase of property and the laying it out as a pleasure ground is also to be made.

THE plans of Messrs. Jenkins & Marr, of Bridge Street, Aberdeen, have been adopted for the new fever hospital to be built at Inverurie.

THE French workmen employed in the construction of a fort at Pont St. Vincent, near Nancy, on Saturday night attacked the contractor of the works, pelting him with stones and uttering loud cries of "Death, Death!" The gendarmes succeeded in keeping back the mob, and escorted the contractor to the municipal offices, where he took refuge. Reinforcements were sent for and on their arrival order was restored. The outbreak was due to jealousy of the Italian workmen, a number of whom had been engaged for the works in question.

THE Baths Committee of the Derby Town Council has had before it the plans and estimates prepared by the surveyor for building new baths on the almshouse site in Full Street. The surveyor's estimate for the new buildings is £15,000, exclusive of furnishing. The committee recommend the Council to grant the sum of £15,000 for building the baths. It is also proposed by the Town Council to make alterations and additions to the electric light installation at a cost of £5,000.

THE £6,400 required for the erection of the casual wards, etc., at the Sunderland workhouse has been sanctioned, and it is proposed to proceed with the work at once.

PREMIUMS of £100 and £50 are offered by the Ipswich Board of Guardians for the two best plans submitted for the rebuilding of the workhouse.

FURNISH BY GRADUAL PAYMENTS

ON

NORMAN & STACEY'S

LIFE ASSURANCE SYSTEM.

This System enables customers to obtain, by small Monthly Payments, the immediate enjoyment of a well-appointed and artistic home of their own at less cost than renting furnished houses or apartments. By special arrangement with one of the best Life Assurance Companies, the Furniture, in the event of the Customer's death, at once becomes the property of the surviving family without any further payment whatever.

Recognising the demand for a larger and more varied selection than can well be shown at one establishment, Messrs. NORMAN & STACEY now Supplement their own Stock by giving their Customers the additional advantage of selecting their goods from some of the Best Wholesale Houses in each branch of the trade. Every Household Requisite supplied. Goods delivered free in private vans. Terms made to suit the convenience of the Customer.

NORMAN & STACEY, Ld.,

118, QUEEN VICTORIA STREET, E.C.

SELSFIELD QUARRY.

Blocks of this very durable SANDSTONE put on rail at 1s. per foot Cube. Architects should visit this quarry, only 35 miles from London.

ADDRESS:

APPOINTMENTS VACANT.

BRICKWORKS ASSISTANT WANTED
for India. Must be young, of good education, and have a general knowledge of all departments in brick, tile, pipe and pottery work, including machinery. Salary, Rs. 250, Rs. 300 and Rs. 350 per mensem, on three years' agreement. —Address, in writing, with full particulars and testimonials, to B. W. A., care of J. Vickers, Nicholas lane, London, E.C.

BOROUGH OF STRATFORD-UPON-AVON.

BOROUGH SURVEYOR.
The Town Council intend to ELECT a SURVEYOR, at an annual salary of £200 (exclusive of out-of-pocket expenses).

Applications, stating age and past experience, with not more than three recent testimonials, to be sent to me, not later than 27th MARCH instant, endorsed "Borough Surveyorship."

Canvassing will disqualify.

Definition of duties and further information may be obtained from

ROBERT LUNN,

Town Clerk.

Stratford-upon-Avon,
March 12th, 1895.

SWANAGE URBAN DISTRICT COUNCIL.

The Council are prepared to receive APPLICATIONS for the POST of SURVEYOR and INSPECTOR OF NUISANCES combined, at the salary of £100 for the first year, with the prospects of a subsequent increase.

Preference will be given to the holder of a recognised Sanitary Certificate of competency.

The names of three references must be forwarded with each application, but no testimonials.

Applications must be sent to the Clerk of the District Council at the Town Hall, Swanage, so as to reach him before NOON, the 1st day of APRIL, 1895.

THOMAS RANDELL,

Clerk.

Town Hall, Swanage,
March 6th, 1895.

THE LEIGHTON BUZZARD URBAN DISTRICT COUNCIL require a CLERK of WORKS for the Completion of the Water and Sewerage Works. Special qualification required for building.

Salary £3 10s. per week.

Particulars can be obtained from the Engineer, Mr. H. BERTRAM NICHOLS, C.E., of 59, Corporation street, Birmingham.

Applications, with three recent testimonials, to be sent to me on or before TUESDAY, the 26th inst.

By Order of the Urban District Council,

JOHN NEWTON,

Clerk.

Leighton Buzzard,
March 12th, 1895.

TERRACOTTA PRESSERS and FINISHERS and MOULD MAKERS. None but steady and first-class workmen need apply.—Address HATHERN STATION BRICK CO., Loughborough and Tamworth.

MESSRS. DEMAIN & BRIERLEY, Architects, Lendal, York, require a first-class ARCHITECTURAL DRAUGHTSMAN at once. Must be well up in Church and domestic work, and able to take charge of drawing office. Apply by letter, stating age, experience and salary required.

COMPETITIONS.

TO ARCHITECTS.

DESIGNS and ESTIMATES are invited by Mr. N. MILLER, of 95, Fishergate, Preston, Lancashire, for a proposed fireproof block of Shops, Offices, two fully-licensed Houses, &c., cost not to exceed £50,000, on an area of about 2,500 square yards.

Premiums of £150, £100 and £50 are offered (in the adjudged order of merit) for the three designs which are selected as the most suitable, and which three designs will become the absolute property of Mr. MILLER.

The assessor to be an architect of eminence, and familiar with commercial property.

A plan of the site, with instructions to Architects, can be obtained from Mr. MILLER, on payment of £1 1s., which will be returned to those sending in bona-fide designs.

All drawings, plans, sections, &c., must be sent to the Borough Engineer's Office, Town Hall, Preston, the name and address of the designer to be in a sealed envelope, enclosed with plans, &c., which will be respectively numbered, but no name, device or motto must be visible on wrapper. The plans must be sent in not later than May 27, 1895.

CHORLTON UNION.

TO ARCHITECTS.

The GUARDIANS of the Poor of the CHORLTON UNION invite COMPETITIVE PLANS for the Cottage Homes and Schools about to be erected by them at Styal, Cheshire. The Guardians offer a premium of £75 for the plan adjudged first in order of merit, £50 for the second, and £25 for the third. Sealed plans, with estimates, must be sent to me not later than Saturday, April 20, 1895.

Full particulars of the requirements of the Guardians and conditions of the competition will be supplied by the undersigned upon a deposit of a fee of £1 1s., which will be returned on the receipt of a bona-fide design.

The Builders' Journal.

The "Rip-and-tear Brigade." It is an old saying, that about friends, but it has not outworn its truth. Mr. John Burns and Mr. Tom Mann have fallen out; they have emerged from the reply courteous stage and now rely upon the retort dangerous. Indeed "the opposite of this is the truth, and Mr. Mann knows it," sounds to us very like the lie direct. But then Labour Leaders think nothing of a little strong language; it is as daily bread. This quarrel may have consequences; quarrels sometimes do. At any rate, all builders who dwell in terror of strikes may be able to see a little clear sky in this squabble. It arose quite simply. Mr. Mann fell foul of Battersea. It is not an enticing neighbourhood, we admit, but we are aware of no evidence to warrant Mr. Mann stating that "the biggest blackleg district in the trade (engineering) was at Battersea." This is a tall order, for, what with "blacklegism" and "blackguardism," the country generally is wearing a suit of sables. But Mr. Mann, of course, was delivering a speech especially designed to stir the Amalgamated Society of Engineers to floods of mutiny, and there is always a certain poetry of language permissible, only Battersea does not like the "poetry." Now Mr. John Burns represents Battersea, though some people doubt whether Battersea represents Mr. John Burns. The charm may not be mutual. But so long as this member of the Honest John Brigade is Member for Battersea, that choice suburb can do no wrong. Even the "blackleg" is whitewashed! "I am prepared to prove," says Mr. Burns, "that of the men living in Battersea there is a larger proportion of trade unionists than in any other district similarly situated, north or south. How can Mr. Mann say that Battersea is a blackleg district when a trade unionist represents it in Parliament and on the London County Council, and it has sixty-seven trade-union workmen members upon its Local Town Council." The proof is hardly conclusive. Sixty-seven, or even sixty-eight, sound unionists may be in the position of the wise virgins and their lamps. But we have no facts to disprove the rectitude of Mr. Burns' theory, nor is it our quarrel. We are not unmanned. It is quite within the bounds of possibility that Battersea is all Mr. Burns (and our imagination) would picture it; but, even here, we presume there are reservations, for quite a decent number of people—if they were not of the elect—

voted against Honest John at the recent County Council Election. How was that? Is it possible that these were "blacklegs?" If so, there are some thousands of them, which rather proves Mr. Mann's heated view. Because we cannot understand why, Battersea being what it is (according to Mr. Burns) there should be such diversity of opinion. Mr. Tom Mann is the Secretary of the Independent Labour Party and an authority on "Amalgamated Engineering" matters, to boot, and he might know what he was talking about, though we are not sure. But Mr. Burns goes into detail, and is more explicit. "Battersea is the pioneer in direct employ-

A LITTLE BIT AT BUCHAN HILL.
ERNEST GEORGE AND PETO, ARCHITECTS.

ment of labour; it has secured for its municipal employees, numbering upwards of 500, the eight-hours' day, with no reduction of wages; established labour bureaux and relief works for the unemployed, and in its general labour and trade union policy excels all other districts." We hope there will be a general rush to Battersea, for it would seem to be the long sought haven of rest. In winding up his vigorous criticism of Mr. Mann, Mr. Burns (we use the prefix advisedly, hoping against hope!) says: "The Government has in two years reduced the working hours to eight per day of 40,000 people in its employ, a large proportion being of the engineering trades. It has

almost abolished overtime, and in other ways made great administrative and industrial changes in its conditions of employment, whilst recently contractors have been and are being levelled up to trade union conditions. Who has played the most prominent part in this achievement? Not the Independent Labour Party rip-and-tear brigade, but certainly the officers and prominent members of the Amalgamated Society of Engineers, whom Mr. Mann now charges with lack of vigour. In fact, the object of Mr. Mann's speech on behalf of Mr. Barnes was to disparage all other candidates for the position of General Secretary, and to cast reflections on active, honest, non-political officers who will not subordinate the interests of our great society to the shibboleths of the Independent Labour Party and its intolerant leaders. Are we to see introduced into trade unionism the 'spoils to the victor' system? Are we to have executives besmirched, and long, honest, and devoted services cast away? And for what? Simply because Mr. Mann, for the fiftieth time, has changed his social, political, and industrial course, and in the light of this change wishes Mr. Barnes to be the general secretary of the A.S.E.; not because Mr. Barnes is better qualified than others, but because he is for the moment a political friend and ally of Mr. Mann." "Intolerant leaders" from the pen of a Labour Leader is good, but "rip-and-tear brigade" goes a mighty one better. There exist certain thinking and cool-headed people who class both sides to this savage squabble, as of the "rip-and-tear" order.

The Building Exhibition. WE are glad to think that the International Building Exhibition of 1895 will be far and away the best of the series yet held in London, and if the improvements which we shall suggest a little later, be well considered, there is no reason why these exhibitions should not continue to be of much interest and usefulness to those persons who delight and find profit in institutions of the kind. What we are sorry to see is, that many firms idly imagine that a hundred or a couple of hundred pounds lavished on the construction of a stall adds to the reputation of their exhibits, or to any appreciable advance in the business which they serve. This is entirely against the spirit and usefulness of these shows; in our opinion against the welfare of the exhibitors. We should like to see a rule enforced at all future exhibitions, that no goods can be admitted for exhibition later than forty-eight hours prior to the moment of opening. Nothing detracts from the

interest of visitors so much as incompleteness due to the want of energy of many stall-holders. The Royal Institute of British Architects has countenanced the exhibition by allowing many models and drawings to be removed from Conduit Street for exhibition in the Hall. It has also nominated, through its Science Committee, gentlemen to act as judges in the several craft competitions. In the list which has been forwarded to us are many men well able to act in the judicial capacity. We wish the Exhibition the utmost measure of success.

"Peacock" Painters. WE read the other day, in an evening Journal somewhat irresponsible on art matters, of a witty artist painting peacock feathers on a ceiling, what time he lay upon his back. It all seemed very wonderful—on paper—and we still gazed, and more our wonder grew when we came to the passage in which Mr. Whistler's "brush" was described. We are not quite sure whether it was at the end of a clothes-prop, or attached, say, to a common whitewash brush, but the result was equally ridiculous. The parlourmaid's bamboo dusting brush might have done as well. It is time these little fabrications of genius came to a full stop. But the picture of the Impressionist in that attitude came into remembrance when we read the judgment in the French Courts upon the Eden matter. It struck us that Mr. Whistler

A SKETCH BY BANISTER FLETCHER.

was again "floored"—in a different sense. Whatever may be thought of the merits of Mr. Whistler's picture, there can be no doubt about its novelty. The trunk of one lady—to use the slightly objectionable word common in the case—with the face of another, is a pure Caprice, neither Nocturne nor Interlude, and Mr. Whistler has never done anything more funny. Whether Lady Eden likes herself under the new arrangement, whether Sir William has become charmed by the face of "Miss Hall," and whether Miss Hall was entitled to claim "her own," or, at least, a replica of herself, are points outside the issues, in the first two counts, and decided in the negative so far as Miss Hall is concerned. The picture may be *her*, but it is not "*hers*." Neither is it Mr. Whistler's, for he sold it, and received his hundred guineas. Neither are the hundred guineas his, for Sir William's order of a portrait of Lady Eden has not been fulfilled. Finally, Mr. Whistler having "damaged" Lady Eden (we wonder what Miss Hall would say to this!) must pay 1,000*l.* and a penalty if he further delay delivery. To make the severity complete, Mr. Whistler must not again touch the portrait. After all, people, even painters, may leave England and fare worse. We may be "Philistines," but British juries have a secret sympathy for artists; they make allowance for eccentricity and stand somewhat in awe of genius. Not so in France. Mr. Whistler having fore-sworn America, and found Paris unkind, may wander back to England—home of the persecuted and the alien. He and Mr. Wilde are Adversity's bedfellows.

THE Town Council of Crieff purpose erecting a hospital for infectious diseases at Alickmore at a cost of £1,000.

NOVEL WAY OF VENTILATING A TUNNEL.

THE Simplon Tunnel is now being constructed between Switzerland and Italy. This tunnel, when completed, will be 12½ miles long. The nearest tunnel, from a longitudinal point of view, at present is the St. Gothard, which measures 9½ miles, then comes Mont Cenis, 8 miles long, and the fourth is the Hoosac, 4½ miles. According to the proposal of the engineers in charge of the preliminary work, the two tracks will not be carried in a single large tunnel, but in two small parallel lines, about 58 feet apart between the centres, and connected every 660 feet by cross-cuts. The average area of the section of each of the tunnels is estimated to be 250 square feet, the width and height will be 16 feet and 18 feet respectively. The plans of the contractors are quite different from the general methods which have been hitherto adopted. This change is due to a stipulation in the contract, providing for the completion of one of the tunnels first, and the construction of a working gallery along the line of the second immediately afterwards. To meet this stipulation the directors have decided to drive two galleries from each end, as the basis of the two tunnels, and to connect them at equal intervals. One gallery will be enlarged to the full cross-section to form the first tunnel, while the second tunnel will only be completed when the first is not sufficient for the traffic. The clear section of the second gallery will be used for ventilation, and will have an area of 86 square feet. Air will be blown into it by powerful fans, and elaborate arrangements will be made to pass it in through the second, so as to come out through the second gallery. Both galleries will be driven by Brandt hydraulic drills, three or four at each heading, and it is calculated that the progress made with them in the work will be at the rate of nineteen feet a day. It is also stated in the report that considerable time will be saved by reason of recent improvements in explosives, and by the new method of throwing the blasted rock backward with hydraulic power at the moment of the explosion. The rock, instead of lying within a few feet of the face, will be scattered for some distance, and the drills

[CLOSE GATE, SALISBURY.]

can be set up again in a shorter time. The tracks laid for carrying rock and supplies in and out of the galleries are connected through each cross-cut, and have a gauge of 2 ft. 7½ in. For doing this work the contractors are to receive £1,808,000 when the first tunnel and the second gallery are complete, and if this part of the undertaking is not completed before the end of 1900, they are to be fined £200 a day for the remainder of the working period. There is a previous payment of £290,000 when the power plant and other apparatus for working are set up; but the large payments are not due until the first tunnel is ready for regular traffic.

SOCIETY MEETINGS.

Edinburgh Architectural Association.

The members of the Edinburgh Architectural Association recently visited the village of Upper Liberton, and were conducted over Liberton House, the former residence of the Littles, the owners of the Barony, by Mr. G. Godfrey Cunninghame, the present occupant, who directed the attention of the party, in the first place, to the ground plan of the house, consisting of two blocks of buildings at right angles to each other, with a circular turret or tower in the angle, these, together with another block or annexe, enclosing on three sides a small square courtyard, the fourth side of which was once shut in by a wall and gate of defensive character. Special interest attaches to Liberton House in the fact that it belonged to a transition period, when defensive architecture, even in the case of structures without any claim to rank as a castle or fortress, had not yet been wholly abandoned, and when the state of society made it necessary to retain safeguards against sudden attack. Though disfigured externally by an alteration in the height of the walls, which had been considerably raised, and in the pitch of the roof, which had been depressed, the outlines of the original elevation were still clearly traceable. Lastly, the "Nelson room," a reconstruction of recent date, was explained to be an attempt arising out of structural considerations to introduce the half-timbered work associated, at least in Scotland, more often with the exterior than with the interior of the edifices in which it occurs.

Architectural Section of the Glasgow Philosophical Society.

This Society held its last meeting of the session on the 18th inst., Mr. T. L. Watson, F.R.I.B.A., President, occupying the chair. Mr. Lewis R. Crosskey, of Glasgow Technical College, read a paper on "Industrial Art, with special reference to the Training of Artisans." He said, the art instruction given at industrial art classes must bear directly on trade requirements, and could only be given by men having a complete knowledge of the trade. It must be given by one in close touch with the trade to which the student whom he is teaching belongs. Mr. A. Lindsay Miller, in supporting the view of the municipality helping trade technical schools, said, they could not in this country equal many varieties of German-made goods, and the secret of it was the splendid system of technical instruction carried on in special schools by the Government of that country. Mr. T. L. Watson was re-elected as President, Mr. William Howatt as treasurer, and Mr. A. Lindsay Miller as secretary.

Institution of Civil Engineers.—At the ordinary meeting of the Institution on the 19th inst., Sir Benjamin Baker, K.C.M.G., vice-president, in the chair, a paper was read on "Steam Engine Economy—Condensing Engines," by Mr. Henry Davey, M.Inst.C.E. Development of the Experimental Study of Heat Motors is to be the subject of the "James Forrest" lecture this year, the lecturer being Professor W. C. Unwin.

Civil and Mechanical Engineers' Society.

At the recent ordinary meeting of the Civil and Mechanical Engineers' Society, Mr. S. à Court, A.M.Inst.C.E., Vice-President, read a paper on the subject of "Passenger Lifts." Referring to the earlier forms of passenger-lifts in use in England, the author gave details of various improvements lately introduced, and gave figures to support his view that at even present prices the electric lift is a serious competitor with the hydraulic lift. Possible causes of accidents were then detailed, also safety appliances, &c. The author said that the percentage of accidents was very small, considering that something like ninety millions of passengers were carried annually in London alone.

BUXTON Wesleyan Chapel is undergoing extensive alterations. A chancel is to be formed, with seats for the choir, and the pulpit will be placed at the north side. A new organ is to be built at a cost of £750, and the total expenditure will be about £1,200.

RECENT STRUCTURAL ALTERATIONS IN THE HOUSE OF COMMONS.

A SELECT Committee of the House of Commons was appointed last year, to consider any or what arrangements could be made to improve the accommodation provided for Members and Representatives of the Press. Conformably to custom, this consideration was duly given, and the usual recommendations were made. The latter were also promptly carried out. This, however, is not according to custom, since Select Committees are proverbial for a seemingly incurable dalliance and delay. We are pleased to credit such a body with the best of intentions, and with almost immediate results. The Select Committee on the House of Commons' accommodation has been prudent enough to avoid suggested "building courses" that would have merited condemnation. It will hardly be affirmed that the Houses of Parliament, at which some members now-a-days scoff because it does not satisfy every idiosyncrasy, is a flawless structure. But that the design of Sir Charles Barry's masterpiece is "gingerbread," though the material of which the building is composed may be imperfect, is an untruth, apparent to any being who is not bereft of all architectural instinct. At any rate, if some parts of its exterior be open to criticism, it was generally apprehended that little room remained for amendment or improvement in its beautifully proportioned chambers and lobbies. The counsels of the Select Committee in question show, however, that there exist unappreciative and unreflective legislators who would raise the chambers and build them over again; but fortunately financial considerations and the good sense of the remainder and majority of the Committee prevented the defacement of Sir Charles Barry's designs.

It appears that having come to the conclusion that it was undesirable to build a new Chamber, Mr. Plunket, the Chairman of the Committee, was commissioned to interview the authorities of the House of Lords to ascertain whether by re-arrangement additional space could be secured to the House of Commons. The Upper Chamber was complaisant; it was not surcharged with a fierce desire to thwart the wishes of the People's Representatives. It allowed the three rooms occupied by the Railway Commissioners and three of its ground-floor terrace rooms to be given up to the House of Commons, whilst Mr. Peel, the retiring Speaker, consented to the removal of his train bearer from his quarters. These concessions provided the basis for the rearrangement and alterations which have recently been completed. In the economy of the Parliamentary Representatives gastronomic needs take high place; it was, therefore, natural that the culinary conditions should prove to be defective. It was at first proposed to transfer the kitchen to the old committee rooms at the top of the building, the proper place for the kitchen if practicable. But there were drawbacks and difficulties. The alterations would take too long and cost too much—some £15,000 to £20,000; it would, moreover, be difficult to serve dinners on the ground floor as well as on the main dining room floor, and the work of the Committees underneath might be interfered with. The kitchen accommodation has, therefore, been entirely remodelled by building into the Common Inner Court, absorbing the rooms formerly occupied by the assistant engineer, and by utilising and redistributing the old kitchen space. The former Members' dining room has been converted into a service room, with four lifts working in direct communication with the kitchen, the grill from the large dining room having been removed into this room. The Members' large dining room has been restored by setting back the screen and the removal of the grill, and the main floor smoking room

has also been converted into an additional dining room. The room hitherto employed as a ladies' dining room has been put to use as a dressing room for members, and equivalent dining accommodation for visitors has been provided by the conversion of one of the minister's rooms adjoining the Terrace and of the Terrace reading room into visitors' dining rooms. Another minister's room on the Terrace has been allotted to the manager of the refreshment department, who gives in exchange to the minister the room which he formerly occupied. The "E," or Grand Committee room has been appropriated to members as their principal smoking room, and the Terrace minor smoking room has been divided into two rooms. In addition to the converted dressing room for members, seven cubicles have been fitted up for dressing in, whilst in the adjoining chamber a hair-dresser has been established. On the opposite side of the passage four baths have been constructed. The Standing Committee on Law is to be accommodated in the large room at the north-west corner of Westminster Hall, which room is to be available, when not required by the Committee, for members' private secretaries. The evicted Railway Commissioners have been provided with accommodation outside the house, and half the space previously in their occupation is now set apart for the use of members receiving deputations or holding conferences,

CROWLAND BRIDGE.

in addition to one of the former conference rooms, the second of which is to be allocated to that modern institution, the type-writer. The octagon room is also to be put to conference purposes on arrangement with the assistant serjeant-at-arms. The four rooms surrendered by the Speaker's train-bearer have been allotted as follows:—One to the librarian in lieu of that at the foot of the Ladies' Gallery staircase, given up for a ladies' waiting room; one to the chaplain in place of that handed over to the press; and two have become ministers' rooms in compensation for those required in connection with the revised dining accommodation for visitors. The other half of the space obtained from the Railway Commissioners has been assigned to the Examiner of Private Bills. The assistant serjeant-at-arms has moved into the examiner's rooms, and the assistant engineer has been housed in the rooms secured from the House of Lords. A room for boy messengers, as well as additional accommodation for the police, has been provided. The post office has been enlarged by the addition of space from under the staircase leading to the gallery of the House, and additional windows have been opened to the lobby for the convenience of members. Better accommodation has been given to the maid-servants occupying the old committee

rooms, by the division of one of the rooms and the provision of a bath-room. A barrier rail has been placed at the back of the bench in front of the strangers' seats, to facilitate the arrangements made for allowing strangers sitting under the gallery to remain during divisions. The electric lights in some of the principal rooms and library have been placed at a higher elevation and redistributed, in order to diminish the glare of which members used to complain. A glass and iron shelter has been erected at the external entrance to the ladies' gallery, and electrical communication has been established, as an experiment, between the House and the new smoking room (formerly the Grand Committee room). The foregoing are the alterations made, mainly, in the interests of members. The other changes benefit the Press and its staff of messengers. New entrances to the reporters' gallery have been constructed at each end, and the collisions and inconvenience which resulted from the reporters converging from each side of the gallery to the central entrance on going out and with those incoming, are now obviated. The reporters' kitchen has been enlarged by the addition of a tea-room. There has been a reservation of the upper corridor for the Press. Two small smoking rooms have been thrown into one. The *Times* staff, which has this session been increased for the purpose of preparing the Hansard Debates, has been transferred to the room hitherto in the possession of the Chaplain of the House. Last, but not least, the room which is on the site of the once famous Star Chamber, has been given over to the boy messengers of the Press. Thus the whirligig of time brings its revenges. The alterations have cost close upon £20,000.

PLASTER WORK IN PARIS.

THE plain plasterer in Paris is inferior in skill to an average plasterer in London, or even to the men of some of our most secluded towns and villages. They do their work in a different way, and when accomplished it is inferior, having a bad line and uneven surface. Plaster and sand are the principal materials used on walls and ceilings. No lime and hair-mortar seem to be employed. This method of working is very slow, judging from the amount of work done by five men in half an hour, during which time I watched them. I can safely say that these men, who appeared to be a fair sample, would not be equal in efficiency to three ordinary plasterers in London, whose work, when finished, would be superior to that of the Frenchmen. I do not judge alone from what I have seen, but also from the answers I received to many enquiries in other places, where men were at work. But, although they are inferior in their method of work, they have many good qualities which it would be advantageous to Englishmen to learn. The French plasterer's tools are clumsy in the extreme, ill shaped, and heavy. It seems to me to be all but impossible for men to produce good clean work with such implements. In all the buildings that I examined I did not find anything extraordinary with reference to plain plastering; on the other hand, in reference to ornamental plastering it must be said that every building seemed to excel its neighbour in the quantity and quality of enrichments, which are everywhere introduced with consummate taste, with just proportion, and in good keeping. This seems one of the principal advantages that has been gained in the buildings in Paris. Ornament is before the eye wherever it turns, either in wood carving, in stone, in marble, plaster or other composition, and, notwithstanding the great quantity of ornament, there is none that seems overcrowded or misplaced.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
26th March, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

YET another unfortunate attempt on the part of the London County Council to interpret the law as it is understood at Spring Gardens. Mr. J. Gover is a builder. The complaint against him, made at "Marlborough Street," was that he opened windows in a party wall. The defence was that the wall could not be called a party wall, as it stood upon land absolutely belonging to the defendant, and that the new window had been opened with the consent of the owner of the property adjoining. The wall, for a certain portion of its height, might be so far regarded as a party wall as it was built against the wall of the adjoining premises. Above that building it was an external wall, and was, therefore, outside the provisions of the Metropolitan Building Act. Mr. Hannay, in giving his decision, said there was nothing in any part of the Act to support the Council's contention, the wall in dispute being, where the windows were placed, an external wall. In fact, there was nothing in the Building Act, or any reported decision, to make it a party wall in law. He, therefore, dismissed the summons, and awarded ten guineas as costs to the builder. The County Council evidently cannot understand its own Act, and Sir John Bridge and Mr. Hannay are comrades in the conflict. But the fight is unequal. The Bench will prevail while the Council will go by the board. But we would suggest that a little night-schooling might do the Council good, to begin, say, with Latin: "Balbus is building a wall!"

It will interest art-folk to learn that this year Mr. J. W. Waterhouse will exhibit the most important picture he has painted for some time. The subject is "St. Cecilia," and the motive is supplied by the lines from Tennyson's "Palace of Art." Two angels, both playing viols, are kneeling before the sleeping Cicely, who is placed on a large stone chair, some illuminated music on her knee. The angels are on the carpet before the "gilded organ-pipes"; cypresses and other Italian trees are in the landscape, and beyond is the sea with many masts of much shipping. This highly decorative theme is finely treated, and the figures are larger than those usual with Mr. Waterhouse.

ANOTHER Artist who is wandering a little from the old pathways, is Mr. Marcus Stone, who will exhibit at the forthcoming Academy a picture of a somewhat different *motif* from those in recent years. He calls it "The Sailor's Sweatheart." A delightful cliff garden is bounded by an old broad grey wall; a fair girl with a beautiful face and figure leans on the wall and gazes fixedly over the sea beyond. The costume is of the last year of the last century, in white muslin, and she

wears an old-fashioned straw hat; in her hand is a bunch of forget-me-nots and his letter. A cat sleeps on the wall. In the shadow are the young lady's father and mother, who look up from their work and newspaper respectively with half-amused, half-sympathetic tenderness. Out beyond is a landscape, and beyond that, again, the sea. The "story" needs no further telling.

EAST LONDON may awake to hear that it is proposed to hold an East London Trades, Industries, and Arts Exhibition at the People's Palace next year. The preparations are far advanced so far as financial help and "influence" are concerned, though the projectors of the scheme would have done well to add the names of a few representative workmen to the long list of distinguished persons who form the Committee. Several of the City companies are taking the matter up, and so are many of the big employers of labour in East London, whilst the presence of the President of the Royal Academy on the committee shows that something is to be done for art. It is surprising how fond the East-End is of pictures; you have only to go to Bethnal Green Museum on a Saturday night to see and hear something worth remembering, including many naive comments on art.

THE weather is biggest Vandal of all, exceeding in strength the rude blow of revolution or that murderous "restoration" process, the ruin of so many fine fabrics.

A VILLA: BY PROFESSOR BANISTER FLETCHER.

We hear with regret that the unrivalled façade of the Louvian Hôtel de Ville has been seriously damaged by the weather. The magnificence of this Gothic town hall has long excited the wonder of architects and students, and though Belgium is so rich in buildings of the kind, not one of them surpasses that of Louvian in wealth of superb detail. The hall is of a later date than the not less famous Hôtel de Ville at Brussels, and it is a tradition that the citizens of Louvian, jealous of the fame of the municipal palace of the neighbouring city, determined to have a building of at least equal magnificence. The "master of the works" was Mathieu de Layens, who was engaged at the time as city architect, and he seems to have prepared the plans as part of his ordinary duties. The city archives reveal the fact that all that he got for the design was five crowns, the equivalent of about thirty-five shillings of our money. The building underwent an elaborate restoration between the years 1829 and 1841 under the direction of MM. Goyers and Everaerts, but the stone used was so friable that further repairs are already absolutely necessary, the walls of one of the towers having recently almost crumbled away. The authorities have accordingly decided that the venerable building shall be once more "restored," and the necessary credits have been already voted.

WITH the advent of building weather, the work at the Empire of India Exhibition, Earl's Court, is being rapidly pushed forward. Over 2,000 workmen are employed on the extensive plans laid out by Mr. Imre Kiralfy, and which now begin to assume definite shape. On the old arena side of the grounds the work is well in hand. The decoration of the Queen's Palace—a building 500 ft. long, to be devoted to Fine Art—has already commenced, while the Ducal Palace, the Hall of the Rajahs, and other buildings are nearly completed. One thousand four hundred native artisans will reach England early next month.

ONE by one the links with the past are breaking. The death of Mr. H. G. Hine, the venerable Vice-President of the Royal Institute of Painters in Water-Colours, removes another name from the diminishing band of water-colour painters whose feeling and sympathy are more in touch with a past generation than with modern cults and schools. As his colleague, the late Thomas Collier, carried forward the traditions of Cox and De Wint, so Mr. Hine's sweet and poetical pictures of downs bathed in sunlight may be said to be founded on the art of Copley Fielding, though with a certain solidity and absence of mannerism that Fielding never attained to. Mr. Hine was an octogenarian, but died at work, painting, even in his later years, with a feeling for purity and delicacy of colour very remarkable, if not unique, in a man of his advanced age. It will not be easy to find a worthy successor to this laureate of the Sussex Downs.

THE Galleries, private and public, are very busy just now, and the respective shows claim their daily little "crowd." At Messrs. Dowdeswell's Mr. Denovan Adam, of the Royal Scottish Academy, who has been working extensively amidst some of the finest scenery in the North, is exhibiting a kind of artistic almanack of weather. Each month, from January to December, has had special attention devoted to it, and nearly every canvas contains its rough Scotch cattle, without whose presence this artist would scarcely seem represented on his own ground. Mr. Adam is a colourist who delights in brilliant contrasts and strong harmonies. At the Carlton Gallery, a collection of paintings by Mr. C. E. Johnson, the well-known Member of the Institute and exhibitor at the Royal Academy, may be viewed. They consist of picturesque landscape scenery in England, Scotland and Wales, selected with the artist's customary observation of different atmospheric effects. Besides Mr. Johnson's landscapes, Messrs. Borgen and Turner are showing one of the last productions of the late M. Meissonier, namely, "Le Postillon," exhibited at the Salon of 1893.

THE earliest remaining work in York Minster, said Mr. C. F. Mills, at Toynbee Hall, was the Norman crypt of Bishop Roger. It was a typical English church, with square, not apsidal, ends, lofty lancet windows, and three towers—the two western towers and the great one in the centre of the building. York, too, was exceedingly rich in quaint gargoyles. The great west window was much the finest in England, though that at Carlisle was said to be more perfect. The real magnificence of York was only revealed beyond the screen and in the great choir. A peculiar beauty of York, which it possessed, in a higher degree, perhaps, than any other of our great fanes, was the effect of colour from the stained-glass windows, so exquisite in the play of the rising and falling light. Perhaps we did not appreciate Perpendicular architecture enough in the opportunities it afforded for great windows. The ideal it aimed at seemed to be a translucent tabernacle

ribbed with stone. The Chapter House at York was singular in having no central pillar like other buildings of its kind. Another remarkable architectural feature was the triforium, the passage along which was outside, and not inside, the cathedral.

By the way, the Easter Exhibition of Pictures at Toynbee Hall will be opened this year by the Right Hon. A. J. Mundella, M.P. Briton Rivière will be the artist principally represented, but the committee have been successful in securing such pictures as Alma Tadema's "Shrine of Venus," Peter Graham's "The Gently Heaving Tide" and "Evening," Sir Frederick Leighton's "Dædalus and Icarus," and Hubert Herkomer's "God's Shrine." Burne Jones, Vicat Cole, H. W. B. Davis, Fred Walker, MacWhirter, David Murray, Henry and Albert Moore, Clausen, Wyllie, are artists whose principal works East-enders will be privileged to see, and a fine landscape by Corêt, the great French painter, will be a feature of the exhibition. The exhibition will be opened on April 2, and remain open for three weeks.

ONE who evidently knows something of the practical side of things, writes with regard to the proposed harbour at Dover: It is rather surprising to learn from the discussions which have taken place upon the proposal by the Government to construct a national deep-sea harbour at Dover, that it will cost some £5,000,000. In these days of steam appliances and long experience in the construction of such works, it will be found that that sum of money will construct two first-class harbours on the lines of the scheme of 1844, and in addition dry and wet dock accommodation, all on reclaimed land. A sum of £2,500,000 will be found sufficient to provide a harbour on the lines of the scheme of 1844, of an area of say 500 acres at least, reckoning from low-water mark, including half-a-dozen graving docks, and splendid accommodation in the shape of wet docks, where vessels fitting out or under repair can lay in 30 ft. of water at all states of the tide. Another question is that of time, which has again been variously estimated. There have been large harbour works constructed quite lately of a first-class description, and at a rate of speed which would certainly justify the assertion that the 1844 scheme might be completed in from twelve to fifteen years with perfect ease and economy.

THE design of the medal to be issued by the Corporation of the City of London to commemorate the opening of the Tower Bridge has been executed by Mr. Frank Bowcher, of 6, Clifton Hill Studios. On the obverse are the portraits of Her Majesty the Queen and, their Royal Highnesses the Prince and Princess of Wales, in bold relief, and on the reverse a perspective view of the Bridge with the City Shield in the exergue, while the Bridge House mark may be seen above the towers. The medals bears the inscription, "The Tower Bridge, opened 30th June, 1894, on behalf of Her Majesty Queen Victoria, by H.R.H. the Prince of Wales." Mr. Bowcher has had the honour of submitting the model to H.R.H. the Prince of Wales, who has been pleased to pass a favourable criticism upon the portraits.

THE splendid collection of gold ornaments and gems in the British Museum will shortly be transferred to and re-arranged in a new room which is now being fitted for them, and where, with improved light, they will be seen to far better advantage. The greater portion of the gems will be displayed in a large centre case. Surrounding this central case on three sides will be three lines of connected table-cases. Those on the north side

will contain a series of archaic gold ornaments from the Greek islands; the celebrated glass vase popularly known as the Portland Vase will be placed above. On the west side will be arranged the archaic Greek island gems and the scarabs, and also the later Greek and the Roman gems. The choice collection of mediæval goldsmiths' work and enamels will be exhibited in a case on the south side, and above will be placed the very remarkable Royal gold cup acquired in 1892. The cup weighs nearly 68 ounces, and in its present condition measures nine inches in height and is seven inches across the cover. The cases lining the walls of the room will contain ancient and mediæval gold ornaments, including an extensive series of finger rings of all periods; while above these will be exhibited a series of frescoes from Pompeii, Herculaneum, and Rome.

LIFE is not absolute heaven in a flat, particularly if the man in the "let" above snores. We commend an interesting point of law, recently raised before Mr. Curtis Bennett, to the attention of all flat builders. A young man lived in a flat; above him lived one who snored like an ox, so that he could not sleep. The legal question is this: Are we to hold in the young man's case that the

LADYWELL: BANISTER FLETCHER, ARCHT.

man above him snores, or that the landlord sleeps? The young man wanted a summons against the landlord. He added that he could not sleep for three years in the kitchen. If this means three years on end, the contention seems valid; if it means that he will lie awake there three years before dropping asleep, it seems improbable. But Mr. Curtis Bennett could not satisfactorily settle the question. Only a wide-awake man can settle a "snorer."

MR. ACLAND, Vice-President of the Council, struck a bright and happy note in his address at the laying of the memorial stone in celebration of the rebuilding of the larger portion of the Woolwich National Schools. In these days of crowded populations and much poverty, which was so difficult to grapple with, the more they could make their schools bright and healthy places, whatever the character of the homes of many of the children might be, said he, the more they were doing for the benefit of this and future generations. Light, warmth, and a good atmosphere and bright surroundings were essential to the effective carrying on of the great work of national education. Many people thought the Education Department was a mechanical institution, and that there were no human beings inside it. That was

not so, for the officials took a deep personal interest in their work, and every word of encouragement they received helped them to become more elastic, to get rid of red tape, and to become more human in all that they did. The humanising of officialdom is a useful work, in which others beside Mr. Acland might well engage. The "department" still lacks "heart" and sympathy. Mr. Acland's words may be regarded as a sincere, if slow, awakening.

MR. WALTER CRANE has made a set of eight pen drawings to illustrate the "Merry Wives of Windsor," and they have been published in an edition *de luxe* by Mr. George Allen. These form the continuation of the series by the same artist illustrative of Shakespeare. Mr. Crane has many aptitudes as an illustrator of Shakespeare. One of them is a sense of archaic quaintness. Another is a sense of character. Master Slender looks the fool that he is. The merry wives never lose their sense of the joke, and the fat knight is manifestly stuffed with the meaner vices. The manner of execution is large and free-handed, and it has to be so, in the treatment of the figures, to counteract what would otherwise be the excess of delicacy of detail in the backgrounds.

CITY clerks are asking why they should not have a little "Factory Act" legislation. It certainly seems an anomaly that while so much is done for the belligerent workman, the quieter clerk gets small heed. He has been too concerned with his living to pay much regard to sanitation hitherto. But the National Union of Clerks is now awakening to the situation. A deputation waited upon the Home Secretary the other day, and urged that some such protection as that afforded in factory legislation should be extended to clerks, especially to junior clerks in the entering rooms of City warehouses, who have often to work excessive hours in over-crowded, badly ventilated rooms, and without proper sanitary accommodation. Mr. Asquith said the grievances as to overcrowding and insanitary conditions did not belong to his department, but came within the public laws of health, and they might have these laws more rigorously enforced by giving information to the local officers of health, or by bringing pressure to bear upon the local authorities. The question of excessive hours of work by clerks in warehouses was not dealt with expressly by the existing law, and could not well be included within the scope of factory inspection; but he would endeavour to ascertain whether the alleged evils in that respect widely prevailed, and would consider what could be done under the circumstances. This was somewhat cold sympathy. Mr. Asquith never forgets to speak like a lawyer.

A GLASS case, containing neither gold, jewels, nor objects of art, yet said to be worth £10,000 was recently one of the attractions at the Royal Institution. The contents were a variety of globules and cast bricks of unpretending appearance, used to illustrate Professor Roberts-Austen's lecture on the rarer metals and their alloys. A slab of palladium, the largest in the World, was valued alone at £7,000. Professor Moissan in France and Mr. Claude Vautin in England have, by different methods, succeeded in reducing and casting these highly infusible metals, most of which have hitherto been seen only in minute and precious fragments; but whereas M. Moissan with his electric furnace has never succeeded in eliminating carbon from his products, which are, therefore, really carbides, Mr. Vautin, by the ingenious use of finely-divided aluminium as a reducing agent, can produce large quantities of almost any one of the metals from their

oxides in an absolutely pure condition. The value of these metals, even if they could be produced commercially on a large scale, is still doubtful, although indications of their usefulness are not wanting. Chromium, for instance, has made a revolution in steel projectiles, while aluminium threatens to become a popular craze. The experiments conducted at Woolwich, under the supervision of the Ordnance Director, shew, moreover, that we may expect from these metals with high fusing points the peculiar power they possess of strengthening other metals. The results obtained in this direction by alloying with such metals as titanium, tungsten, palladium, and osmium, afford grounds for a new generalization in metallurgy.

A MONUMENTAL stone has just been placed in Peterborough Cathedral, over the spot where the remains of Queen Katherine of Arragon were buried on the north side of the chancel. The cost has been defrayed by the "Katherines" of England, Scotland, Ireland, America, and others, Mrs. Clayton, wife of Canon Clayton, being one of the originators of the movement. The inscription is as follows:—"Here lies the body of Katherine of Arragon, Queen of England, and first wife of Henry VIII., who died at Kimbolton Castle on the 8th day of January, 1535-6, aged forty-nine years."

MR. SHAW-LEFEVRE'S suggested method for getting at the Water Companies was ingenious. The Local Government Board may hold an inquiry and order improvements to be made "if at any time complaint as to the quantity or quality of the water supplied by a company in London for domestic purposes was made to the Local Government Board by memorial in writing, signed by not less than twenty inhabitant householders paying rents and supplied with water by a company." The expense to be incurred would simply be that of appearing as witnesses, and the outcome might well be that the companies would be compelled to relay their pipes, or protect them in such a way that the frost could not penetrate them.

IRONWORKERS and others, with a taste for armour and arms, gathered to the sale at Christie's of Mr. Edwin J. Brett's famous collection. It was some time since these auction rooms contained such an array of warriors' suits, old helmets, pistols, daggers, spears, and battle-axes, many of them rare in form and remarkable as to workmanship. Particularly noticeable were two fine suits of engraved armour of the sixteenth century, uncommon in design and much ornamented; a rare tilting heaume of the fourteenth century, similar to the one that hangs over the tomb of the Black Prince, in Canterbury Cathedral; a sallad, with movable visor, somewhat like those worn by the Nuremberg patricians, Stephen and Lucas Baumgartner, in their portraits by Albert Dürer, in the old Pinacothek, at Munich; an Italian wheel-lock gun, the stock of which is minutely inlaid with the story of Perseus and Andromeda and other classical subjects, besides elaborate ornamentation of flowers, fruit, birds, &c., made in 1560; a sixteenth century morion of bright steel, embossed on one side with a Roman equestrian combat, and on the other Cæsar being offered the head of Pompey, after the defeat of the latter's army at Pharsalia; a circular shield of blued steel, finely inlaid, and an armet, which is probably one of the earliest types of closed helmets (1490). The collection was full of quaint and rare things.

ARCHITECTS and builders will be interested in the accounts which are appearing of the enormous preparations for the exhibition to be held at Nijni-Novgorod in 1896. It will be the greatest show of its kind ever held in

Russia, and its purely national character will give travellers from the West a better idea of Russian life than any number of books. The buildings will cover an area twice that occupied by the last Moscow exhibition, and twelve of the sections have already been completed, viz., the Central Building, the Concert Room, the Military and Naval Section, the Scientific and Scholastic, Bird-rearing, Forestry, Fruit Culture, Agricultural Machinery, Handicrafts, Trade and Navigation, Siberian, Central Asian, and Caucasian Sections, and the offices of the Administration. The remaining buildings will be ready in the autumn. The exhibition and town will be illuminated by the electric arc and incandescent lights, and an electric railway and a service of balloons will convey visitors from one side of the Volga to the other. The cost of the lighting, railway and balloons is put at £20,000. What the exhibition buildings will cost is not stated.

WITHIN ten years, it is said, the city of New York will be heated and lighted, have all its machinery driven, and its laborious work done, by the utilisation of the forces of Niagara Falls. The idea has long been a dream. But two difficulties have always stood in the way—first, the purely mechanical obstacles to turning any part of so strong a current into electrical energy, and, secondly, the impossibility of profitably conveying electricity any great distance from the place where it is generated. The first of these has been

STABLING AT CHURCHILL:
BANISTER FLETCHER, ARCHITECT.

overcome, and there are now on both sides of the Falls great works in course of erection that will generate, between them, electricity equivalent to three-quarters of a million horse-power. What this means may be judged from the fact that, a few years ago, it was officially estimated that all the machinery in New York State only amounts to 450,000 horse-power. The problem of transmission is a more serious one. The highly elusive character of electricity causes it to escape at every possible point, in spite of the most careful insulation. Mr. Nicolas Tesla, Edison's young rival, believes he has at last hit on a plan by which electricity can be conveyed several hundred miles without appreciable loss. If this problem of transmission is really overcome, New Yorkers and others will, it is said, have the forces of Niagara laid on to their houses for every-day use at a cost of less than £3 each horse-power a year.

AN interesting collection of sculptures in bas-relief gathered by Mr. E. P. Maudslay has been presented to the nation. From an art point of view the attraction of these bas-reliefs is not great, though they have much that is characteristic of primitive South American sculpture. One of the most notable pieces probably formed part of a flight of steps, and represents some twenty seated figures looking to left and right, and in others there are studies of the human figure and attitudes.

THE committee in charge of the Photographic Exhibition to be held at the Imperial Institute during the present year is making special efforts to introduce an historical element into the collection. Section A of the show will be devoted to illustrations of the results of the early processes, and Section B will contain works denoting progressive developments. These departments would, it is believed, be materially strengthened and made more complete by a loan collection of specimens of photographic art from its earliest pioneers, and from others who have made the art-science a study through the successive stages of its development. All interested in photography are invited to take an active part in the proposed display. The Council of the Imperial Institute, in their desire to further the scheme, have provided for this historical collection well-lighted space in the building.

OF late years (says a writer in *Blackwood's Magazine*) the most vital art movement in Scotland has been in the West. Although the coterie of painters known as the "Glasgow School" does not include all the artistic talent in that city, the name, in virtue of combination and unity of purpose among the members, and because they have so often exhibited together, has become a convenient descriptive term. The influences which have called it into being are complex; but the most powerful are undoubtedly Whistler's art (which blends the great traditions of the past and the wonderful decorative arts of the Far East) and the training several Glasgow men received in Paris, though from the pictures alone it is impossible to say who these have been. Desire for form as the basis of art, appreciation of the value of true tone and of the charm of decorative effect, increased regard for unity of effect—these are directions in which the new impulses have made themselves felt, and they are such as make for the purely artistic motive and the pictorial expression of thought. Some of these are not exactly characteristic of Scottish art as a whole; and it is not strange that, in trying to profit by the discoveries of French art, they should have adapted—not adopted—French methods to their ends.

THE list of the members of the Academy who are to winnow what will be sent to Burlington House, and make the ultimate choice of what shall be hung, is always a subject of interest at this time of year with the outsiders. So much so that it is said you can foretell what kind of an Academy it will be when you read that list in March. Of course some particular section of art is sure to be depressed, and this year it is the landscape painters. Here are the five R.A.'s who will judge: Messrs. Wells, Sant, Yeames, Orchardson, and Prinsep. Two out of the five portrait painters, and not a solitary landscape painter amongst them. It looks ominous. The young men, the new school, whose teaching is French, and whose sympathies are impressionist, they, one and all are peculiarly disconsolate. They give the most gloomy outlines of the kind of landscape which Messrs. Wells, Sant, Yeames, and Prinsep are likely to approve. Probably matters will not turn out at all so badly.

DUMFRIES is to have a new Academy, which is to be erected from the designs of Mr. Frank Carruthers, architect, of Dumfries and Lockerbie. We have seen a photograph of the architect's drawing, and from this we learn that the style will be pure Classic. The principal façade will have a Greek portico, surmounted by a domed tower, and will give access to the science and art class rooms. This portico will consist of four Ionic columns, 30 feet in height, and 3½ feet in diameter, supporting a covered tympanum,

the whole being surmounted by a stone dome. In addition to the requirements of a higher class school, the new buildings will provide for a science and art department for technical teaching, and for a gymnasium, the entire cost being £13,000.

At the sessional gathering of the United Club a discussion was initiated by Mr. Wrightson, M.P., on "State-aided Purchase of Working-men's Dwellings." He said that the measure which he had introduced to the House of Commons was one which, he believed, would be of the greatest service to the community at large. The only way to help the working man, in his opinion, would be by favourable loans from municipalities or from the State at such a rate of interest as would not tend to the prejudice of those lending the money. He claimed that this principle was essentially a Conservative principle, nor could he see any reason why it should not be appreciable to the English artisan as well as to the Irish or Scotch artisan. He believed that there was a genuine desire on the part of the English artisan to become the owner of his own dwelling, and it should be the duty of the State, or of the local authority acting through the State, to advance the money to enable the purchase to be made. The hon. member went on to explain the advantage which would accrue under his scheme to the working man, who, he said, taking his present rent at about £14 a year, would save at the least £6 annually, to say nothing of the fact that at the end of thirty years he would become the owner of his own house. Then, again, the working man, by this scheme, made provision for his old age; he became a more substantial member of the community. Such a measure would do more to put an end to the Socialistic nonsense talked in the present day than any legislation could do.

BEFORE the Select Committee of the House of Commons, presided over by Mr. Roby, Mr. Balfour Browne, Q.C., the leading counsel for the Great Northern Railway Company's omnibus bill, which seeks among other things to acquire property for making a new goods station at Manchester, said he was glad to say that, since the adjournment from the previous day, the Company had come to an arrangement with the Manchester School Board. At present the matter was in an inchoate state, but the substance of the bargain was that the Company agreed to purchase the School Board premises for a lump sum of £50,000. They also agreed—and this was generosity—to give them the costs of the opposition.

WORKMEN engaged in the demolition of China Lane, Lancaster, one of the oldest streets in the town, formerly the principal road from south to north, have made several interesting "finds." A quantity of copper coins, dating as far back as 1644, together with others of 1734, and those in vogue during the reign of George III. and George IV., have been discovered in the cellar excavations, and also under many of the floors. A couple of wells—one 30 feet deep—have been opened up, in one of which there is four feet of good water. Attached to it is a suction pipe, which had evidently at one time been used for bringing the water into a kitchen. Some enormous stones have also been unearthed, including one or two eight feet long by five feet wide, which have evidently been used as coverings for vaults. In the street, are some old-time houses, once the abode of the West India merchant princes of the town, and at the end is a building that contains the shield and arms of the Earl of Derby. It is proposed to place the coins and other antiquarian relics in the museum in the Lancaster Storey Institute.

THE development of traffic on the Manchester Ship Canal, and its increasing importance as an agent of trade, give interest to a smaller but similar project in the adjoining county. Sheffield, like Manchester, has been eagerly seeking an adequate waterway to the sea, and now, through the enterprise of South Yorkshire capitalists and the assistance of the Manchester, Sheffield, and Lincolnshire Railway Company, she will probably get it. No English city has been so crippled in its trade by heavy railway rates. Some years ago one firm removed the whole of their steel rail-making plant to Workington, and still manufacture on the seaboard to escape the cost of land transit. The Sheffield market for ship plates has also dwindled because of the difficulty of competing with makers nearer the coast. The city maintains its reputation for the production of armour plates, but the carriage rates and charges for this bulky and heavy material are enormous. Considerable ingenuity is, moreover, required safely to convey these huge plates to port. Only two years since, the up and down lines of one of the railways running from Sheffield to Hull were entirely cleared of traffic on the Sunday so that a portion of the armour and the anchor of a Russian man-of-war might be sent through for shipment. The inconvenience, expense, and trouble of reloading will be avoided by carriage along the canal, or rather, series of canals, which the Sheffield and South Yorkshire Navigation Company have bought and

SKETCH OF STABLES: BY BANISTER FLETCHER.

intend to prepare for systematic traffic from Sheffield to Goole. It is doubtful whether the North German Lloyd steamers will ever penetrate to the canal basin, near the Sheffield Corn Exchange; but though the South Yorkshire waterway will probably never bear such large ships as may be seen at the Salford quays, or passing through the Eastham locks, a great expansion of business is anticipated.

THE canal stretches from Sheffield to Tinsley, there joins the River Don Navigation, and runs through Rotherham, Mexborough, and Doncaster. At Stainforth it merges into the Keadby Canal, and a lock opens the way to the River Trent. By the Dove and Dearne Canal communication is possible with Barnsley, and it is also intended, by the construction of a new canal from Brainwith lock to Sykehouse Bridge, to enter the Aire and Calder Canal. The company will have nearly sixty miles of waterway under its control, and though it only styles itself a barge canal undertaking, it proposes to make a big lock and basin at Keadby for the admission of vessels as well as barges, and may ultimately deepen and widen the canal or canals, to allow the passage of boats of light draught into the basin in the heart of Sheffield. Meanwhile the various navigations have been formally handed over to the company, and directors appointed to do all in their power to improve the waterway and foster trade on it.

UNKEMPT would seem to be a legitimate criticism of the condition of Westminster Abbey Churchyard, more particularly that part of the ground which is situated between the east end of the building and the passage or street leading to Poets' Corner. There appears to be not a single blade of living grass, it is dead and drab, and a *Times* correspondent saw, the other day, in this small space quantities of paper of all description and colour, orange peel, straw, fibre from matting, dead leaves, glass and stone bottles, four matchboxes, several omnibus or tram tickets, four old milk or meat tins, a wooden bat, two pieces of linoleum, a large coil of iron, a red rag, and other unsavory rubbish, while in the niche of the venerable buttress nearest to the entrance in Poets' Corner was a large heap of pieces of paper intermingled with feathers and pots! This is a serious indictment. Surely Poets' Corner even *externally* should be sacred.

PROFESSOR CHURCH has reported to the First Commissioner of Works on the condition of the frescoes in the Palace of Westminster. His operations have been confined to cleansing the frescoes and to some slight treatment of defects, and he will further report after a time how the paintings have been affected by the processes he has employed. The deterioration of the paintings in the Royal Gallery is attributed to the frequent deposition of moisture on their surface which carries suspended soot, dirt, and dissolved sulphuric acid. In the Peers' Robing Room the surface of the picture of "Daniel" has been washed with distilled water, and the surface gone over with cotton-wool moistened with pale drying linseed oil, free from lead. The result has been a decided improvement in colours and general effect. The report is fairly hopeful, but the examination was urgently needed. The maintenance of a uniform temperature is recommended. The frescoes in the Upper Waiting Hall are in a deplorable condition, and there is not enough left of them to admit of their being restored.

MR. DARLING, M.P., has introduced a Bill into the House of Commons for the separation of St. Paul's, Deptford, from the Greenwich Board of Works. This is a proposal which would decidedly improve local government in the district. The large parish of St. Paul's, Deptford, with its population of over 90,000, has never been able to work smoothly with the parish of Greenwich, which has a population of about 40,000. The two districts differ in character and sentiment. But Greenwich is jealous of Deptford, and its member, Mr. Boord, has blocked the Bill. The small Vestry of St. Nicholas, which represents only 4,000 people, has joined, with the result that Deptford Vestry has become discouraged and has withdrawn the proposal. St. Paul's, Deptford, however, which has a population of about double the two districts from which it desires to separate, will lose this opportunity of enjoying local government. The only chance for the district now is to return a sufficient number of members to the Board of Works who would be in favour of the separation; but this is a process which will take some years to accomplish.

THE Corporation of the City of London have sanctioned an expenditure of £41,500, for the construction of cooling and chilling chambers at the Foreign Cattle Market at Deptford.

THE plans of the new Town Hall, Rotherhithe, have been on view for six days in the public library, and the exhibition was visited by 2,200 persons. The new mortuary is to be commenced immediately, and application has been made to the St. Olave's Guardians for the temporary use of the mortuary at the infirmary during the demolition of the existing and building of the new one.

The Builders' Journal COMPETITIONS.

FIRST ASSESSOR.

We have pleasure in announcing that

MR. ASTON WEBB, F.R.I.B.A.,

has kindly consented to act as Assessor to the first of our series of competitions. Mr. Webb has stipulated that the whole of the drawings should be submitted to him, as he holds that "it cannot be satisfactory either to an assessor or the competitors for him to place a design *First* when he has not seen all the drawings."

The whole of the competitive designs will, therefore, be laid before Mr. Aston Webb, and his award will be published in these columns in due course.

For the benefit of those Architectural Students who may not have seen our previous announcement, we repeat the substance of it, making an alteration in the form of application for our own convenience.

The proprietors of THE BUILDERS' JOURNAL will advertise each month for Competitive Drawings from students and others under 25 years of age, and will advertise the details of the competitions.

Intending Competitors must send their names and addresses on a post-card, to the Editor, announcing their intention of competing. The drawings must be delivered under *Nom de plume* to the Editor, who will submit them to an independent assessor in the person of some well known practising architect, who will make his award. Certificates, signed by the assessor, will be presented to the authors of the three premiated designs and a cheque for half-a-guinea forwarded to them to defray their out of pocket expenses. At the end of the session the thirty-six premiated designs will again be submitted to a body of experts—preferably a committee formed from the twelve monthly assessors—and upon their report a valuable

Gold Medal and a Cheque for £10 10s.

will be presented to the fortunate student who has, in their opinion, done the best aggregate work. The author of the best set of drawings submitted in any single competition will be awarded a Silver Medal and a Cheque for £3 3s. A public exhibition of the premiated designs will be held. The result of the monthly awards will be announced in our columns and the assessors' reports will be published in full. The drawings will remain the property of their authors, but we shall reserve the right to publish any we think fit.

The Second Competition.

The Proprietors of the BUILDERS' JOURNAL invite drawings, in competition, from those under twenty-five years of age, for a Village Club House, on a corner site, 150 feet by 40 feet. The Club to contain a general room with a dais for the villagers, a reading room and library, a bowling alley, service bar, tea room, committee room, housekeeper's apartments, and three cubicles for public use. The necessary outbuildings must be provided. Cost not to exceed £2,000. Drawings to be delivered at Talbot House, Arundel Street, Strand, not later than Monday, the 29th April, 1895.

MUNICIPAL electric lighting in Brighton has been very successful. The income on last year's working was £16,374, which, after deducting working expenses, and £5,000 for interest and repayment of loans, showed a net profit of over £5,000.

The Builders' Journal.

MEN WHO BUILD.

No. 7.

PROFESSOR BANISTER FLETCHER,
J.P., D.L.

If you were asked—invidiously—to point out that all-round man, who being thoroughly conversant with the modern

practice of architecture, had yet a pretty turn for the fitness of things in design, who knew a thing or two about those perplexing "light and air" subjects, and those heart-breaking "party structures," who could write a voluminous book upon the London Building Acts, and yet foster a soul-inspiring adoration for delicious carvings, who has thrashed out the details of model houses for the industrial classes, who "chairs" the Sanitary Committee of the City of London, and can deliver a delightful lecture on the intricacies of modern plumbing, or ancient Greek art, there is no one you could name but Professor Banister Fletcher, who, amongst a hundred other duties, has again accepted the presidency of the International Building Trades' Exhibition now open in London.

There are men, even in architecture, who thrive on hard work, who delight to get to their desks before the office boy has condescended to dust it, and to remain at it long after the toilers of the busy world have departed for the night. Banister Fletcher was reared under such conditions.

He had the audacity to begin practice when he was twenty, and, as if to prove the value of audacity, Fate has never taken the trouble to punish him for it. Charles James

Richardson, a writer of architectural books, which have survived his architectural reputation, was Fletcher's first master, and he induced his pupil before he settled down to the drawing board, to master all the details of plumbing, carpentering, painting, and general practical building work. He can, therefore, to this day dress a door and wedge up mortices—one of the most difficult simplicities of joinery—build up a brick wall, and wipe a plumber's joint, and he may take it as unction to his name that there are not six other architects in England who can rival him. Upon this part of an architect's training, the Professor feels strongly, and is convinced that the more one studies these theoretical matters during his ordinary

training, the better able will he be to cope with the extraordinary difficulties which arise in general work; difficulties which overwhelm one unless they can be met by

[Gratis.]

NOTICE.

Up to the evening of Saturday, the stands of most of the exhibitors at the Building Trades' Exhibition were in a state of chaos, and quite unfit to be dealt with by an independent and conscientious critic. We do not intend to criticise or notice goods before we are able to personally examine them, and therefore, although at a great pecuniary loss to ourselves, we determine to issue a supplement dealing with the few completed exhibits in the present issue, and to continue our survey over a

SECOND SUPPLEMENT,

which will be included in our second Exhibition Number, of Tuesday, 2nd April; also bearing a first edition of

25,000 Copies.

Advertisers who have placed supplemental contracts with us which do not appear in this number will have their announcements in that issue, and exhibitors who have not yet supplied us with technical details of their goods on show, are requested to send them to us at Talbot House, Arundel Street, Strand; or to our office in the Exhibition, STAND 81 C.

Telephone 35,422.

OUR SURVEY.

A MID the shouts of railway carmen, the chattering of workmen, the rattling of pulley blocks and chains, the clinking of the bricklayers' trowel, and the thunderings of a hundred carpenters busily at work, the "International" Building Trades' Exhibition of 1895 bids fair to be the very best of the series hitherto held, and to possess many novel exhibits of an interesting character. The mere novelty in building materials is a thing to be severely avoided, and we shall have to notice many avoidable manufactures before we are finished. What perhaps is the most striking feature of the Exhibition is the wonderful advance potters, tile workers, and sanitary specialists seem to be making hourly in their manufactures. Unfortunately, at the latest moment these lines could be written, not a single clay worker had his stall completed, and as this section—perhaps out of compliment to the organiser of the Exhibition, Mr. Greville Montgomery, the well-known Proprietor of the *British Clay Worker*—is the most interesting of any in

the Hall, we shall have to defer a detailed survey of these exhibits until next week.

Messrs. Duckett & Son, of Burnley, Messrs. Stanley Bros., of Nuneaton, and Messrs. Gibbs, of Loughborough,

were the most advanced, and we might almost deal with their stalls here, but it would be better, in the face of the keen competition existing between producers of brick, tile, and earthenware goods, to deal with the section as a whole a little later. Visitors, however, will not fail to give very careful attention to Messrs. Duckett's exhibits, particularly good in latrine manufactures, or to the remarkably fine glazed bricks of Messrs. Stanley Bros.

The Albion Clay Company,

who occupy a fine position in the central portion of the Exhibition, were almost in a state of completion when our report left. Some of the most perfect drain pipes at present in use in England are the Paragon pipes, made by the Albion Clay Company. The chief feature of these pipes is that it is

"The Marriage of Ingenuity and Simplicity."

KAYE'S PATENT WEDGE LOCKS

— AND —

KAYE'S PATENT SAFETY CATCHES

**Are acknowledged to be the Finest and Most Ingenious Specimens of Lockmaking in existence.
A Perfect Revolution in the Locksmith's art.**

KAYE & SONS make Patent Locks, Bolts, Latches, and Handles for every kind of Door, Desk, Drawer, Fanlight, Window, Cupboard, &c., including Railway Carriage and Brougham Locks, Cart and Railway Wagon Doors, all of which have great advantages over all others. Also Patent Exit Fittings for doors that open outwards and for doors that open both ways, which were invented to meet the wants of the London County Council.

Prices and Particulars on application to

JOSEPH KAYE & SONS, Ltd.,

93, High Holborn, London, W.C.; & Kaye's Patent Lock Works, Hunslet, Leeds.

impossible, either by imperfect laying or subsequent ramming down of trenches, to possess a faulty invert. The inner core of the rim or socket is made eccentric to the barrel of the pipe itself by thickening the bottom section so that the next pipe inserted possesses a true barrel with its preceding fellow without any packing underneath being necessary to raise it into position. This naturally prevents the one great defect of imperfect drainage there being a perfect bore in the Paragon; from end to end of a drain, allowing no accumulations of sewage matter at the joints, and permitting the flushings to perform their proper duty, and thoroughly cleanse the system. The "granitic stonewares" from which these pipes, and indeed, all the manufactures of the Albion Clay Company are made, is remarkably hard and of a fine appearance. The clays appear to be blended to insure, so Mr. Knowles tells us, a dense, impervious and imperishable body, and have been tested by Kircaldy to the highest possible crushing and bursting pressures. This firm makes, and has on show, all the sanitary

Inventions of Mr. Sykes,

who will be remembered as having once held a high official position in the engineering interest of Fulham. Mr. Sykes' Sewer-Gas Interceptor, which will be found thoroughly explained and illustrated on pages 4 and 5 of the supplement, contains many striking improvements of every interceptor previously known. We understand that the price has been brought down to successfully compete with the cheap and oftentimes imperfect interceptors which foolish people will still insist upon using. The Patent Channel Bends for Inspection Chambers, invented by Messrs. Jones & Sykes, to prevent the terrible dangers of "splashing," which in Sanitary Science is recognised as one of the first things to be avoided, are

shown in position on the stand, and are also detailed and explained fully on page 5. The Albion Clay Company are known to possess the finest clay "fields" in the South of England. They have magnificent works near Burton, with machinery able to turn out the largest pipes and pieces of clay-ware to be found in the market, and the quality of these goods is beyond reproach.

Messrs. John Line & Son,

of Reading and London, have an "artistic" pavilion in which to show their Wall Papers. They have several excellent designs by A. Silver, Owen Davis, "Jonquet" and A. Wilcock, well worth inspection. This firm appears to be agents for many decorative materials, Stained Glass, "Alabastine" and "Duresco," Petrifying Liquids, Varnishes and the like.

One of the least pretentious stands in the whole Exhibition, is that occupied by

Joseph Kaye & Sons, Ltd.,

demonstrating the uses of their remarkable series of locks which are no longer entirely of the "push and pull" principle. We have previously referred to the K's locks in the columns of this journal, but the more we see of them, the more the simplicity and ingenuity of the marvellous little bits of mechanism are explained to us, the more we wonder that they are not in absolute universal use. It is remarkable how difficult it is to upset any fossilized system connected with such ancient pieces of mechanism as locks, but our surmises are utterly wrong if the Kaye system does not eventually wipe the old imperfect method off the earth. One need go no farther than the Kaye railway lock, nearly 30,000 of which are in use on the Great Northern, and which is to be placed on the carriages of the London and South-

Western, and several other metropolitan companies. A working model is on view, also one of the brougham locks, which are as simple and as perfect as it is possible to make them. Cupboard locks innumerable are shown of the most approved action, and the lock used for folding doors has something quite uncanny in its remarkable simplicity. The "Panic" fastening is the most perfectly adjusted fastening we have seen, and a simple little catch for fastening the tail boards of dog-carts or builders' heavy carts caused us to laugh in absolute wonder at its ridiculous simplicity. Who does not know the linchpin method of fastening every tailboard and horse-box and cattle truck from Cairo to Chicago? Mr. Kaye, like the other millions of inventors, saw the same thing, but he went home and altered the whole senseless system in a moment. A simple turn of the forefinger will open his tailboard fastening, even in face of a pressure of twenty tons, and yet the twenty tons multiplied by twenty could not force the bolt otherwise than by smashing it to pieces. The man who knows not Kaye's locks is to be pitied; he that knows and does not use them is to be pitied more. They are the most perfectly devised fastenings we have ever seen.

The stand of the

Self-Lock Roofing Tile Company,

of whose goods we know very little, was a mere mass of quartering towering above anything else in the Hall, but which seems worthy of some critical attention. At the moment, we are not altogether pleased with the angular presentation of these tiles, and we should imagine that unless something remarkable in the way of price, or in the manner of fixing is found in this system, that the Company will have a task to make their goods acceptable to architects.

REVOLUTION

IN THE MANUFACTURE OF

Glazed Bricks, Tiles and Wall Decorations.

The Old Glaze superseded by a Superior and Cheaper Article.

THE new Patent Material known as "**OPALITE**" is manufactured from the finest Opal and is prepared in most colours and tints, for Plain and Fancy Wall Decorations.

The beautiful artistic effect produced by the application and manipulation of "**OPALITE**" to the Walls of Public Buildings, Hotels, Restaurants, Banks, Offices, Corridors, Staircases, Private and Public Houses, Baths, Lavatories, &c., is of a practical and high class character, as the "**OPALITE**" does not craze nor wear out like ordinary glaze, and therefore needs no renewing.

The combination of colours and tints, when fixed on the wall, blend and sparkle in a most brilliant and pleasing manner, and produce an effect hitherto unattained with any other Wall Decoration.

Orders can now be promptly executed, and Architects' designs carried out with scrupulous care and despatch by competent Assistants.

OFFICES AND SHOW ROOMS:

The National Opalite Glazed Brick & Tile Syndicate, Limited,
142, CHARING CROSS ROAD (near Oxford St.), LONDON, W.,

AND

26, PALL MALL, MANCHESTER.

Telegraphic Address:—"OPALITE, LONDON."

One of the very few striking novelties in the Exhibition is shown at Stand 172, an exhibit which does not, in our opinion, show the novelty to the best advantage, and which is lacking in a judicious selection of colouring, which would greatly have enhanced a method of glazing which has very many things to recommend it. The National

Opalite and Glazed Brick and Tile Syndicate, Limited,

of 142, Charing Cross road, and Manchester, are the makers of a new material which they call "Opalite," and which they say is manufactured from the finest opal. The material is made in very thin tablets of any size and of any colour, and as it possesses a surface of remarkable brilliancy it offers itself to a wide use in every way glazed bricks or tiles are adapted. It can either be attached to bricks by means of a compound cement specially made for the purpose by the Company, or an ordinary wall can be covered with it in the same way as tiles would be used, with the difference that it adds but the slightest extra weight to such a wall; it occupies in thickness but the fractional part of an inch, and it shows a brick joint. Where borrowed light is a necessity it appears to us that Opalite would answer much better than any glazed brick or tile at present in use. In price it is cheaper than tiling, and it should undoubtedly have a large field of usefulness in lining corridors, bath rooms, dairies, larders, lavatories and kindred domestic offices, bakehouses, cafés and confectioners shops. And there are thousands of wretched areas and back elevations in the City of London alone that would be greatly improved by an early and intimate relationship with the new material. It stands intense heat, intense cold, and extremely rough usage, and it can be made in any tint from pure and inoffensive white to the most alarming colours it is possible to imagine.

One of the greatest novelties in the Exhibition is

Pease's Tubular Construction,

shown by Messrs. Ashmore, Benson, Pease & Co., Ltd., manufacturers, Stockton-on-Tees. In this system sheets of metal of almost any size and reasonable thickness, are rolled into tubes, and without the longitudinal joint being completed, are interlocked with other tubes and the interstices filled with concrete, which, when perfectly hard, forms a most remarkable combination of metal and concrete, possessing great compactness and strength. The Patentee was good enough to show us the various uses to which his system may be put.

He can manufacture a thin partition wall of only two inches in thickness, which will with-

stand four times the pressure of any partition

constructed of any ordinary materials. He can provide air spaces through that partition. It shall be fireproof and comparatively sound proof, and it is as cheap. The columns exhibited in the stall are quite pleasing to the eye, and cross sections of them show but a series of pretty circles interlaced one in the other. Columns may be tapered and when filled in solid with concrete will bear enormous weights. Tubular Flooring is also easy of construction, and should be remarkably cheap.

In a pretty little hut near the Band Stand the

Granite Silicon Plaster Company

show the Granite Plaster in the various phases of its usefulness; it is applied in different panels on the ordinary lathing, and several of the many new and piping hot metallic inventions which supersede the poor old lath. There is the honest wire-netting and the idiotically termed Jhilmill, a term more adapted for the name of some quack corn-lover than a serious building material, made by such a firm as Heywood Bros. & Eckstein. However, we were notified of this exhibit, and our representative gave special attention while the plasterers were at work, and we are of the firm opinion that what the proprietors claim for this substitute for lime and hair plaster is perfectly just and warranted. Within twenty-four hours of the application of Granite Plaster "it becomes dry, hard, dense and metallic, with great elasticity." All this is proved to our satisfaction with the exception of the elasticity of the material, and that we have had no power of testing; but we shall do so, and if we find that it has elasticity, as we have no doubt it may have, then one of the greatest objections to the ordinary "plaster" is removed. The proprietors claim also that it will bear rough treatment without denting, chipping or

GRANITE PLASTER

You can render and float in one coat and set same day.

You can paint or paper within a few days from finishing.

It is intended to displace ordinary lime plaster, and the price has been brought down so as to give to the Trade a first-class material, with all its advantages, at about the same cost.

WE CLAIM, BRIEFLY, THE FOLLOWING ADVANTAGES:—

- It is fireproof, and a perfect non-conductor.**
- It presents, when finished, a smooth surface as hard as stone.**
- It is extremely simple to prepare and easy to apply.**
- It is the best thing for quick repairs.**
- It has no rival positively as a structural material.**

Our Pamphlet, containing all particulars, will be sent free on application to the

Chicago Exhibition.Highest Awards.

ALBION CLAY COMPANY, Limited,

SOLE MANUFACTURERS of the  "GRANITIC STONEWARE" Pipes.

TRADE MARK.

All the "**Granitic Stoneware**" Pipes are made from "**Stoneware**" Clays, of which we are the Sole Proprietors. The Clays are carefully selected and blended to insure a hard, dense, **impervious and imperishable** body, specially adapted for **Sanitary** Purposes. The Pipes have a "**toughness**" as opposed to "**brittleness**," which is not possessed by any other Stoneware Pipes. They have been proved to withstand the highest crushing and bursting pressures under tests by Kirkaldy and other authorities at home and abroad. They are made by the most improved Patent Machinery and are highly approved for their uniform superior quality. All the Pipes are stamped with the Trade Mark, "**Granitic Stoneware**," as above.

TESTED PIPES.—Selected and Tested under Hydraulic Pressure and Marked.

All Sizes from 6 in. to 24 in. diameter of full Standard thickness and of any length up to 3 ft. for 6 in. and upwards.

PATENT PARAGON PIPES.

PATENT PARAGON PIPE. C FORM.

PERSPECTIVE VIEW

LONGITUDINAL SECTION THROUGH C.D.

SECTION THROUGH
A.B.

Sound Portland Cement Joints to stand any test. True alignment of the Invert and Firm Rest. No obstructive ledges at Invert as with ordinary Socket Pipes. Free Flow. No Stoppage. Full Capacity of Sewers and Drains maintained.

CHEAPEST IN FIRST COST AND MAINTENANCE.

The **Patent Paragon Pipes** are superseding the **Ordinary Socket Pipes**. They are being specified for important Sewerage and Drainage Work in all parts for Government, Corporations and Sanitary Authorities. They have been used for the new Drainage of Smedley's Hydropathic Establishment, Matlock, Derbyshire, and the Royal Opera House, Covent Garden, London, &c.

To meet the requirements of **Sewerage** and **Drainage** according to circumstances the **Patent Paragon Pipes** are made in three forms:—(A) With ordinary depth of Socket for Surface Water Drains, &c. (B) With **deep** Sockets for **Sewers** and **House Drainage** and (C) With **extra deep** Sockets for the Best Class of Work.

When **specifying** the Name should always be given in full as **Patent Paragon Pipes A, B, C**, according to the kind required.

SYKES' PATENT JOINT PIPES.

THE MOST RELIABLE
PIPES FOR MAIN SEWERS
IN WATER-LOGGED
GROUND.

WATERTIGHT JOINTS
MADE WITH THESE
PIPES WHEN ENTIRELY
SUBMERGED.

The Screw Joint ensures true alignment of the Pipes. The **Patent Jointing Material** is **impervious** and **imperishable**. It sets slowly and yields for a time to any settlement of the Pipes in bad ground. It cannot enter the Pipes and cause obstruction therein, as in grouting. Sykes' Patent Joint Pipes have made watertight Joints in water-logged ground where other Patent Joints have failed. Easily laid by Ordinary Pipe layers. Bends and Junctions easily inserted.

Moderate in Cost, Easy to Lay, and the most Reliable of any for Bad Waterlogged Ground.

SYKES' PATENT SEWER GAS INTERCEPTOR. The most **EFFECTIVE** for the **PRESERVATION** of **HEALTH**.

JONES & SYKES' PATENT CHANNEL BENDS FOR **MANHOLES** AND **INSPECTION CHAMBERS**.

SANKEY'S PATENT DEEP INTERCEPTING GULLY, with Galvanised Bucket.

KEITH'S PATENT DRAIN TESTING AND FLUSHING APPLIANCES.

SYPHONS, GULLIES, INTERCEPTORS, &c., with **PATENT PARAGON SOCKETS**, to avoid check to flush in forcing Solids through the Trap.

INVERT, JUNCTION, AND GULLY BLOCKS. **STREET GULLIES** to any Size. **LATRINES, CLOSETS, SINKS, &c.**

PLAN

NOTE.—The Interceptor can be obtained without the inlets A or B, or with one or both of them.

IMPROVEMENTS.

Prevents the admission of sewer gas to house drain.
Provision for ventilating Public Sewers (which may or may not be used).
Pressure of gas on the sewer side being taken off by the Ventilator, the water seal cannot be forced.
The Interceptor being sealed prevents the escape of gas into the Chamber.
Provision for the admission of fresh air to the house drains.

The Patent Screw Stoppers in inspection inlets cannot be forced out, but can be removed at convenience for cleansing the sewer or drain if required, and for testing the drains.

By confining the sewage to the Interceptor it cannot escape to permeate the sub-soil or brickwork of the manhole.

The concentration of all parts in the Chamber, where they are easily accessible, gives full control over the System.

JONES & SYKES' PATENT CHANNEL BENDS.

FOR INSPECTION CHAMBERS.

These Improved Bends have been designed to prevent the splashing which at present occurs in the Chambers, and also to better direct the course of the sewage to the Main Channel. Sewage discharged through imperfect channels is deposited on the benchings and walls of the Chamber, where it decomposes and generates foul gases. The Improved Bends are bridged across the outlet half, and slightly curved over from the top, which forces the sewage downwards and prevents splashing.

The outer wall is also curved towards the inner wall of the outlet, thus discharging the sewage in the direction of the main channel, and the slight ledge extending in an inclined direction at the outlet end of the bend, breaks the force of the sewage and directs it towards the outlet of the main channel. A portion next the collar or socket is also bridged over and cut off at an angle, so as to conform better with the brickwork of the chamber, thus avoiding all cutting and unsightly rendering with cement.

cracking; that its tenacity and adhesive power constitute support to walls and partitions, and that it presents a smooth surface when finished as hard as stone. Habitual users of the old lime and hair will be glad to hear that the price of Granite Plaster has been brought down to compete favourably with it. The address of the Company is 36, King's Road, St. Pancras.

The Simplex Window Fittings Company

have challenged our opinion upon their well-known system of sashing and framing, whereby all difficulty of cleaning is removed. We can but form one opinion from the model they forwarded for our inspection, and from the actual exhibit in the Agricultural Hall, that it is far ahead of any other contrivance of the kind and remarkably good at that. We always hold a little consultative council of our own over all models or specimens submitted to us for inspection, and each member of the staff critically surveys the exhibit and writes down what he considers are its virtues and its faults. It was discovered that whilst the Simplex had many good points, it had only one trifling defect, counteracted undoubtedly by the ease with which the windows are manipulated. At our offices and in our own house there are many casement windows opening outwards and the only possible (leaving the judicious out of the question) way to clean them is from ladders raised from the ground. What can the Simplex Window Fittings Company do for these.

A near neighbour is

W. E. Rendle & Co.,

who exhibit a modest model of their Invincible Glazing. We watched the workmen fix this up, cut the metal-work, attach it to the rafters, and glaze the roof, and since, we

have been wondering what the putty-makers will do presently. The system appears to us to be perfect.

We should like to have said something in this issue about

Messrs. Candy's

goods, but at present they do not exist. We must wait patiently for the completion of their exhibit, as also that of the

Expanded Metal Company, Ltd.,

which occupies the central pavilion, upon which a very heavy rent is paid. The operations at this stall have had the supervision of Mr. John French Golding—of Chicago—the beneficent gentleman who makes things hum over this side, and who has, up to date, consumed more cigars and made more dollars out of one of the most delightfully simple inventions it has ever been our lot to investigate, than any other man within a few miles of the Agricultural Hall. As this Stand is near our own Office, we have exercised a little curiosity to discover what all the coming and going and bustle means, but at 7 p.m. Saturday night, we are as far off the track as ever. Until our survey is completed, however, visitors will have no difficulty to become thoroughly interested in this exhibit, the proprietors of which have recently bought up the business of the British Metal Expansion Company, Ltd. We shall be much mistaken if "Expanded Metal," in all its applications, does not "lick" creation. But we are going to test it thoroughly before we finally pass such an opinion.

The Kauri Timber Company

have a modest little show of some beautiful New Zealand woods, and truly, it is difficult to obtain even pine so free from imperfections as the produce of this Company. They

appear to have no less than half-a-million acres of forest land, containing over two thousand million feet of standing timber, mostly of the Kauri (Dammara, Australia) species which—says their circular—is the monarch of New Zealand forests, and is recognised for general purposes as the most valuable timber in the world. For all purposes where pine is generally used in joinery, the Kauri can hold its own with anything. Its transverse and tensile strength may be gathered from the tables of comparison made by H. M.'s Timber Inspector to the Admiralty:—

TRANSVERSE STRENGTH
(Scantling, 2in. by 2in. by 8 1/4in.).

	Relative strength.	Breaking weight in lbs. per square inch.
Pitch Pine	1'109	262
Danzic Fir	1'087	219
KAURI.....	'892	204
Canada Spruce.....	'831	168
Canada Red Pine	'810	163
Russian Larch	'776	157
Riga Fir	'744	150
Canada Yellow Pine ...	'665	134

TENSILE STRENGTH
(Scantling, 2in. by 2in. by 3oin.).

	Relative strength.	Breaking weight in lbs. per square inch.
Pitch Pine	'616	4,666
KAURI.....	'600	4,543
Russian Larch	'555	4,203
Riga Fir	'535	4,051
Canada Spruce.....	'520	3,934
Danzic Fir	'427	3,231
Canada Red Pine	'357	2,705
Canada Yellow Pine ...	'267	2,027

"It will be seen from the above," says the Inspector, "that Kauri is only excelled in transverse strength by the American pitch pine and Danzic fir—the former a timber not

suitable for general building purposes; while the superiority of the Danzic fir is very slight, and it is decidedly inferior in tensile strength as well as in durability when exposed." It will, therefore, be seen that Kauri pine is specially adapted for wood pavement, and for that purpose alone an enormous future is in front of it.

A fine collection of ornamental wrought-iron gates and standards, railings, and fence-

ful survey of the exhibits, it strikes us that the prices are extremely low. For instance, a pair of gates entirely of wrought iron, and very commendable in design, 8 feet wide by 5 feet high, is, with best brass warded lock, sham, and hangings for stone piers, catalogued as low as £11, and on the cover of the said catalogue we notice the fascinating little sentence of "liberal trade discounts," so that Messrs. Hayward & Sons encourage a large business. Their goods will bear a very careful inspection.

ARCHITECTS AND THE BUILDING EXHIBITION.

A LITTLE DINNER AT THE CAFE ROYAL.

IF it be a good thing to have judges in a good humour, craft competitors at the Building Exhibition should not have much to fear. There was a little dinner of delicacy and reason at the Café Royal, on Saturday night, Professor Banister Fletcher being the host, and some thirty architects, members of the R.I.B.A., guests. A few associated with the Exhibition in an official capacity were included. The Café Royal lived up to its reputation, and so did several of the speakers, indeed, the after dinner oratory was of an inspiring order. The success of the Exhibition seemed to be in the air, and such comfortable cordiality gave the show a "send-off." Professor Banister Fletcher's little speech was bright

and interesting, and Mr. Greville Montgomery's "health," as the guest of the evening and the organiser of the Exhibition, was an important matter. Replying, Mr. Montgomery indicated that a sterling Exhibition had been his aim; he felt gratified by its industrial success; any financial gain had rightly, he thought, taken second place this year. Mr. T. Blashill, architect to the London County Council, proposed the Hon. Secretaries, and Messrs. Locke Worthington and H. P. Fletcher responded, the latter in an amusing speech on the duties of the Hon. Secs. Mr. Arnold Statham proposed the Judges, composed of twenty members of the Science Council R.I.B.A., and nominees of the different City companies. Mr. W. C. Street, Hon. Sec. to the Science Council, responded. Other toasts in which Messrs. Douglass Mathews, Searles-Wood, Ernest Benedict, and Prof. Unwin were implicated, closed the list. Messrs. Searles-Wood, Burrows, and Benedict sang songs. It was a pleasant little gathering. Next Monday (April 1st) the Judges will attend to adjudge the work of the competitions held the previous Saturday.

Our Survey will be extended to our Second Special Supplement of next week.

The Builders' Journal is published at 3 a.m. on Tuesday mornings, and should be obtained from any Newsagent in the Kingdom the same day.

instant decision, in which there is no element of doubt or uncertainty.

Himself a "Tyke," Banister Fletcher commenced work in Newcastle, but the magnetism of London drew him south, years ago. Amongst many works, illustrations of which embellish the walls of his delightful room in New Bridge Street, and overflow into the corridors and offices adjoining, are a score or more of suburban residences in Hampstead, Hendon, Clapham and Epsom; chapels at Wood Green, Bromley and elsewhere; the Jamaica and Circus cafés; factories at Clapham, Newington, Lower Thames Street, and Garlick Hill; schools at Finchley, model dwellings at Peckham and Pentonville, a gymnasium at Lambeth, residential flats and shops in Oxford Street, and the Headquarters of the Tower Hamlets Rifles. The Professor has also laid out large Metropolitan estates at Hanwell, Kennington, Hampstead and elsewhere. His practice as a consulting architect and surveyor is very extensive, and

Carpenters' Company has also established a branch of its Technical Reference and Lending Library at King's College, and during the past few years has been devoting itself to the furtherance of technical work connected with the noble science of carpentry, aided greatly by the earnest help of Banister Fletcher, who is chairman of its Educational Committee. Besides having done much to popularise architecture as a means of educating ordinary tastes to an appreciation and love for the beautiful, by his delivery of an enormous number of lectures at public institutions, Banister Fletcher has written various works which have become the standing authority upon the subjects he has treated. They comprise "Dilapidations," "Light and Air," "Valuations and Compensations," and "Arbitrations," and he is at present engaged upon what will unquestionably be his most important contribution to the text books of his profession. Last year he was president of the Engineering and Building Con-

the wood-carvers' art. Dotted all over his rooms are lovely little bits he has picked up in his wanderings of the past thirty years—little bits from Florence and Normandy, Athens and Newington Causeway; little bits of no nationality outside their own charm; little bits he has found in old City houses, and from which he has carefully "pickled" the accumulations of a century's paint-work.

In the Administrative Council of the Metropolis, Banister Fletcher occupies an enviable position. He possesses a good voice and a clear and happy delivery, making him an excellent chairman and an interesting host. His two sons, who are associated with him in his work, show signs of emulating the energy of their sire. Mr. Banister F. Fletcher, the elder, having been the A. A. medallist for design in 1888, the Arthur Cates Student in 1889, the winner of the Godwin Bursary in 1893, and a Medallist of Merit in the Tite Prize of the Institute

Oak Door in Billiard Room for His Honour Judge Hall Q.C.

as an arbitrator and umpire he speaks with recognised authority. It is five-and-thirty years ago since he was elected an Associate of the Institute, and sixteen years later when he assumed the honours of full Fellowship; he is also a Fellow of King's College. West Newington claims him as its district surveyor, and he is likewise one of the surveyors to the Board of Trade. Elected Professor of Architecture and Building Construction at King's College, Banister Fletcher, with much energy, carried out his idea that such an institution should possess, for the benefit of its architectural students, a reference museum, which was partly fitted up at his own expense. It contains a fine collection of casts, models, diagrams, drawings and photographs, to which additions are constantly being added by the Worshipful Company of Carpenters (of which Company the Professor is a Past Master), by the Council of King's College, and by the leading manufacturers of building materials in many parts of the World. The

struction Section of the Congress of the British Institute of Public Health, and was appointed hon. president of the 10th Section of the International Congress of Hygiene and Demography at Buda-Pest. Even Parliament has not escaped his energetic attention, and he represented north-west Wiltshire for a short period in 1885, and only just escaped winning Bournemouth for his party at the last general election. Like all politicians, he has the only solution to the Home Rule question, and he is welcome to keep it. Anything more antagonistic to the study of an artistic profession than membership of the House of Commons it would be impossible to discover, and it is indeed lucky for architecture that Professor Fletcher has made the practical and theoretical side of his work his first ambition, and that in this he has succeeded, beyond any of his compeers, no man will question. Yet it is odd that the one great hobby of this delightfully practical man should be the collecting of specimens of

during the present season. Like the Professor, they have also interested themselves very deeply in the welfare of the Building Trades' Exhibition, which is undoubtedly the best of the series yet seen in the Metropolis.

The diocesan monument to the late Bishop Claughton, of St. Albans, is now finished. This memorial, which is the work of Mr. Forsyth, consists of a recumbent effigy of the late Bishop, executed in the purest statuary marble, resting upon a cenotaph, mainly of alabaster, enriched with coloured marbles and armorial bearings. It is set up in the north transept of the Abbey.

The Halifax infirmary buildings are to be purchased by the Town Council as a site for the proposed new police offices. The Council is in favour of erecting police offices and a Court-house at a cost not exceeding £8,000. An enquiry has been held relative to the application of the Town Council for sanction to borrow £33,000 to complete the new markets.

ARCHITECTS OF TO-DAY: THE BUILDING OF THE FUTURE.

By MR. W. M. CONWAY.

BY the extreme courtesy of our contemporary, the *Daily Chronicle*, we are enabled to reproduce two of the charming copyright drawings by Herbert Railton, which appeared in the *Chronicle* last Tuesday, illustrating an article on "London Architecture: Its Past, Its Present, and Its Possibilities," by Mr. W. M. Conway. The article, though couched in a grandiose strain, evidences Mr. Conway's cheerful, if somewhat dreamy optimism, and contains practical passages of value and interest. Here and there Mr. Conway may be described as writing after the manner of Mr. Edward Bellamy, especially in his forecast of the future. Though we are loth to agree with Mr. Conway upon several points, notably his wholesale advocacy of iron and steel as building materials, and cannot say that his "model street"—seen even in the perspective of Time—appeals to our architectural sensibilities, we quote liberally from the article in view of its current moment. For the beauty of the drawings, and the brilliant way in which the *Chronicle* people have mastered the rotary's disinclination to print fine line blocks, we have a sincere admiration, knowing well the difficulty over-come. Illustrated daily newspaper journalism has scored.

Of almost every English town now standing, writes Mr. Conway, nine parts out of ten have been built in the present century, and almost during the lifetime of the present generation. Our towns have been built by jerry-builders—whole streets and quarters together—and the pleasure of the inhabitants was never so much as thought of. Architecture, therefore, of any sort was simply not produced. Four walls and a roof, with holes to let in light, doors to admit people, and chimneys for the exit of smoke, do not constitute architecture. There must be a definite intention on the part of the builder to give pleasure, either by mere excellence in the proportion of parts, or by added decoration. All over London you may see jerry-builders' advertisement decoration, intended to entrap the snobbishly minded into the belief that the building it is plastered on is "stylish," just as the duller sort of tradesmen advertise what they are pleased to call "art colours," as though all colours were not in themselves equally artistic, the art lying merely in their combination. Thus, for example, you will find, nine times out of ten,

decoration stuck on to the upper part of a building, where it is of necessity invisible from the street. It looked well enough, no doubt, on the architect's elevation, and served the purpose of a commercial architect by taking in a commercial employer. If you want to find the best domestic architecture of our day, you must search out the houses which have been built for people who intended to live in them. There is a charming little Gothic house at the bottom of Park Lane, which no one would have built to let; there is the really admirable Yellow House in the Bayswater Road, and the Red House near it; and there are a few more scattered about the town. But most of the good modern houses are in the suburbs of our large towns. The good ones are

a decided success. Its outline is good, and it possesses dignity of mass. Seen from the river on a normal London day, it is an impressive object, and in the perspective of the Thames Embankment, its simplicity forms a valuable contrast to the fretted elaboration of the Houses of Parliament. But the best test of the present architectural tendency, whether it be upward or downward, is not so much a comparison between scattered existing buildings, but a comparison between the younger generation of architects and those of five-and-twenty years ago. No one will deny that, whatever the general aspect of our towns may be, there are growing up to-day a larger number of promising young architects than has been the case for a long time. They arise out of the same movement

that has been producing the new group of sculptors and decorators whose like England has probably never possessed in such number as now. But these architects—what will their architecture be like? Will it be a new architecture, or will it merely be the old, well-designed, if you please, instead of ill-designed, but in principle the same? Undoubtedly it cannot but be new. No style of art or fashion can ever be recalled, for the art of any day is the expression of the people of that day. At the present day all the styles of the past are known and understood, and experiments are constantly made of combining and compounding them to suit modern needs and methods of construction. Out of these experiments a new style will arise, but he would be a bold prophet who would undertake to describe what it will be like. There are four factors which an architect must always consider—the purpose for which his building is to be used, the materials of which it is to consist, the position it is to occupy, and the atmosphere through which it is to be seen.

THE YELLOW HOUSE, BAYSWATER: ERNEST GEORGE AND PETO, ARCHITECTS.

numerous in absolute quantity, but, of course, few in proportion to the bad. The provision of large flat surfaces, in suitable positions and of suitable dimensions, is always advisable in London, through whose grey and dense atmosphere large masses and bold outlines alone have value. It is seldom nowadays that a series of houses forming the side of a street are designed as a whole. Modern public buildings in London have in most cases been conspicuously ugly, but exception must be made in favour of the New Scotland Yard Bastille on the Thames Embankment, a building much criticised at the time of its erection. It has stood the test of criticism, and is now admitted to be

Who shall say what are to be the conditions of life in the next century in England? London will either spread over all the home counties, and concentrate with electric swiftness for its day's work, or it will pile itself into the air and become a city of towers. Probably both these developments will go on together. One thing is certain—the building materials of the future will not be those of the past. Stone, wood, and brick have had their day, and the age of metal has begun. Steel girders have supplanted arches. The functions of concrete, in combination with steel, are many. But perhaps steel will give way to aluminium, and concrete to paper. Imagine a city of aluminium and paper build-

ings made to take to pieces. A man would move his house from place to place as easily as he now moves his furniture. There would be no more building leases. No one would dream of buying the freehold of his site. Towns would wander about as fashion and convenience dictated. We should dwell, as it were, in tents like our remote forefathers.

The coming architecture will have problems to confront such as no architects of the past have confronted, for it is evident that the day for buildings of great size has come. The miserable miles of little badly-built houses run up in haste to hold our suddenly-increased town populations were not made to last. They will be replaced by houses for which Chicago Exhibitions will be the shops. A brave County Council might lay out the first artery of New London in the style of the future, and profit greatly by so

you pleased. Here and there would be public lifts by which the various levels would be accessible from the street. The perspective of such an avenue, with the tiers of arcades on either hand, the bridges across it at different levels, and across the side streets turning out of it, would be beautiful, if good proportions were obtained, especially in the grey English atmosphere, wherein details of decoration vanish, and the architect's chief power to charm lies in the balance and relation of masses. Each block of houses forming the street would be built around a square, access to which would be obtained for the purpose of all services by back streets for carts entering by archways. All the pavements being covered, foot-passengers would be enabled to defy rain. If the street were wide enough, there might be an open cutting

GETTING ON APACE: THE NEW LINE TO LONDON.

THE New Line to London is getting on apace. Although the severe weather has retarded progress in most of the localities covered by the seven contracts into which the work is divided, the important tunneling operations at Nottingham have not been affected, and one of the contractor's engines ran right through a section the other day. At the Company's Gorton Works, fifty engines are being built for use on the extension to London. They are express passenger bogie engines, seven-feet coupled driving and trailing wheels, and in size the next to the "Greater Britain" class of the London and North-Western. The boilers will be 170 lbs. pressure; 4,000 gallons of water will be carried, instead of 3,500, as borne

NEW SCOTLAND YARD: NORMAN SHAW, ARCHITECT.

doing, for in the midst of five millions of people only large schemes can pay. The street would run, let us say, north of and parallel to the Strand. It would be as wide as Portland-place, or wider. The whole would be built on a single scheme. The ground floor right along would be shops. The broad pavements would be arched over with arcades open to the street. On the top of the arcade would be a first-floor pavement by which access would be gained to the houses or shops on the first floor. This pavement would be carried across from block to block by bridges, and other bridges would be flung across the main thoroughfare at convenient intervals. The second, the third, the fourth, and I know not how many more stories, would be similarly treated. It would be possible to circulate all over the whole new area at whatever level

down the midst for an electric railway, and on either side of it, under the roads, would be tunnels for the many pipes which modern life employs. Avenues of this sort carried in all directions from the heart of a great city towards its suburbs would enable communications to be direct and rapid. Near the centre the houses would of necessity be very high; they would diminish in altitude as the circumference was approached. Such buildings would accommodate many more inhabitants per acre than are packed into our densest slums. The various social strata of the population would be able to live near together in different stories of the same group of buildings. People might again live over their shops, and only the manufactories would have to be banished from the area devoted to distribution and consumption.

by the present type. The larger quantity will lessen the necessity for stoppages, with their inevitable risks of delay in stormy weather. Good speed will be got out of these noble engines, certainly sufficient to do the run from Manchester to London within the time now taken ($4\frac{1}{4}$ hours), at least. A little later the Manchester, Sheffield and Lincolnshire Company will invite tenders for the construction of 76 engines, in addition to the half-hundred they are themselves building at Gorton. That will be the largest order given out in engines for many years in this or any other district. Afterwards will come the carriages and waggons; these are much more speedily put together than the engine, which is the head and front of train things.

THE enlargement of the workhouse of Thrapston, at a cost of £1,500, is under consideration.

"STRAY THOUGHTS ON COMPETITIONS."

By MR. G. H. WILLOUGHBY, F.R.I.B.A.

WE publish extracts from a paper recently read before the Manchester Society of Architects, by Mr. G. H. Willoughby, F.R.I.B.A. The pressure upon our space compels us to curtail the context here and there, but we are glad to be able to print the gist of Mr. Willoughby's excellent "Stray Thoughts on Competitions."

A paper on "Competitions" as at present in vogue, said he, has its own field of usefulness, and may prove of some little value to our younger practising architects as well as to those who aspire in the near future to become practitioners. I have classified my "Stray Thoughts" into three main headings, viz.:—Firstly—The professional aspect of competitions. Secondly—The public aspect of competitions. Thirdly—A few general objections, and remedial suggestions. Doubtless, the "first" thought uppermost in the mind of most architects, reared in the midst of this busy commercial community, will be, "Does competitive work pay?" Let me say, at once, that my adherence to and advocacy of the system of competitive work as a legitimate means of furthering the practice and enhancing the position of our younger practitioners constantly gains strength. There is a disposition I know, among certain of our professional critics, to judge every enterprise by its event, and believe in no wisdom that is not immediately endorsed by success till they sympathise with nothing for which they cannot take out a policy of insurance. But have we not many recent instances of earnest and hardworking men who, mainly by their dauntless and untiring energy and perseverance in competitive work, have risen both to eminence and affluence? Not only to the followers of his own profession, but also to the World at large, Mr. Waterhouse affords a good example of what the possession of great talents may effect when combined with steady cultivation, careful study and patient application. Mr. Waterhouse has trodden no royal road to achieve the success which for some time has been his. It is only the reward for many years continuous hard work, the foundation of which was laid by his success in competitions. Sir John Lubbock, in his "Pleasures of Life," has told us—"That there never was a time when modest merit and patient industry were more sure of reward." Close around in this great city lies work enough to task every head and heart among us, and I venture to affirm that, if we only do the smaller work undertaken thoroughly and faithfully the larger is sure to follow.

From my point of view, it is a mistake to suppose that the profession can dispense with healthy, stimulating competitions. A man never knows what is in him until he has measured himself with his fellows in real honest work of this kind. Consider what a large field for effort is presented to our younger men at the outset of their career, when youth, with its enthusiasm and capacity for work is so strong. With many, the commissions which they have in hand, fail to fully occupy their time. Does not the opportunity thus afforded through the medium of competitions—and which, I think, is confined to our profession—create, if grasped, a lasting habit of steady continuous application and activity, a prelude to the time when hands and head will be fully occupied on more certain work? In my advocacy, however, for the full display of our enthusiasm and energies through the channel thus presented, in order to lay the foundation for a successful career, I should not like you to be under any misapprehension as to my procedure. Our aim should be to guard against apathy on the one hand, and excessive and

exhausting labour on the other. Still, there may be among my hearers—to some who yet will be disposed to doubt and reiterate my opening query—"Does it pay?" Let me remind you of the endless opportunities which cross our path through the medium of competitive problems for the study and investigation of the many kinds of structures the architect of to-day is called upon to design. Frequently are we compelled, before making a new venture, to seek, and then to thoroughly satiate ourselves, with the ideas and treatment we find in the best and most successful work of our eminent modern practitioners, both by the careful perusal of illustrations, as well as a personal inspection of their erections. The knowledge and grasp of the requirements of any structure thus acquired—as well as the familiarising of oneself with the mind and method of some eminent specialist—will be a clear gain to the earnest competitor, and from my own limited experience, I can affirm the result will be a joyous one; and will, in the near future, bear succulent fruit. It is recorded of Sir Joshua Reynolds, that he once said, in reference to his own profession—a sister art to ours—"He who never ransacks any mind but his own, will soon be reduced from mere barrenness to the poorest of all imitation. He will be obliged to imitate himself, and to repeat what he has before often repeated." Is not the "trend" of some of our younger men, who look askance at competitive work, to drift into that self-satisfied and crystallized state, while their work ultimately becomes reduced from mere architectural barrenness to the poorest of all imitations, having to repeat what they have before often repeated. But I can anticipate some very correct and precise brother practitioner—a past master of styles—demurring against the doctrine I have recently been advocating, and which, in his eyes doubtless is bordering on plagiarism. So far as the "clothing" of the structure is concerned, with certain reservations, I can fully concur, but as to the skilful planning of an edifice, wherein you will all agree a large share of the success of competitive work lies, we must work with an open and a receptive mind, ready to gladly welcome and to adopt any new ideas and fresh treatment that may commend themselves to us, from whatsoever quarter we may obtain them. A few years ago, at a meeting of the Royal Institute, the President for the Session in his opening address, especially laid stress on the necessity of our profession producing living progressive Architecture. As his remarks seem to me so very apposite and bear out what I have been endeavouring to lay before you, I will quote them. He said:—"It is certain that the past did not respect its own past as we do ours, and our practice, commendable as I think it, has, no doubt, its dangers. If we are for ever dwelling on the past, we shall not be self-reliant, and if not self-reliant, we shall never be bold, originating Architects. We may love and reverence the past as Archaeologists, but as Architects let us not forget that Archaeology is the bane of living progressive Architecture, and if our art is ever again to evoke popular enthusiasm, it must do so by embodying the thoughts, the aspirations, and the genius of the living people for whom we build." There is one more "thought" so intimately connected with the whole question—viewed from the professional side—that I think it ought not to be passed over without comment, however briefly. It is the deplorable preponderance of misdirected effort competitive work produces. One is confronted in almost every competition with the melancholy sight of many meritorious Architectural productions, possessing picturesqueness of grouping, excellent proportions, combined with artistic and well-designed detail, yet, having all chance of their success nullified by the utter

unsuitability of the design, which is frequently mated to an indifferent and ill considered plan. These artistic, but impracticable productions, are greeted with the admiration both of the profession and the general public, but command nothing more substantial. Those who allow their prolific pencil to have the upper hand, resulting not unfrequently in relegating to quite a secondary consideration the actual needs and inexorable stipulations of "Competitive Instructions" given for their adherence, and who prefer to follow the bent of their own sweet will and pleasure, are only amusing themselves. It is misapplied energy, and any chance or probability there is, of their clever but impracticable designs being chosen, becomes merely a vision of their own romance. Mr. Ruskin, in his "Seven Lamps," has written:—"I do not know so magnificent a marking of human authority, as the iron grasp of the Venetian over his own exuberance of imagination." May we not also profit by this estimable trait of human restraint in the Venetian Architect?

Before passing on to my next heading, I should like to say a word or two with regard to the etiquette aspect of Competitions. There is still floating about, even among many practising architects, who on other matters are not without intelligence and discernment, that strange notion, that to be engaged on competition work is somehow derogatory from a professional point of view. These men, who ought to know better, ceaselessly deprecate, in very doubtful taste, the praiseworthy efforts made by their more enthusiastic and energetic fellows through this medium presented to them. Let me, in concluding my remarks under this heading, urge upon every practitioner, devoted to his work, neither to be daunted nor baffled by any retrogressive hindrance that may arise either from within or from without, but to spend every resource and every effort in the prosecution and furtherance of so great and so noble a profession, to which it is his privilege to belong. I will now pass on from the practitioners' view of competitions to that of the general public, and briefly consider how this section of our work is regarded by them. To-day, almost every municipal or educational body, be it corporation, trust, board, or committee, having the erection of some structure in prospect, either of an ecclesiastical or of a secular character, usually relies on the competitive system to obtain a suitable design. Of the frequency of this procedure I think you will all bear me out. In the first place, by this method a strong belief and advocacy in the policy of "Free Trade" is shewn. Liberty also is afforded for any qualified practitioner to dispose of his wares, i.e., the product of his brains and skill, wherever that kind of merchandise is in requisition; and thus a wide field of additional opportunity and usefulness is opened out to us, one which may largely conduce to the greater prosperity of our profession. Again, the competitive system is largely instrumental in bringing about an entire immunity from those petty jealousies which we all deplore but which are frequently experienced in many provincial towns, where several practitioners are about equal in status, professionally and socially. If competitions be framed or conducted on strictly equitable lines (which is of paramount importance and to which I shall shortly refer), then the spirit of emulation being stirred, each competing architect is depending entirely on the merit of his effort, and not on the number and the influence of his friends. It follows that the discreditable and unprofessional touting—which is greatly to be deprecated, but which is only too frequently resorted to—at once ceases, and a more honourable and equitable state of things is obtained. There is one other advantage I should like to point out: that the public obtain through their encouragement and adoption of competitive

work; it is the benefit of having any contemplated architectural project attacked by a number of distinct minds, and the results submitted for their inspection and choice. Frequently one's attention is arrested, whilst inspecting competitive designs, by some that exhibit a freshness of conception, an originality and a boldness, doubtless drawn out by their author's zeal to excel, and which I venture to state would not be obtained through any other agency. My paper would be wanting and incomplete were I to omit any allusion to the abuses that occasionally are perpetrated through competitions, and to which practising architects are liable to be exposed. I think also a remedial suggestion or two may not be out of place. Perhaps the time has now come when the question may be asked: Are the means usually adopted in the framing and conducting of competitions to-day such as can command general approval? In the majority of instances, recently before the profession, this unquestionably has been the case. For some time a marked "upward trend" has been shown by the public at large in the framing and conducting of competitive work, and in the strong inclination and wishfulness to act with strict impartiality. Is this not only a very gratifying, but a very stimulating augury, especially to our younger practitioners? But there is also another side—the seamy side. Many of us will recall with pain the heart-burning and strong sense of indignation we have been occasionally subjected to by a flagrant deviation from rectitude and fair dealing on the part of the promoters of some competition into which we have been cajoled to enter. The indifference displayed by such unscrupulous people to the inexhaustible patience, time and labour, that architects have fruitlessly given, is so inconceivably deplorable that it will hardly bear discussion. The question as to how this particular evil is to be remedied forms part of the larger question affecting the whole subject. Have we not the remedy mainly in our own hands? It is invariably the case that in these "questionable" competitions, the "instructions" are neither drawn up on lines suggested by the Institution, nor by some practitioner, nor is any mention made as to the promoters' intention to call in a professional man to advise in arriving at a decision. With these very ominous omissions clearly before us, it is our duty to our profession, as well as to ourselves, to leave all projects framed on such doubtful lines severely alone, and I, for one, shall gladly welcome the day when every practising architect shall consider it his duty, as well as his privilege, to become a zealous and enthusiastic supporter of the Royal Institute, thus further to strengthen its hands, by which alone it can successfully cope with some of the disabilities we still have. Perfectly, I am aware, that in my adherence to and support of the Institute, as the remedy for wrongs, I am at variance with some of my fellow workers, who are hostile both to my views and my method. In this room I have heard persistent indictments hurled against the Institute and its doings, displaying a curious example of misdirected indignation, in my opinion, totally and absolutely unwarranted. In a recent annual address given to this society, Mr. Knill Freeman, the then president, referred at some length to the importance of this matter, and, summarising his remarks, said: "It is by association with the Institute we shall best strengthen our own position, whether individually, professionally, or as a society. In each of these relations our advantage in the connection is clear, but even if it were not so, our duty is plain, and we are not, I am sure, likely to ignore it." Should not words so forcible and significant, and coming from one of our older members who has borne the burden and heat of the day, induce those of our fellow workers, who

at present stand aloof, to take a broader view, and play a worthier part in fostering and advancing our professional privileges and rights, not only for our own progress and advancement, but for those who will come after. In my appeal for this, I will close by a quotation from Ruskin. One which, I think, fully endorses the soundness of my advocacy: "When we build, let us think that we build for ever. Let it not be for present delight nor for present use alone; let it be such work as our descendants will thank us for, and let us think, as we lay stone on stone, that a time is to come when those stones will be held sacred because our hands have touched them, and that men will say, as they look upon the labour and wrought substance of them, 'See! this our fathers did for us.'"

ARCHITECTURAL IRONWORK: CONSTRUCTIVE AND DECORATIVE.

*A Series of Instructive Papers for the
Artist and Worker.*

CHAPTER V.

BEAMS AND GIRDERS.

IN the old days of timber-building all beams and girders were, necessarily, of timber, oak being extensively employed. The first step towards the utilisation of iron in this direction was made by the construction of composite girders. When a very strong girder was required to sustain an extremely heavy load, it was found better to build it up of several stout scantlings of timber, securely bolted together, than to use one solid log or baulk. A further improvement was afterwards effected by using a flitch, or plate, of cast iron for the central portion of the girder, having flitches of timber on each side of it, and the whole strongly bolted together. From this composite member the cast iron girder was a necessary and certain evolution. Considerable knowledge of the stresses incident to architectural construction has been brought to bear on the important point of the best manner of proportioning horizontal iron building members, such as beams and girders, and accidents seldom occur through weakness of these architectural members at the present day, though such do now and again happen. The sectional form of iron beams and girders generally differs from that of similar members

Figure 9

when these are constructed of timber, which, of course, is now very rarely the case. These latter, when used, consist of squared bulks of oak, pine or other suitable timber, have a rectangular and usually parallelogrammatic section. In consequence, however, of the progress of statical inquiries of late years, great scientific technical investigators have carefully studied the different stresses incident to such beams, and the behaviour of these latter under such strains and pressures.

In considering this subject philosophically observers have viewed a beam, a wooden one primarily, as composed of a series of fibres running longitudinally in the direction of the "grain" of the wood, as shown at A in Figure 9, which roughly represents a

beam or girder having a bearing at each end. If now this experimental beam be loaded in the middle, as the weight is added, the beam will become "ragged" or deflected in the middle, until it becomes concave on its upper surface and convex on its lower plane. This fact shows that the uppermost fibres are being subjected to a compressive or "crushing" strain, and the lowermost to an extension, tensile, or tearing strain, a rough idea of which we have endeavoured to convey at B in Figure 9. This fact will be rendered more evident if weight be added until the beam is ruptured or broken. It will then be found that the fibres of the lower surface of the beam have been torn asunder, while those of the upper surface are compressed, being squeezed and crumpled up at the points of fracture. Anyone can verify this by bending a stick or bit of firewood to the breaking point. As it necessarily follows that the crushing strain is most severe at the upper surface of the beams, and becomes less as it goes downward; while, on the other hand, the tensile stress is most severe at the bottom of the beam, and lessens as it goes upwards, there must be a point in the centre of the beam where these strains neutralise each other, and where the fibres are neither influenced by compression or extension. This point is known in scientific phraseology as the "neutral axis," and remains unharmed until an absolutely crushing weight is applied, under which at length it is compelled to succumb. The foregoing facts are of importance, as they constitute the principles which have led to the form of girder section generally adopted in iron, that is to say, two flanges connected by a central web, more or less closely resembling this , or an aitch sideways. In considering B in Figure 9, the designer perceives that the stresses to which such a member is subjected take effect mainly upon its upper and under surfaces, and that the central part containing the neutral axis is only important as uniting the upper and lower portions. As wood was a comparatively cheap material, a large beam having an extensive rectangular section could very well be employed. With iron, being a relatively costly material, and more so formerly than now, it was, however, perceived that such a section was both wasteful and unnecessary. The designer then provides his upper surface to resist compression, and his lower to endure extension, and dispenses with all intermediate material except a narrow web to unite these upper and lower surfaces or "flanges." Thus, then, the ordinary or I shaped section of the girders at present in use is scientifically arrived at. As, however, the tearing strain is more severe than the compressive one on such a member the upper flange is very often made less wide than the lower one, and the section shown at Figure 10, shows the shape very often adopted at the present time, although such is not universally the case, while in the earlier days of the employment of iron as a building material it was otherwise. From its form this section of girder is very usually termed a T-girder. That this is the most stable and useful figure of section has not only been deduced from philosophical reasoning, but fully and conclusively proved by actual experiments conducted by experienced technologists.

Figure 10.

(To be continued.)

THERE are two hundred and six thousand four hundred and fifty-six miles of telephone wire in England.

"IRON AND BRASS."

By MR. J. W. SINGER.

[Being Continued Abstracts from a Paper read before the Architectural Association.]

HOW wide a subject is that of iron may be understood in mentioning that in Great Britain alone, there are 16,000 places where the same is dealt with in some form or another, and 7,000 persons as principals are engaged in carrying out industries closely connected with it. Even the various forms of iron are each a study not easily mastered, there being so many varieties of this metal, each of which is again subdivided into many brands, even the furnaces for the raw material producing many different sorts, some turning out Hermatite, others the kind called "Mine," or "Part Mine," also cinder or Ferro-Manganese; and in steel works there are the different sorts of Bessemer, the open hearth, and the crucible. There are also thirty-four distinct allied trades connected only with the manipulation of iron, not including the production of the raw material, from anchor-making to wire, chain, and rope making, nail works, &c. There are many varieties in even the sub-division of wrought-iron, the merchant from whom we purchase this metal, having on his list eight sorts of wrought and fourteen kinds of steel, the wrought-iron varying from £6 10s. up to £22 a ton, the steel running from £12 to £68 a ton. Each of these would have a different brand or mark, each of the varieties being the production of a special firm. To ensure good iron being used, it would be well for every architect to know the hieroglyphics on it, as the appearance of bars at £6 10s. a ton is much the same as that costing three times the amount. Thus the cheapest iron is Welsh, having A and a crown impressed on the bars; the next is that having N H and S with a crown—this being Staffordshire—costing £7 5s. a ton; the next quality has Netherton Best, with a crown between the words; after this, comes the old brand of B. B. H., this is £8 10s. a ton. S. C. with a crown is very fine iron at £10 10s. a ton; charcoal iron has the letter L in a circle, this being £17 a ton, and is used for cylinders, boiler-plates, and engine-iron, where great tenacity is required. England has long been famous as the centre of the iron industry of the World; but I fear there is a warning that we have passed the zenith of our prosperity, for Germany and Belgium are fast treading on our heels, the President of the Iron and Steel Institute, in his late address, giving a warning when speaking on this subject, saying that from 1873 to 1875 our exports had fallen from thirty-seven to twenty-five millions' worth of iron, that is twelve millions less in only two years, and at even that low state they were five millions above the exports of 1893, which deplorable state of things arose from the increased price of coal, and the lamentable strikes throughout the land, although the wages paid to our men were fifty per cent. above foreign workmen. With such competition how can England compete with the World in this industry, and her greatness in the iron trade, is I am afraid, a thing of the past, unless a change comes over the mind of the British workman. Where iron plays an unassuming but useful rôle as an accessory or adjunct, to a building it finds its best expression. Within this limitation, quite enough field is left to tax all the energies of the metal-worker. Its strength, durability (if properly treated), and the way that it lends itself to every method of manipulation are the qualities that specially commend iron for application in connection with architecture, for screens, grilles, gates, lighting purposes, door fittings, &c. In door-fittings, for example, what force and vitality there are in some of the old hinges, from the almost

plain strap, with its few vigorous marks, to the forged and chiselled masterpieces of the twelfth, thirteenth, and fourteenth centuries. Possibly our modern smiths will never excel them. I venture to hope, however, that in another branch, namely, screens, we may yet make much advance. The old smiths laboured under many disadvantages in this respect compared with ourselves. They had no machinery as we have for producing bars of all shapes and sizes. Thus for large screens they had to fall back upon wood and stone. Screens may be made to exhaust all the resources of the metal-worker—forging, chiselling, piercing, repoussé work, enamel and addition of various metals, mouldings of all sections, and tracery, scrolls, and leaf-work of every kind. I need not mention that several eminent architects have drawn attention to this interesting subject, and I little doubt that it will receive still more in the future. There are several features that should make us hopeful of the future of iron-work in this country—namely, the attention now given it by architects, also the help now rendered it by science, so that good iron and steel can always be obtained with care in selection. I think I am also justified in saying that many of our smiths have attained a wonderful amount of skill. No doubt what we most lack is the taste, or instinct, for what is within the power of the material. Also probably we are only gradually learning how much of the work should be done within the glare of the smith's fire, and how careful one has to be not to take the life out of the work afterwards. I must now say a few words upon the subject of brass. From an artistic point of view this metal does not hold so high a position as bronze, as it is inferior to the latter in many important qualities. Its colour is not so good, its contraction in casting is greater, and in a molten state it does not run so freely into the mould; also it is not so satisfactory a metal for the chaser to manipulate. Still, it is the better known and most-used metal of the two, one reason being doubtless that it is cheaper, unfortunately a most important consideration in these days. Bronze is the metal in which the sculptor usually produces his work in metallic form; brass, on the other hand, being the metal we see around us in the numerous objects of everyday use. Brass is a compound alloy of the two metals copper and zinc, bronze being an alloy of copper and tin; and it is difficult in any historical account of these metals to distinguish clearly which is intended in any earlier mention of brass than 1721, when zinc was discovered, or rather produced by Henckel, as a commercial metal. But the word brass has been used far longer than this idea of the metal as is now understood by that term, and the name for it has been supposed to come from the Spanish word "bravas," meaning the colour of flame, our word "brazen," with its many meanings, no doubt being derived from the glaring appearance of the polished metal. It may have been bright copper or bronze of which the brazen serpent was made for Moses, and so also when we read of "Brass as precious as gold" for the vessels which Ezra caused to be made for the Temple; but this much is certain, that all the metal work which Layard found at Nineveh was made in bronze and not brass. So, no doubt, was the famous Colossus at Rhodes, 105 ft. high, taking twelve years to make, costing 300 talents, equal to about £118,000 of our money. The progress in modern manufacture may perhaps be in some way indicated when I mention that our firm has been allowed less than the same number of months to reproduce a monument in bronze about half the size of the Colossus, and I regret to say that for this work we receive only about one-hundredth part of the sum that was paid for the Rhodian giant. That it may be seen how difficult it was to produce large pieces of so-called brass, I may

mention that up to the fifteenth century it was found impossible to make a piece of metal which could be hammered out as sheet brass beyond about 2 ft. square, whereas now it can be had 20 ft. long, but even at this late date the metal was more bronze than brass, from its having tin in its composition. Brass as a metal was so costly, that in the sixteenth century they often destroyed earlier memorial brasses by turning them round and cutting the new designs on the back of the older ones. Brass-work, strictly so called, was not attempted in England before the time of Henry VII., and the railing round his tomb in Westminster Abbey was soon after made, the trade getting general in the time of Elizabeth, who encouraged workmen from the Low Countries to come to England. Yet in 1649, some large works established at Esher, in Surrey, proved a failure, ending in ruin to the founder. The next attempt was in 1678, when the Prince Rupert Mills were started. Then came some works at Hackney, called the Temple Water Mill Works, water being used to drive the hammer, this being before rolls were invented. After this came the Baptist Mills, at Bristol. Up to this time, brass was only produced by using calomine, and melting copper with it, but in 1721 pure zinc was produced, and great changes took place soon after in the manufacture of brass. As already stated, this metal is a mixture of copper and zinc, and these are run together in a state of fusion, in various proportions, to form the many kinds of brass that are needed—copper being the chief part of the alloy. The Japanese are said to have 200 varieties of these alloys, according to the colour they desire in the finished metal. The zinc group gives:—5 parts copper to 1 of zinc to obtain rich sheet brass; 4 parts copper to one of zinc for Pinchbeck brass; 3 parts copper to 1 of zinc for Dutch metal; 2 parts copper to 1 of zinc for ordinary yellow brass; 1.75 parts copper to 1 of zinc for pale brass; 1.25 parts copper to 1 of zinc for dipping brass; 1 part copper to 1 of zinc for hard solder, it being understood that the more zinc is used for the alloy, the cheaper is the metal produced, and the less durable it becomes. Although my remarks are upon brass, it may be well to give the alloy of copper with tin, *i.e.*, bronze, as these metals are so closely allied. 20 parts copper with 1 of tin gives a rich red metal; 10 parts copper with 1 of tin gives the best form of bronze; 4 parts copper with 1 of tin gives bell-bronze, which is brittle, and unfit for any other use. The best metal for taps, cocks, &c., is composed of 4 parts copper, 1 lead, 1 zinc, and $\frac{1}{2}$ of tin. Up to a late period of the last century the manufacture of brass was a slow and tedious process, taking at least twenty-four hours, as they used the carbonate of zinc, or calomine, with the copper, in taking that time to reduce the ore, and unite it with the copper; but now that the metal zinc can be obtained in a pure state, the process can be completed in about an hour, for as soon as the copper is melted, the zinc is then added, either in a molten state, or is plunged down to the bottom of the molten copper, and then well stirred, or in the casting, the zinc being the lighter metal, will be found too much in the upper part of the casting. Any of the above alloys can be easily cast, but no ornamental work, or any object, excepting plain block ingot, can be cast in copper alone, the contraction of this metal in its pure form being so great that, when cooling from the molten state, it pulls itself to pieces when anything prevents that contraction. The difficulty attending contraction will be seen when I mention that the base of the statue of Lord Napier contracted just over one inch, and if provision had not been made for this, this mass of metal, weighing nearly half-a-ton, would have pulled itself to pieces in cooling.

Trade and Commerce.

We shall be glad to receive copies of catalogues from firms engaged in the allied building trades. These will be carefully looked through, any novelty noted, and—should its nature seem to demand it—fuller attention drawn thereto. We are particularly wishful to secure the friendly interest of designers and artificers in *THE BUILDERS' JOURNAL*, and, now and then, we might see our way to reproduce an outline sketch or illustration of any contrivance that struck us as being new or needed. Building covers up—figuratively, and in fact—so much ground, and we mean to cover the whole of it.

We should be further obliged if firms would indicate, by some suitable mark, the pages in their catalogues to which they would, in particular, desire to call our attention.

Leicester Trade Unions.—The Carpenters', Bricklayers', and Labourers' Unions recently demanded from the master builders of this town an increase of wages and a revision of the rules at present in existence, the new conditions to come into force on the 1st of April. Since then, several meetings have been held, both of the employers and the workmen, but the negotiations have not yet led to a settlement. The chief demands of the men are an increase of 1d. per hour by the carpenters and bricklayers, and of 3d. per hour by the labourers. They also desire a revision of the working rules, and the abolition of reference to an umpire. Conferences between the two parties have led to no satisfactory result, and on Wednesday week a meeting of the Employers' Association was held at the Bull's Head Hotel, to consider their future action. There were 61 members present, and it was resolved to reject the proposals of the men, both as regards the increase of wages and arbitration. The next step will be a further consideration of the demands by a joint committee of six of each side, and, failing agreement by them, the whole of the matters in dispute, according to existing rules, should be referred to an arbitrator.

The Monthly Report of the Board of Trade states that "in the building trades the percentage of unemployed in Unions making returns has increased from 8.2 to 10.1, compared with 5.0 per cent. in February, 1894. The plumbers, however, have been well employed at the end of the month"—an item of news which every householder will regard as a truism. "A further decline is shown in the furnishing and wood-working trades, the percentage of unemployed in Unions making returns having risen from 6.7 to 7.0, compared with 5.8 per cent. in February, 1894."

Messrs. W. & R. Leggett.—This firm have lately completed, or are about to complete, the work of fixing their fanlights and other gearing to a large number of buildings. They have also again succeeded in obtaining the contract for a term of years from the London School Board for the whole of the fanlight and other gearing in their schools; Brighton Public Baths, Buckingham Palace alterations, North-Western Fever Hospital, Hampstead; South-Eastern Fever Hospital, Old Kent Road, London; new disinfectant, Newington Vestry; London Hospital, Whitechapel; St. Luke's Union, administrative blocks, London; Fulham Union, administrative blocks; St. Olave's Grammar Schools, London Bridge; Ward's School, Thames Embankment, London; Guildhall School of Music, London; Goldsmiths' Institute, New Cross, London; Grocers' Company Hall, London; Bishopsgate Institute, London; Woolwich Public Baths; Bow Baths and Wash-houses, London; Barclay & Co.'s Bank, Cavendish Square, London; Hong-Kong and Shanghai Banking Corporation, Lombard street; Holloway's Sanatorium, Virginia Water; Reading Town Hall; Vaudeville Theatre, London; Reading Union; Tivoli Theatre, London; Public Library, Drury lane; Central Hall, Holborn; New Admiralty Buildings; Drill Hall, S.T.H., Bow; Drill Hall, Bunhill Row, E.C.; Imperial Institute, Albert Gate; Hymers College, Hull;

Aston Baths, Birmingham; Technical School, Gloucester; Cornwallis St. Baths, Liverpool; Soap Works, Port Sunlight; Dye Works, Apperley Bridge; New Baths, Farnworth, Lancashire; New Infirmary, Halifax; Yorkshire Penny Bank, Bradford; Craven Bank, Bradford; Lotherton Hall, near Saxton, Yorkshire; St. Ann's Church, Bishop Auckland, &c.

Carpenters' Hall Lectures.—A second course of Free Lectures on Carpentry and Joinery is arranged to be given at Carpenters' Hall, under the auspices of the Worshipful Company of Carpenters, on the five Wednesday evenings of May. The lectures are illustrated by take-to-pieces models, large diagrams, photographs, and specimens of materials. The syllabus for the course is as follows: May 1st, Professor Banister Fletcher, "Timber and Composite Roofs;" May 8th, Mr. Thomas Blashill, "Shoring;" May 15th, Mr. James Bartlett, demonstrator at King's College, "The Setting-out and Construction of Staircases, and Joints in Joinery;" May 22nd, Professor T. Roger Smith, "The Framing and Construction of Partitions and Floors and Temporary Structures;" and May 29th, Mr. F. R. Farrow, "Strength and Strains in Wood."

New Banking Premises.—A New Bank is in course of erection at Wimbledon for the London and County Banking Co., from the designs of Messrs. Chiston and Perkins. Messrs. Johnson & Co., Limited, of Wandsworth Common, are the general contractors. The constructional steelwork and fireproof floors being constructed by Messrs. Mark Fawcett & Co., of Westminster, S.W.

Heating the Vaudeville Theatre.—Messrs. Crompton & Co., of 148, Brompton Road, have recently carried out the electrical heating of the Vaudeville Theatre. At first it was contemplated to use a system of hot-water heating, but, after carefully considering the matter, the management decided that electrical heaters afforded a more advantageous system. Twenty-two "box" or wall radiators and four large portable radiators, all of the Crompton-Dowsing type, are employed, and they answer the purpose admirably. The temperature of the theatre is maintained at 60 deg., while the corridors may be as low as 40 deg. The heating arrangements are under absolute control, and any portion may be turned off or on at will. The electricity used is taken from the Charing Cross and Strand Electricity Supply circuits and charged at 4d. per unit, and when all the apparatus is at work 9 units are consumed per hour. With electric radiators there is no danger of fire, as there is no combustion, and the temperature is about the same as that of hot-water pipes. The electrical cables are of Henley's highest quality, switches, cut-outs, safety connectors, &c., of the best, and Messrs. Crompton endeavour to make this pioneer installation complete in every respect. Some difficulty was at first experienced with regard to the fire office and London County Council, as no rules were in existence which covered the case; but all the authorities appear now to be convinced that electric heating, when properly installed, is very safe, and perfectly suitable for public buildings. It is stated that electric radiators are often used in an auxiliary sense where sufficient heat is not obtainable in buildings heated by hot water. They are also useful for chilly evenings, and at times when it is not cold enough to work the whole system of heating, but a little warmth is required in any particular room or portion of a room.

"Joints in Woodwork."—We have received a pamphlet, written by Mr. Henry Adams, M.Inst.C.E., Professor of Engineering at the City of London College, on "Joints in Woodwork." Originally read in 1877, Mr. Adams' paper has proved its usefulness by the many reprints that have been called for. The practical side of the subject is clearly dwelt upon. It would be almost impossible for a workman of ordinary intelligence to go wrong with this little treatise in his possession. The reprint seems to have been brought up to date.

THE Monmouth Town Council has applied to the Local Government Board for power to borrow £20,000 for drainage and electric lighting.

SAWDUST.

ARRANGEMENTS for the forthcoming Art Loan Exhibition at the London Guildhall are almost complete. The galleries will be open to the public from April 23rd to July 13th, both days inclusive. The hours will be from ten to seven every weekday, and three to seven every Sunday.

KING HUMBERT on Tuesday laid the first stone of a monument to Garibaldi, on the Janiculum Hill. It is hoped that the monument will be completed and unveiled by September 20th, which will be the twenty-fifth anniversary of the entrance of the Italians into Rome.

It is a sad and gloomy fact that there are in London 980 common lodging-houses, which have nearly 60,000 inhabitants. In these warrens are about 9,500 women and girls, and of this number some 4,600 are under the age of 22.

At the meeting of the London School Board, on Thursday, the salary of Mr. T. J. Bailey, the architect to the Board, was raised to £1,000 per annum. General Moberly proposed that an honorarium of £500 be awarded to Mr. Bailey, for special services rendered by him. The proposition, however, was not carried.

A CABLE, 25,000 metres in length, has just been finished at Seyne, and will shortly be taken to Madagascar by the English chartered transport.

The foundation stone of the new buildings of the Manor Park and Little Ilford Constitutional Club was laid on Saturday afternoon by Mr. A. Money Wigram, M.P.

THE smoke from smelting furnaces is laden with metals of value, the most notable of which are gold and silver. At an American smelting works mechanical means are being taken to collect the suspended matter from the gases.

At the recent meeting of the Upper Stour Valley Main Sewerage Board, the tender of Mr. John MacKay, Smethwick, for No. 5 contract in connection with the sewerage scheme, which comprises the main outfall works from Cradley Pool to Whittington, was accepted, the amount being £16,327 11s. 6d. The highest tender received was £30,624.

THE new Conservative club was opened at Windsor last week. The building is situated in Peascod Street. In addition to other accommodation, the club has a large hall for concerts and meetings.

THE division of labour in the Government dockyards is giving rise to much dissatisfaction amongst the various classes of employés. The shipwrights contend that work which naturally belongs to them is given to the carpenters and joiners, and a similar grievance exists as between the boilermakers and the engineers. Lord Spencer has already received two deputations on the subject.

FOR the new Free Library at Perth, which is estimated to cost about £9,998, the design by Messrs. Campbell, Douglas & Morrison, of Glasgow, has been selected.

Roadway Making.—Roadway making is by no means an easy art in Canada, where frost frequently penetrates over 4 ft. below the surface, playing havoc with macadam if it is not properly drained. The great difficulty is to get a good and cheaper foundation. Mr. P. S. Gibson, C.E., of Willowdale, to overcome the difficulty, has adopted a combination of corduroy, macadam, and gravel. He lays down second-class cedar logs of 6 in. in diameter at the smaller end inside the bark. These are laid at right angles to the centre line of the road in straight or curved lines, and earth is rammed tightly between them. Upon this foundation is laid the macadam, consisting of good hard stone, broken in cubical form, and of a size to pass through a 2½ in. ring. This macadam, about 6 in. thick, is rolled and consolidated, and over the whole is laid a layer of gravel 2 in. thick. Drainage is attained by laying down tile drains, discharging into ditches on either side. This system of road making, though somewhat strange to us, is said to answer very well.

Correspondence.

The Editor welcomes Correspondence on matters of general interest. Gentlemen thus addressing the Editor should condense their communications as much as possible.

"H. G.," Hatcham, S.E.—We are arranging or a series of plans. Thanks for your good opinion.

J. W. B., Leicester.—Any sketches you care to send us shall receive attention. Please let them be good!

"Sap," Alton, Hampshire, writes: "Would any correspondent oblige me with a solution? I have to pump 200,000 gallons in 24 hours; two-thirds would be from 6 a.m. to 6 p.m. The rising main will be 40 high, 440 yards long. What horse-power would be required, and cost (probable); also working expenses, about of steam, gas, oil."

Talbot House, Arundel Street,
Strand, W.C.

SAWDUST.

At the last meeting of the Wellingborough Urban District Council the clerk submitted a report from Messrs. Hodson, engineers, Loughborough, which stated that the estimated cost of the works of sewage disposal was £10,215. They considered the most advantageous way would be for the Council to advertise for the execution of the work in one contract. Alterations and additions to the workhouse are also contemplated at a cost of £3,500.

THE building fund of the new St. Peter's Church, Eastbourne, the foundation stone of which was laid in the autumn by the Duke and Duchess of Devonshire, who gave the site and £5,000 towards the cost of erection, has just been further enriched, an anonymous donor having sent £5,000 for the chancel, which, owing to the want of funds, the committee had not intended to complete at present.

SANCTION to a loan of £4,500 for erecting an isolation hospital at Heywood has been obtained by the Town Council.

THE question of erecting municipal buildings at Ossett, the estimated cost of which is £8,000, has been referred to a special meeting of the General Purposes Committee of the Town Council.

It is announced that the Italian Minister for Public Instruction intends devoting 100,000 lire towards the restoration of the Coliseum. A sum will be devoted for this purpose yearly until the restoration of the building, externally, is complete.

THE scheme for the erection of a model lodging house at Peterhead has been approved by the Town Council. The cost is estimated at £1,200.

WHITECHAPEL thinks of going in for the electric light. The estimated cost is £45,000. At present the question stands over for consideration by the District Board.

MESSRS. CHELAND AND BUNGAR, C.E.'s, Belfast, attended the last meeting of the Bangor Town Commissioners and submitted plans and report in connection with the scheme for enlarging the gasworks. The plans were generally approved of. The cost is roughly estimated at £2,500.

THE plans prepared by Messrs. Everard & Peck for the new technical schools at Leicester, to be erected at a cost of £25,000, have been approved.

THE principal matter of interest to the outside public in the meeting of the Liberator Building Society, was the Official Receiver's confession that he had not yet found a purchaser for the great hotel on the Embankment, which will be ready for occupation in April, 1896.

THE Local Government Board of Wortley has authorised the Guardians to erect casual wards at the workhouse, the cost not to exceed £1,000.

THE West of Scotland Steel Trade Conciliation Board met in Glasgow and discussed the wages question at length. It was ultimately decided by a majority that the men would accept the 5 per cent. reduction.

THE Loughborough School Board has resolved to erect new school buildings. Mr. Barrowcliffe has been appointed architect to the Board.

WHEN it is known that there have been exhumed more than seventy thousand statues from the ruined temples and palaces of Rome, the reader can form some idea of the richness of the Vatican.

WITH reference to the Northside Bridge and Road question, Mr. Wood, engineer, who has been employed by the Joint Committee of the Corporation of Workington, and some of the representatives of the works at the north side of Workington, has sent in to the Committee three sets of plans, prepared under his survey. The estimated cost of carrying out the plans ranges between £15,000 and £20,000.

MR. F. E. P. EDWARDS, of the surveyor's department, and Mr. F. B. Hobbs, Waterloo, have been elected Associates of the Royal Institute of British Architects, after having passed the final qualifying examination.

ABOUT two hundredweight of water from St. Winefride's Well at Holywell is, it is understood, posted every night in sealed cans to all parts of the country, America, and the colonies. To accommodate the expected summer influx of infirm pilgrims, a large new hall is being got ready, fronted by a statue of the patron saint in white marble.

St. James's Park lake has been drained off and the mud is being cleared away. The work will take about three weeks.

AN enquiry has been held into the proposal of the Stamford Corporation to borrow £7,000 for a new cattle market.

UNDER the direction of Mr. Charles E. Ponting, F.S.A., of Marlborough, the restoration of the old Bristol High Cross, which was removed from College Green 128 years ago, has just been completed. Messrs. Harry Hems and Sons, of Exeter, were the contractors.

THE picturesque building known as the Old Palace at Southwell, which was purchased by the late Bishop Trollope, and presented by him to the see of Southwell, has been carefully and thoroughly restored by Bishop Ridding, and will in future be available as a Church House.

At the recent meeting of the County Council, the Fire Brigade Committee reported that owing to the increased price of materials since the architect made his estimate for the proposed new fire station at Fulham, his figures would be increased from £10,500 to £11,000. The architect also asked that as the building was to be erected a few feet back from the line originally proposed, a sum of £400 should be added.

SIR JOHN MILLAIS and Sir J. D. Linton have have just been honoured by the King of the Belgians by appointment as officers of the Order of Leopold. Mr. Alma Tadema has been elected President of the Royal Birmingham Society of Artists in succession to Professor Herkomer, whose term of office has expired.

THE Western Mail buildings at Cardiff, which were destroyed by fire about eighteen months since, have been re-erected on a much larger scale. The architects are Messrs. J. P. Jones, Richards, and Budgen.

THE work of constructing the new bridge over the river Dee at Queensferry, to take the place of the old and cumbersome ferry, was commenced yesterday on the excavations for stone piles. The total cost will be £15,000.

THE new Infirmary at Lancaster, which is being erected from designs by Messrs. Paley, Austin and Paley, at a cost of £25,000, is approaching completion. It has been decided to invite the Duke and Duchess of York to perform the opening ceremony.

A NEW Primitive Methodist chapel, with school and class rooms, is to be built at St. Ann's road, Heeley, to seat 700 persons, and cost £3,800.

Westmoreland and other Descriptions of GREEN SLATES, also ROOFING TILES, supplied only, or fixed by Contract in any part

LONDON.—For alterations and additions to Nos. 187 and 191, and for re-building No. 189, Walworth-road; S.E., for Mr. Hyams. Messrs. Barnes, Williams, Ford and Griffin, architects:—

Pritchard and Renwick	£1,570	0	0
Peacock Bros.	1,548	0	0
Marsland	1,486	0	0
Shepherd	1,482	0	0
Tarrant, F.	1,460	0	0
Jarvis and Sons	1,429	0	0
White, A., and Co.	1,419	0	0

PETERBOROUGH.—For the erection of two dwelling-houses Bamber-street. Mr. J. G. Stallebrass, architect, North-street Peterborough:—

Bridgefoot	£500	0	0
Watson and Spriggs	498	0	0
Jellings	479	0	0
Bailey	470	0	0
Gray	469	0	0
Cracknell	449	10	0
Sibley	442	0	0
Wenlock	420	0	0
Guttridge (accepted)	415	0	0
Pape	405	0	0

(All of Peterborough.)

ROMFORD.—For the pulling down and the re-building of the Coach and Bell Inn, High-street, Romford, for Messrs. Goodchild Brothers. Mr. Arthur T. G. Woods, M.S.A., architect:—

Dowsing and Davis, Romford	£2,155	0	0
Rogers and Robson, Brentwood	2,105	0	0
Hammond, J. S., and Sons, Romford (accepted)	2,065	0	0

(Architect's estimate, £2,210.)

STRATFORD.—For erection of a block of school buildings to be known as Water Lane Schools, on a site at Stratford, for the West Ham School Board. Messrs. J. T. Newman and Jacques, architects, 2, Fen-court, Fenchurch-street, E.C.:—

Potter, J., Horsham	£22,765	0	0
Stimpson and Co., Brompton-road	19,900	0	0
Carter, H. J., Grays	19,218	0	0
Hill, C. G., Coventry	18,880	0	0
Lorden and Son, Upper Tooting	18,489	0	0
Hearle and Farrow, London	18,125	0	0
Reed and Son, Stratford	17,996	0	0
Girling and Coe, Ipswich	17,841	0	0
Maddison, W. J., Canning Town	17,534	0	0
Gregar and Son, Stratford	17,320	0	0
Kirk, Knight and Co., Sleaford	17,100	0	0

(* Accepted.)

LADDERS, BARROWS, STEPS,
TRESTLES, SCAFFOLDING,
For Sale or Hire.

J. BATCHELAR & CO.,
48, HAMMERSMITH ROAD, W.

SHEFFIELD.—For additional court, magistrates' room, waiting-rooms, offices and cells, between Waingate and Castle Green, Sheffield, for the Watch Committee. Messrs. Flockton and Gibbs, architects, 15, St. James's-row, Sheffield:—

Whole Tenders.

Morton, J.	£16,917	0	0
Lowe, T., and Sons, Burton-on-Trent	16,800	0	0
Longden, G., and Son	16,200	0	0
Ives, F., Shipley	15,938	0	0
Ash, Son and Biggin	15,780	0	0

Accepted Tenders.

Fidler, J., Eckington, mason	£8,895	0	0
Lillevier, J. H., joiner	4,105	12	0
Corrie, J. B., and Sons, plumber	1,120	10	0
Carter, Bros. and Co., Manchester, ironfounder	788	0	0
Chadwick, C., and Son, plasterer and slater	375	0	0

COMPETITIONS.

NEW SCHOOLS, WHITWELL, CHESTERFIELD.

DESIGNS invited at once for complete Set of Schools (Boys', Girls', and Infants), with residences. Remuneration for successful competitor only. Applications for particulars to be sent in to the Secretary (GEORGE WALKER, Esq., Whitwell, Chesterfield), before April 8, 1895

ARCHITECTURAL COMPETITION.
ABERGAVENNY INTERMEDIATE SCHOOL FOR GIRLS.

The Managers of the above School are desirous of receiving from Architects, DESIGNS, SPECIFICATIONS, and ESTIMATES for the ERECTION, at a cost not exceeding £1,000 of DAY SCHOOL BUILDINGS, at Abergavenny, for the accommodation of 60 girls, planned with a view to convenient extension, the estimated cost not to include architect's fees or school furniture.

A plan of the site may be obtained on application to the Clerk on payment of One guinea, which sum will be returned on receipt of Bonâ-fide Designs.

The Managers do not bind themselves to carry out any plan submitted.

It is, however, intended that the architect whose plans are accepted by the Board be appointed Architect, provided that the Tenders approximate the estimates.

The Designs are to be sent to the Clerk under non-deplume, to be accompanied with the name and address of the competitor in sealed envelope, not later than THURSDAY, the 11th day of APRIL, 1895.

ABERGAVENNY, FRED. BAKER GABB, Clerk,
March, 1895.

TWICKENHAM.—For repairs and decorations to Poulett Lodge, Cross Depe, Twickenham, for Mr. P. B. Burgoyne. Mr. Walter J. Ebbetts, F.R.L.B.A., Savoy-house, 115, Strand, W.C., architect:—

Foord and Sons, Brentford (accepted)	£873	15	0
For internal sanitary works:—			
Foord and Sons, Brentford (accepted)	125	12	0
For external sanitary works:—			
Foord and Sons, Brentford (accepted)	191	0	0

Ashes—and Sackcloth. If it be true that the straw shows how the wind blows, then the Birmingham Corporation Water Department is in the position of the drowning man. We have mixed two old metaphors intentionally, because water has become a muddling business, and any Water Company or Corporation "going under" is a happy sight just now. A small property owner, named Thompson, sued the Water Department for £2 is., cost of renewing certain lead pipes laid by them to his order for the water supply of certain premises belonging to him in Small Heath. The pipes should have lasted (according to the rules laid down by Tradition) forty or fifty years, but, as a matter of fact, they "expired" when eighteen months old. There was a leakage so long ago as last June. Evidently the pipes were anticipating our recent severe winter. When the pipes were exposed, Thompson found that in order to comply with the requirements of the Department it would be necessary to relay the whole of them from the main to the stop-tap. The pipe had simply been put down in a road composed of ashes, and had corroded. A wise Water Company would have given the pipe a "coating" of some kind. And so this "case" in the County Court: Was plaintiff responsible for renewal or defendants liable for work improperly done? Of course the defence was that the pipes had been well and properly laid, and that the premature corrosion of the lead was due to the action of chemical constituents in the ashes which the Corporation officials could not know of. Corporations, in these matters, remind us of the lily white hen that never "laid astray." For the plaintiff, witnesses testified that lead pipes ought not to be laid in chemical ashes without protection. The Corporation called witnesses to prove that every precaution had been taken, that the road was not of their making, that they had no reason to suppose there was anything deleterious in the ashes. The Corporation officials admitted that pipes such as the plaintiff had ordered ought to last fifty years. There was no reason why they

should have deteriorated so rapidly, unless there were some noxious constituents in the ashes in which they were embedded. Judge Chalmers was not to be taken with chaff—or ashes. He remarked that the question was one of fact. Had the pipe been properly laid or not? There was a conflict of evidence on the part of the experts as to the effect of ordinary ashes, but it was admitted that chemical ashes were injurious, and the ashes

ENTRANCE TO HUMEWOOD, CO. WICKLOW: BY MR. JAMES BROOKS.

in this case were unquestionably chemical ashes, as the Water Department might and ought to have ascertained at the time. Under the circumstance he thought the Corporation were liable for the damage to the pipes, and a verdict must be given for the necessary repairs, which were estimated at 38s., and costs. We would suggest sackcloth and ashes as appropriate to the Birmingham Water Department just now.

John Jerry! OUR old friend Jerry still bears us company. At an inquest, in Wolverhampton, on the body of a boy who was killed last week by a chimney crashing through the roof of the house in which he resided, the borough surveyor mentioned that the gale on the previous Sunday had caused damage to the extent of £15,000 in the town. The jury, in returning a verdict, recommended the Corporation to prevent the erection and occupation of jerry-built houses. This recommendation by the twelve enlightened jurymen of Wolverhampton is a nasty joke for the Corporation, but imagine for a moment the need for such a thing! Perhaps the coroner forwarded the jury's suggestion in due course to the corporate body, and, perhaps the corporate body, steeped to the lips as it may be with jerry interests, turned up its nose at the jury, and pitched the recommendation into the fire. These silly verdicts of half-hearted jurymen are quite useless, and all the Building Acts and bye-laws in the land are powerless to stop imperfect work. It is quite easy to exterminate the genus Jerry; not by rules and exactions, not by bye-laws and borough surveyors, not by penalties and sanitary inspectors. Jerry-building can be stopped—not altogether, nor suddenly—by altering the tenure of land, and then Master John will no longer be able to commence a building estate on a capital of eighteenpence and a sparkling record of judgment summonses. It is idle to think that jerry-building is less practised in the country than it was five-and-twenty years ago. It is as rampant, as evident, as barefaced. It is smuggled in under "art" decorations, which to a sensitive soul makes the horror ten times worse. One thing, however, is refreshing to announce, that Master John Jerry has almost entirely shifted his abode from London. District surveyors are more conscientious than their brethren of the country. They are altogether a more able class of men, and there is no opportunity for them to get on a footing of acquaintance with their building visitors. But, in the country, matters are distinctly different, and Master Jerry is generally master of the Local Board Surveyor and half-a-dozen of the councillors, and a box of indifferent cigars will buy up all the

requirements of the Urban Sanitary authorities, much as a butcher buys up copies of *The Times* to wrap up his New Zealand mutton. But—and let us have a but in the case—the Leasehold Enfranchisement Association, who can count upon our strongest support, without, however, an atom of political feeling, will one day win, and then good-bye to our old friend. We fancy he is grey haired already.

Labour and Learning.

EVERY now and then there springs up a New Cult, and it is the habit of a Cult to demand a roof for its head. Nothing can be done, now-a-days, without a "Hall." This is good for the architect and builder, who, a little while ago, had begun to fear that all the big buildings had been built. But every town is to have its Toynbee Hall, and there will now be scope, as may be imagined, for some architecture and much ornamentation. The London Toynbee Hall workers are determined upon spreading their gospel throughout the country, and at present they are propagating their principles in Manchester and Liverpool, with much success. Canon Barnett, who is a Warden of Toynbeeism, and Sir John Gorst, who plays the rôle—and plays it very well—of Our Mutual Friend, have stormed Manchester and found that city willing. Owens College is eager, and Ancoats is the suggested "area" for settlement. Active Toynbee workers hold—and rightly hold, we think—that the day of dilettante interest from the superior suburbs has gone by. People must go to the poor if the poor have to be brought to the surface. And anyone at all conversant with Ancoats, Manchester, will know what this means. It means sacrifice, surrender, and self-denial. A Manchester contemporary asserts that to live in Ancoats is by several degrees less wholesome than to live in Whitechapel. We are not prepared to dispute that, though we have our doubts, but comparisons in "Whitechapels" are odorous as well as odious. The germ of the Toynbee idea is good; is honest; is an aspect of what may be termed—for want of a better definition—Christian Socialism. That dense populations should live together like swine, breathing the abominable air of courts and alleys, living amid surroundings that even contaminate children, growing up and growing old under conditions that diminish the vitality of the race, is the black blot upon our vaunted civilization. In no savagery in the World is such uncleanness. The object of these Toynbee Halls is to arouse a healthy—as distinguished from a merely political—discontent. We believe in the healthy discontent. It is the secret of advancement in Progress, in Commerce, in Science, Literature, and the Arts. What would our Architecture be to-day if it had not been for the healthy discontent of a few? University men and women settling down in Ancoats—or elsewhere—will introduce a little of the sweetness and light of life, will voice the *Vox Populi* better than either fanatics or faddists. Only they must be vigorous-brained, clear-seeing and large-hearted men and women. Sir John Gorst's description of the ideal Toynbee Hall as the meeting place of "learning and labour" is sound. Not to the political panaceas of the day, nor to the catch-penny schemes of picturesque propagandists, should Labour look for help while Learning stands despised. Labour still needs educating, needs learning, and we are not afraid, like some of our daily contemporaries, to say this. All thinking men—be they workers or employers—came to this conclusion long ago.

Does Honesty Pay?

A BIG issue seemed to be raised by a pathetic little incident last week. Big issues have a habit of springing from small begin-

nings, but the larger ethics we can well leave alone for the moment. A poorly-clad working woman picked up a small leather bag from the pavement in Long lane, Smithfield. She opened it and saw that it contained papers and gold—£500 in all. She did not get excited, nor did she spend any of the money. She simply told "some people" about it, and said she would take it to the police station. Presently the owner of the bag and its contents hurried up, alarmed at his loss; he described the cheques satisfactorily; he got his bag and his money. This man had a small "bump" of gratitude, and no soul. He could lose £500 without falling ill, but to part with five-shillings would have killed him. He rewarded the working woman with *one penny*! It was a gross piece of extravagance, but was not Honesty Rewarded? Fortunately the old school copy books say: *Honesty is its own reward.*

"IRON AND BRASS."

By MR. J. W. SINGER.

[Concluding Extracts from a Paper read before the Architectural Association.]

BRASS is very tenacious, but it has this defect, that if the tension is continued, a singular molecule change takes place, rendering it rotten and most unfitted to support any heavy weight. This fact was evidently known to the brass workers of the sixteenth and seventeenth century, for it will be noticed that they never used brass to suspend the large brass chandeliers made about that date, and so often seen in our churches, but invariably used iron rods. It has been said by an authority that every brass pendant hung by means of brass supports will drop within fifty years. This may be an exaggeration, but brass is not a suitable material for the support of any heavy object. Brass is the metal in which a very large proportion of what is known as objects of applied art are now produced, bronze being retained for fine art. And to bring it into suitable shapes, brass is cast, drawn into round wire, flat strips, hollow tubes, and rolled into sheets, and in these various forms easily lends itself to the manipulation of the workman. Now, just to refer to the long series of operations through which this metal passes in its many different modes of treatment. Thus in a molten state it is cast into suitable forms moulded in sand. The model from which the mould is made may be either carved in wood or modelled in clay. The castings, according to their shape and the object for which they are required, are either turned in a lathe, or are chased. Brass is also beaten into forms or embossed, bent into scrolls of various kinds, when in the shape of strip brass, and also there is the large sub-division of engraved work. Mention should also be made of the process known as spinning. The form of the object that is to be spun is first made in either hard wood, or if a great number of the article is required, it is made in metal. This form, which is termed a chuck, is put in a lathe, and against it is fixed a brass disc. The lathe is then put into rapid motion, and various steel tools of different shapes pressed with considerable force against the disc, beginning in the centre, and gradually working outwards as the metal yields to the pressure, and takes the form of the model. It is a very interesting process, and astonishing how quickly a good workman can spin a number of forms, which, if they had to be hammered up, would entail much time and labour. Brass is also used for repoussé work, and this process, is, perhaps, the one that requires the most highly skilled and artistic treatment of any through which the metal passes. It is not quite such a suitable metal for this pur-

pose as copper, as it is not so soft, and cannot be stretched so easily without cracking, but this method of execution has been, and is still, very generally employed for converting this metal into ornamental forms—the processional crosses on the table being interesting examples of the application of repoussé work. After brass has been treated in one or other of these processes, it is either polished or dipped in an acid solution and burnished, to give the metal its bright yellow colour, with which we are so well accustomed. As brass cannot be welded like iron, another mode of attaching the various parts of a piece of work has to be adopted, and, as may be imagined from the general use of this metal for the manufacture of ornamental forms, this process, which is known as soldering, is not a difficult one. The two surfaces are united by the application of sufficient heat to melt a more fusible and baser metal which is introduced between them, and which combines with both, and firmly unites the two parts. It will thus be seen that many industries throughout the country are the result of the many processes through which this metal passes, before it comes before us in the form of, say, a lectern, or an altar-cross for our church, a gas-bracket, or an electrolier to light our room, a door handle, or a fender; and, perhaps, no metal has a more universal application, as it is used for almost every form of ornament needed in metal for either ecclesiastical or domestic purposes. It is a question if it would not be desirable to make a larger use of bronze in preference to brass. I confess that for many purposes I consider the former the best metal. Thus, for work in churches, I think bronze the better material of the two. It is more durable, of a richer shade, and it retains its colour much better, as brass so easily tarnishes, on account of the zinc in its composition, and the difference between the cost of the two metals is really little; in fact, our firm is always willing to supply bronze at nearly the same price as may be quoted for brass. I believe in the future bronze will be much more generally used than it has been in the past. The application of brass to architecture is not quite so direct as in the case of iron; as brass, being cleaner to handle, and no doubt also because of its colour, and the facility of its manufacture, is more often used for movable pieces of furniture, such as lecterns, candlesticks, crosses, vases, and numerous articles in daily use. It is now recognised, however, that even a piece of furniture has its influence upon a building, and deserves and repays the architect's attention. It is admitted at the present day, however it may have been a few years ago, that it is hardly expedient to turn the architect out of the house as soon as the four walls are built. England is, perhaps, not so rich as some countries in examples of old brass work, but there is a certain dignity of style about such as we have—for instance, the old brasses and lecterns, which have been revived with some success.

IMPORTANT deposits of amianthus have been discovered in the Grand Cañon of Colorado, about 75 miles north of Flagstaff. Amianthus is a finer sort of asbestos. It splits into long, flexible whitish-grey filaments, hence it is sometimes called earth-flax. It can be woven into cloth or paper together with flax, which may afterwards be removed by heat. Amianthus is incombustible; it is used for lamp wicks and filling gas grates, where its fibres glow with the soft radiance of a clear coal fire without being consumed. The prevalent employment of gas stoves will create a greater demand for it in commerce.

THE new infants' Sunday School buildings attached to Burlington Chapel, Ipswich, which have cost £1,400, were opened last week. Messrs. Eade & Johns, of Ipswich, were the architects, and Mr. Edgar Catchpole, of the same town, was the contractor.

"ON FIRE!"

A CHAT WITH MR. EDWIN O. SACHS.

THE recent controversy on concrete and its resistance—or otherwise—to fire, suggested that Mr. Sachs, who has been a practical fireman on the Continent, would be a likely man for ideas. When we had talked for half-an-hour there seemed to be more ideas than we knew what to do with, but this was, of course, Mr. Sachs' fault. He was just back from the Continent, and the

Continent is to the architect what fresh air is to the ordinary individual. So that I digged in fertile soil.

A lofty office—architects dwell so near the gods!—in Waterloo Place revealed Edwin Sachs—who is still a young man with a fear of worse—behind a green baize door. He was prepared, by document, and pamphlet and paper, to prove that he knew something about fire, but I waived these for the moment and attacked him in his early years. He has a boyish look still, although he asserts that three thousand and odd fires have shortened his life—burning the candle at both ends.

"Oh, I am an Englishman" (and I think his portrait proves it), "and was born in London; educated (after a respectable lapse of years) at University College. Then I went to Germany, where I studied architecture and had a practical training, being a Government pupil engaged upon the edifice designed for the Imperial Law Courts. I gained further experience in the Berlin Royal Technical Schools. Then I was with Messrs. Ende and Boeckmann, of Berlin, who were the architects for the Japanese Imperial Parliament Houses in Tokio. Oh? Yes, I came into close contact with the Japs and found them remarkably clever fellows; quick to learn and persistently persevering. An odd thing about the Jap is his adaptability. In Germany, he is a German; in England, an Englishman."

"Tell me the best continental country for the architectural student?"

"Well, I should say in the following order, and I know well the whole of Central and Northern Europe:—South Germany, North France, Cairo, and Russia. I have not been to Spain. In South Germany the student will pick up hints for Renaissance; in North France, here and there little Gothic suggestions that may happen to be practical and inexpensive; while in Egypt and Russia he will gain an idea of colour. No one can comprehend the effect of colour in architecture, unless he has been to Egypt or the East."

"Of yourself as fireman?"

"I became a 'ranker' under the German Home Office, in the Royal Police Fire

Brigade, Berlin, ultimately obtaining an Ensign's commission and serving one year. For six weeks at a time I never had my boots off. It was terribly hard work, but the practical experience was invaluable; I attended three thousand fires. The Berlin fire system is one based upon absolute theory. It is all theory, and I think theory can go too far. I divide fire Protection under three heads: Fire Prevention, Fire Combating and Fire Research. In matters of research, the Germans are first-rate, but in combating their firemen lack ready resource. It is not always possible to work on a scientific basis, and then is the time for a little happy-go-lucky rule of thumb. After I had ended my connection with the Berlin brigade, I went to Vienna and became a supernumerary officer in the fire brigade of that city. The Viennese system seems to me the nearest perfection. It is a good half-way house between absolute theory and happy-go-lucky practice."

"Take London. In London there is very little theory and much 'practice.' Even the New Building Act does not mark any great advancement; there is not enough division of risks—partitioning—and huge blocks are intermingled. Little is attempted in the way of fire prevention. In 'combating' there is a serious deficiency in fire alarms, nor can sufficient men be concentrated in a short space of time upon any given spot. For instance, the 'first batch' on the spot, in Berlin, numbers 28 men; in London, only four men. More stations! More men! is my cry. Why, that great authority, Sir E. M. Shaw complained so long ago as 1872 of an insufficiency of men, and we have to-day one hundred less than he suggested as necessary. Berlin—and remember how much smaller the City—has 800. No, I do not believe in kid-glove volunteers, but I think that a trained Reserve Force would be valuable, inasmuch that it would be there to fall back upon. These

galleries, wide passages, straight stairs and unimpeded exits are sure guarantees for safety, of whatever material composed. Protection of property is another matter. Perhaps a theatre manager might not thank you for saving his theatre! And then this question of concrete. Concrete, grown hot, becomes brittle and breaks, while wrought iron columns collapse. Look at this photograph showing the effect of a recent fire at Hamburg. You will see that one section of the wrought iron stanchion has simply crumpled up, letting the floor of the gallery down. A cast iron column would not have done that. Wrought iron, so far from being a source of strength in case of fire, is in reality a source of weakness. It helps to drag the concrete down."

"And why are our theatres so small, compared to those upon the Continent?"

"A simple answer. The theatre abroad is the assembly hall, the reception room, and the playhouse in one. There, men go to meet each other, take their friends, fraternise, pass round the gossip of the town. In England, the theatre is an accessory—abroad, a necessity. I would not go to the length of advocating state-provided theatres in England, but I think municipal subscription theatres would be appreciated, with stock companies and regular organisation. The difficulty would be to get public spirited men to endow them."

And then we fell upon controversy, for I had my doubts of the monied men "founding" theatres—save as a commercial investment. And from this we drifted to discuss other matters, Mr. Sachs bringing forth a batch of drawings intended for the handsome volumes he is preparing, in conjunction with Mr. Ernest Woodrow, A.R.I.B.A., dealing with "Modern Opera Houses and Theatres." Mr. Sachs is one of the Foreign Secretaries of the National Fire Brigades Union, and has just been appointed statistical officer on theatre fires

COLLAPSE OF A WROUGHT IRON STANCHION.

Reserves should, of course, live near the stations of call."

"But the men?"

"Oh, Englishmen! and English fire appliances too. Our engines are absolutely the best in the World. Then, with regard to fires in theatres: do you know it is quite possible to have a perfectly 'safe' theatre, so far as immunity from loss of life is concerned, with wood galleries and floors; wide, straight

to the German authorities. It may interest the Insurance Companies to know that particulars of 11,000 fires have already been collected, and herein should be much wisdom. Fire is a subject that Mr. Sachs has also handled in certain flame-coloured pamphlets.

Mr. Sachs, in spite of his experience, is quite willing to build theatres for those that want them. This may read like something of a riddle, but it is only a business paradox.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
2nd April, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

In any respectable dictionary, but more especially in Webster's, a conservatory is defined as a "green-house for exotics often attached to a dwelling-house as an ornament." From their contention in the City of London Court, the East London Water Company appear to consider this definition lacking in elasticity. As a matter of principle only—for in the particular case they had, "out of grace," ceased to levy the assessment—the company were ready to argue that a small glazed lobby leading to the smoking room of a suburban villa and decorated with a few despondent plants in pots, was liable to an extra water rate of 5s. as a "conservatory." It was true the lobby was entirely innocent of a water supply. But when a London water company has a principle to maintain, and begins to draw on its reserves of statutory authority, the hapless ratepayer might as well climb down or sit as desolate as a greenhouse geranium. Presently the companies will charge—like the barbers—for a shampoo.

ALREADY the National Gallery of British Art, which is in course of construction upon the site of the old Millbank Penitentiary, promises to be one of the finest buildings upon the banks of the Thames. Impeded by the recent frost, the workmen had to abandon their tasks for an appreciable period, but, in spite of this, it is confidently believed that the undertaking will be carried out within the contract period; and in a few months there will be completed one of the largest and best-appointed buildings in the kingdom devoted entirely to British art. Something like a burden will be lifted from the shoulders of the trustees of the National Gallery in Trafalgar Square, which has now for several years been so overcrowded with pictures as to render it impossible to expose them all to public view, even with the use of the much-abused screens. The architecture of the new structure is massive, but without that dull and unimposing solidity which characterises the older institution; and, in addition to the fact that the new gallery overlooks the river, there are to be no buildings attached directly to it on either side, so that an uninterrupted view of the architectural decorations can be obtained on three sides of the site. The chief piece of decorative work within the gallery will be in the large octagonal entrance hall, from which the picture-rooms will be approached.

TECHNICAL education and instruction are making headway. Darlington finds its old school not big enough, and it proposes to borrow £8,000 for the purpose of a new technical instruction building. The total cost will be from £15,000 to £16,000, but

there will be a contribution from the Durham County Council of £2,250, and from the South Kensington grant £1,000, while subscriptions are promised of £1,095. There is in addition a surplus from a penny rate for technical instruction which has been levied for three years.

THE report upon the series of explosions which occurred on Southwark Bridge, on February 1st, has been issued by Major Cardew, electrical inspector to the Board of Trade. In these outbreaks it appears to be uncertain whether the gas was fired by electricity or by the introduction of a match which might have been thrown down by a passer-by, and Major Cardew reports that the most striking features of the accident are: (1) The distance to which it appears that a series of explosions may travel along the electric mains, which form a gigantic network under the whole of the streets of the City; and (2) the proof afforded of the insufficiency of any ordinary system of ventilation of the pipes and electric street-boxes, if gas can find an easy access to them. The inspector urges the Board of Trade to call upon the City of London Electric Lighting Company to take the necessary precautions required by the Board.

ALREADY Paris is busying herself with the forthcoming Universal Exhibition. M. Alexandre Dumas fils, M. Sardou, and M. Jules Claretie, manager of the Comédie Française, have met to discuss theatrical plans. It is proposed to construct a play-house as near the Champs Elysées as possible, for representations to be given by French or foreign companies. Side theatres will also probably be erected at different points of the Exhibition, chiefly for historic revivals or reproductions, but no definite resolutions were arrived at, only preliminary arrangements being sketched out by the directors, who will hereafter come to a decision on the subjects discussed. The organisers of the Exhibition also intend to concert measures for the maintenance of the *status quo* as regards the Palais de l'Industrie during the progress of the works. The artists and sculptors were afraid that they were about to be ousted from that construction, but it is possible that the annual Salon of the Champs Elysées, as well as the minor and incidental exhibitions of the year, will continue to be held as usual in the Palais de l'Industrie.

CANON AINGER will shortly make his advent to the Master's House in the Temple, the preparation of which has been in progress for four months and is still going on, the expense being borne by the Middle Temple. The improvements include a new system of drainage, and the fine old house has been taken in hand from top to bottom. Canon Ainger, whom all lovers of Charles Lamb have cause to admire, will find it no easy task to succeed so eminent a Master of the Temple as Dr. Vaughan, but he is very popular with the bar.

ARCHITECTURALLY the houses in Armenia are extremely simple; four stone walls are built above the surface of the ground and are covered over with a flat roof of earth, which is rolled until it becomes rain-proof. On this roof they hang their clothes to dry, walk about in fine weather when the streets are changed into morasses, turn out their children to play, and spread their shakedown for the entire family in hot weather. The floors of the rooms are likewise of hardened earth, on which all the inmates of the house enjoy sleep. The more affluent peasants have a plain wooden divan, on which, when it is covered with rugs and carpets, they pass their long winter nights. In Dalori, or Dalvori, which played a very important yet

absolutely passive rôle in the recent butchery, in Psank, Berm, and some other places, the houses differ from those of the rest of Sassoon, and are in all respects identical with the dwellings of the Kurds. Thus they have two stories instead of one, the upper half being termed *Keshk* (a Turkish word). The *Keshk* has very large windows in each of the four walls; but, for pressing purposes of defence, under each window lies a pile of big cut stones, specially prepared for blocking up the aperture so completely that only two or three narrow openings are left through which the flint-lock may empty its contents with effect.

THE spring exhibition at the Walker Art Gallery, Liverpool, has novelty. A considerable amount of space is devoted to works in black and white and architectural designs, and various branches of decorative art are illustrated more or less adequately. Nearly four hundred water-colour drawings occupy two of the rooms; and among the remaining exhibits are some oil paintings and photographs. Nearly all the leading illustrators are represented in the black and white room, among the contributors being Sir John Gilbert, Mr. Phil May, Mr. Greiffenhagen, Mr. Raven Hill, Mr. Pennell, and Mr. R. Anning Bell.

THE description of the discoveries made at Pompeii during the recent excavations, has been published. It shows that enormous buildings have been unearthed, of great beauty and solidity in architecture, with perfect drainage, and with the fullest provisions for health and comfort. The buildings contain thirty or forty immensely spacious apartments on the first floor, and as many on the second. The rooms looked out on a rotunda nearly forty feet long. Courts, surrounded by columns, surrounded the bedrooms, which opened upon large ornamental gardens with fountains. Suites of rooms were built upon the flat plan of modern times, while the ventilating machinery was in every way perfect. One of the most interesting discoveries made was that of a bathroom, which was unearthed on a property belonging to Signor de Proseo. This bathroom was furnished with large sculptured marble basins, heating apparatus, lead plumbing work, with bronze faucets, and tiled floors and walls. It was arranged with the usual hot, tepid and cold sections. It has been so well preserved because the roof did not cave in during the great eruption of Vesuvius which buried the city of Pompeii in the year 79. Most of the houses were entirely destroyed at that time, only a few vaulted structures resisting the immense pressure of the lava and ashes.

At the recent Sheffield Art Crafts Exhibition, a piece of repoussé work, in the form of a shield adapted for billiard tournaments, caused much admiration. It consisted of a polished oak back, with sterling silver and electro gilded and oxidized mountings. The centre of the shield was an oxidized plaque, showing billiard players at play, with the accustomed raised seats containing a few spectators, interested more or less in the match. A plaque in the centre was set in a gilded mount, composed of oak leaves in the form of a wreath, and in bold relief at the top of the shield was a coloured ribbon and band to bear the name of the club. Round the sides of the shield were eleven sterling silver medallions to carry the names of the winners in the different tournaments. The work was designed by Mr. T. Swaffield Brown, of Messrs. William Hutton & Sons.

THE last lecture of the series on Cathedrals was given at Toynbee Hall by the Rev. Vicars Boyle. No English cathedral, he said, approached Lichfield in the rich magni-

fience of its West Front, which we owed to Bishop Roger Longepée, a foreigner who could not speak English, and who was an absentee for many years. The lovely doorways and the grouping of the three graceful spires gave to Lichfield a distinctive beauty. Its library contained unique treasures, among them the gospels of St. Chad.

THE National Portrait Gallery, which has been built from designs by the late Mr. Ewan Christian at the back of the National Gallery, is now completed and furnished, but will not, it is stated, be handed over to the Government until the end of next month, as a large hoist lift is in process of erection. The building is an adaptation of the Florentine style of the sixteenth century. Mr. Alexander, the original donor, has contributed £80,000 towards the total cost of £96,000, and the Government the remainder. After the pictures have been moved in, there will be a public opening ceremony.

A PASSAGE in the speech by Sir Edward Clarke, Ex-solicitor General, on the "Welsh Disestablishment Bill," is worth reading. "Take the cathedral of Llandaff," he said. "Forty years ago that cathedral was practically a ruin. The nave was grass-grown, the ivy climbed, and birds built their nests in its roofless and windowless walls, and at the end of it there was a small choir, shut in by an imitation Italian facade. There was a scanty congregation, a poor and meagre service, and a choir in which no anthem had been sung for 200 years. What is the state of things now? During those forty years that church has gained beauty and strength, and it is now one of the finest of Christian temples in Wales. There is a spacious nave, the church furniture is of the best, but the best furniture there is in the men who are ministering the work of the Church and the great congregations that come in to join in the service of prayer and praise. That is a Church that is to be taken away, as if it was not a national monument, and the Church in Wales is to be told that it has no Cathedral of its own, but is, by permission of three Welsh Commissioners, merely to be allowed to celebrate service there."

THE Exhibition of the Royal Society of British Artists is less interesting than even a moderate enthusiasm would have led us to expect. Several of the most able members of the Society contribute nothing. Others are fairly well represented, and there are a few good works by artists who have not yet acquired any wide reputation. Mr. Bertram Priestman has a large picture of dismantled ships under a stormy sunset sky: "Condemned"; and M. Julius Olsson shows an advance on his previous work, in a delicately-toned and exquisite sea coast view, "The Waning Moon." Turning to more architectural subjects, an interior of "Chartres Cathedral," by the President, Mr. Wyke Bayliss, has all the distinguishing qualities of his work; but the smaller view, "In the Church of St. Lorenz, Nuremberg," while quite as accurate in design, is broader in style, and more impressive. The Exhibition is, on the whole, disappointing.

It is to be feared that the injuries done to the noblest ruin in the World by the recent

earthquakes in Greece are more serious than was at first supposed. The Parthenon, it is stated, is in great danger, and it may have to be handed over to the tender mercies of the "restorer." No monument of antiquity is at once so beautiful and so dignified as the great temple on the Acropolis of Athens, which, in spite of the storms of centuries and the more cruel devastations of successive wars, still gives a more adequate idea of the wonderful creative powers of the Greek architects than any other existing building. It is satisfactory, however, to know that nothing will be done without the gravest consideration. A careful investigation undertaken by a commission of inquiry which included several distinguished foreign architects has made it clear that extensive repairs are absolutely necessary to prevent the destruction of the western portico, but the Greek Government have summoned Professor Durm, of Karlsruhe, to make a further examination and

to be offered to the proposal, which, on the other hand, has the support of the teetotalers and the purity party. It is contended that the provision is absurd, would be impracticable and harassing, and would not improve the morality and decorum of the town, but would interfere with the liberty and enjoyment of the summer visitors. The promoters of the clause claim it would have a tendency to enhance the order of Douglas as a watering-place. There is to be a strong fight over the proposal, which is developing an agitation in the town. The public "palaces" with which Douglas abounds would certainly suffer under this provision—particularly in the pecuniary sense.

A poll of the Trustees of the Royal Infirmary, Manchester, has resulted in a confirmation of the decision taken at the special meeting in February, when the plan for extending the Infirmary laterally towards Portland-street and Mosley-street was rejected. Even in the

face of the strongly expressed opinion of the Board of Management, it was scarcely possible that the Trustees should accept this plan after passing, in 1892, a resolution adverse to any scheme of extension which, like this one, would encroach on the open space now surrounding the building. Now that the extension scheme is disposed of, it may be expected that the alternative of retaining the present building as a central hospital and supplementing its accommodation by the use of additional buildings in the suburbs will be pushed to the front. An argument in favour of this course is to be found in the straightforward answer of Messrs. Young & Hall to an invitation to send in plans for the extension of the present building. "We are forced to the conclusion," these architects wrote, "that under no circumstances should the required accommodation be given upon the present site by adding to the present buildings. Upon public grounds also, we are strongly of opinion that the space which exists around the Infirmary buildings should be preserved for the good of the patients and the public considering the crowded condition of the city. The alternative is to pull down the entire buildings, except the out-patients' department and the nurses' home, and to erect an entirely new hospital, upon the present site. If this were done the same number of beds could not possibly be accommodated as now are." The main question now is—whether it is

better to persist in the hope of providing on the present central site all the accommodation that will be required for a great number of years, or to admit that the only way out of the difficulty is by decentralising the Infirmary, using the present building for such purposes as it will serve without much alteration of its fabric, and seeking further from the centre of the city the new and needed accommodation.

It is asserted in a Munich paper that a second Hymn to Apollo, twenty-eight lines in length, and with musical noting, has been discovered in Greece. It is engraved upon a marble tablet, and celebrates the birth of Apollo, the origin of the City of Delos, the arrival of Apollo in Delphi, his victory over the serpent, and ends with a prayer for Greece. The notes of this new Pæan were found upon a neighbouring fragment of marble.

AN ENTRANCE TO THE PALACE, SHAFTESBURY CIRCUS.

MR. T. COLLCUTT, ARCHT.

give a definite opinion. Repairs to some of the other buildings on the Acropolis are said to be necessary, but none of them are so urgent as those imperatively demanded at the Parthenon. As the famous temple is less the property of the Greek nation than of the entire civilised world, a general appeal to the lovers of Greek art of every nation in aid of funds to secure the safety of the building will be made. The lowest estimate for the repairs that are indispensable is £40,000.

THE proposal of the Douglas Town Commissioners to introduce into the bill for regulating and licensing places of amusement a provision for closing at half-past ten all places of entertainment, except theatres, is provoking strong opposition from licensed victuallers and those interested in the Palace, Derby Castle, Falcon Cliff, and other places of amusement. A determined opposition is

ON the first stone of the monument to Garibaldi, laid the other day at Rome, in presence of the King, was sculptured the effigy of Garibaldi, and inscribed in red letters the words: "First stone, March, 1895, monument to Garibaldi." The parchment walled in with the stone is a fine piece of illuminated work, adorned at the four corners with the coats of arms of Savoy, Rome, Nice, and Sicily and Naples. The inscription runs as follows: "Born 4th July, 1807," then in Gothic letters: "In perpetual memory. On the 19th March, 1895, Humbert I., King of Italy—when Francesco Crispi was Prime Minister—placed the first stone of the monument which the Italians, having been restored to liberty, determined to erect in the eternal city of Rome to Guiseppe Garibaldi." Below is the date of the hero's death: "2nd June, 1882."

THE Barrow Steel Company have lately been prospecting for iron ore at the Park Mines, five miles from Barrow, with the result that a most valuable deposit of rich hematite ore has been discovered. An analysis shows the ore to be of 58 per cent. metallic strength, with only 8 per cent. of insoluble residue or silica. The great advantage of this find is that the Barrow Steel Company, as owner of the mine, can secure deliveries of the very highest quality of metal at their works at Barrow at about 8s. per ton, compared with 13s. 6d. per ton, which is the present value of Hodbarrow metal. As nearly two tons of ore are required to make one ton of pig iron, this will give the Barrow Company an advantage in the market of about 10s. a ton. The Duke of Devonshire is the royalty owner, and no higher royalty will be paid on this new ore than on commoner ores which are raised. At a time when so much competition is experienced owing to great importation of Spanish ores, this find is of extreme importance to Furness, and will help to place the native hematite district in a position to hold its own against all comers.

A STATEMENT of proposed naval works at harbours and dockyards, drawn up by the Admiralty, has been issued. For the enclosure and defence of harbours against torpedo attack, in addition to £373,000 already sanctioned by Parliament at Gibraltar, it is now proposed to spend £681,000 more on the detached mole and in deepening the harbour there, £650,000 on Portland breakwater, and £1,920,000 on Dover breakwater. For adapting naval ports to the present needs of the fleet, in addition to £3,375,000 already sanctioned at various ports, £290,000 is proposed to be spent on Hong Kong dockyard extension. For naval barracks it is proposed to spend £595,000 at Portsmouth, in addition to £397,000 already sanctioned at Chatham, Walmer, and Keyham; and for superintendence and miscellaneous charges a further outlay of £179,000 is proposed, in addition to £121,000 already spent. The new works proposed amount to £4,315,000, making, with the amount of the works already sanctioned, a total of £8,581,000.

YET another exhibition! Arrangements for the display of old clocks, at the Royal Aquarium during May and June, are making satisfactory progress. Mr. Ritchie, the managing director, has obtained promises of the loan of a number of curiosities, but, wishing to make the display as varied as possible, he is asking all the possessors of clocks and watches of historical or other interest, to allow them to be placed on view at Westminster. We may shortly anticipate an efflorescence of "art" clocks keeping time with "art" furniture. This may be the only "time" they will ever keep!

THE collapse of the well-known tunnel under St. Catherine's, just outside Guildford, on the South-Western line from Woking to Portsmouth, appeared to be due to the frost, and to have occurred when the ice melted. The hill through which the tunnel runs is of sand, and not of chalk, like the greater part of the adjoining ridge, and, with its ancient chapel, a relic of the times when pilgrimages were made past it from the west country to Canterbury Cathedral, is a landmark for miles. Something like a thousand tons of sand and a coach-house and stables buried an engine and train, which was luckily empty, and the driver, fireman and guard, were fortunate enough to escape with their lives, though not without injury. Some time must elapse before the tunnel can be cleared, and passengers will for the present have to pass round the block by vehicles. Fortunately, there is an alternative route to the south coast, so the inconvenience will not be so great as it otherwise would have been.

A SCHEME has been set on foot by the rector of North Meols, near Southport, for the erection of a church midway between St. Cuthbert's, Churchtown, and All Saint's, Southport. It has been found impracticable to extend or rebuild the old Church of St. Cuthbert's, while the new Church of St. Simon and Jude is deemed unsafe owing to the moss land. It is considered that a new church in another part of the district would best meet the wants of the growing population. Mrs. Hesketh, the widow of the Rev. C. Hesketh, the lady of the manor, has given the site and promised £2,000 to the building fund. Over £5,000 and a site have been promised, including £1,000 from the Mayor of Southport, who is a Wesleyan. A liberal act like this speaks for itself.

PARISIANS have latterly been rather anxious about the condition of one of the most notable landmarks of their city—the Arc de Triomphe. Fragments of stone commenced to fall from the upper part of the arch, and a committee of architects was commissioned to see what was the matter. It was not until the structure had been half enveloped in scaffolding, and the minutest examination made, that the architects were able to give a satisfactory report. They find that the condition of the arch is not as grave as was at first feared. There is not the least danger of its total collapse, but it is deemed necessary to provide against further fragments becoming detached. The repairs will be mainly on the surface.

THE long-mooted scheme for constructing a canal connecting Lake Superior with the Atlantic is again being brought to the front, and if the necessary permission can be obtained, a company is to be formed to carry it out. The canal can only be made by the co-operation of the Canadian and United States Governments, and, should it be done, it will revolutionise American commerce. Chicago will be made a seaport, and the Far West will be placed in direct communication with the World. It is estimated that the canal will cost at least thirty million pounds.

RECENTLY a meeting of the committee of the Carlyle House Purchase Fund, which has been formed for the purpose of purchasing the Chelsea Sage's residence in Cheyne-Row, was held at Dr. Garnett's residence, British Museum. The gathering was private, but the business consisted of deciding whether subscriptions should still be asked for to clear up the deficit which exists of £400. Much of the money already contributed to the fund has come from America—yet another illustration of the apathy of England to the relics and residences of her great men!

A SCHEME involving the construction of an entire new railway between the English and French capitals in time for the next Paris Exhibition in 1900, and involving a capital of over £33,000,000 sterling, is, to put it mildly, rather a staggerer to the average imagination. The London and Paris Railway, the very sanguine prospectus says, would convey passengers, mails, and certain descriptions of goods between London and Paris in four hours and a half. Next!

NOR the least of the items which will figure in the Votes that are to come before the House of Commons later in the Session, is a sum of about £30,000 on account of the proposed addition to Westminster Abbey. Little has been heard of this scheme of late, but it has nevertheless been making steady progress. The Office of Works have got rid of all the tenants in the houses to be demolished but two, and an arrangement with these it is expected will shortly be made. It will then be possible to proceed at once with the clearing of the site, in order that the way may be paved for the decision of the larger question of the character of the addition which it is advisable to make to the Abbey. This is a matter which will be left for final decision by some specially appointed body, probably a Select Committee of the House of Commons. Meanwhile it is anticipated that there will be no difficulty in securing the assent of the House to the expenditure already incurred, as well as of a sum which it is anticipated will be required for the purchase of a house not included in the original list of buildings marked for demolition, which obscures the view of the Chapter House, and, generally speaking, interferes with the completeness of the work in hand.

THE "Art of William Holman Hunt" was the subject of a recent lecture delivered by Mr. Whitworth Wallis, of the Birmingham Museum and Art Gallery, at the Royal Institution, Manchester. After travelling the well-trod battle field of the pre-Raphaelite Brotherhood, Mr. Wallis spoke of Holman Hunt's early struggle for admission to the Academy schools. He failed, tried again, and his drawings were rejected. Then his father spoke seriously to him, said he was wasting his time; but young Hunt said he would try once more, and did so, this time successfully. He was then seventeen. Then commenced his friendship with Millais and Rossetti, the finding of the book of engravings, and the starting of the pre-Raphaelite movement. Mr. Wallis described each of Mr. Hunt's principal works as they had been produced, commencing with the "Rienzi," incidentally remarking that Dante Gabriel Rossetti sat for Rienzi, and Mr. Stephens assured him it was the best portrait executed of the poet-painter at that time. In speaking of the "Christian Missionary" and the "Two Gentlemen of Verona," Mr. Wallis referred to the ignorant and vulgar abuse showered upon the pre-Raphaelites at that time, but he truly said that not a word was remembered now, whilst the pictures so abused were now famous, and the artists amongst the greatest of the age. Of all the English pre-Raphaelite painters, Mr. Hunt had remained the most consistent, the most exclusive in his aims and methods. No artist who had ever lived had been so painfully and so thoroughly conscientious as Mr. Hunt. Every picture had been painted with the utmost of the artist's strength and the keenest of his emotions.

THAT inevitable Mr. Whistler, of whom some people are getting a little wearied, challenged Mr. George Moore, author and art critic, to a duel; presumably in return for Mr. Moore's having done his best to make the British Public appreciate Mr.

Whistler's pictures. Mr. Moore took no notice of the challenge, and now Mr. Whistler crows and chuckles and calls him a "runaway." It imperturbability *can* run away from hysteria, then Mr. Whistler has doubtless gained a bloodless victory, and may strut the Paris boulevards like one of his own peacocks. But the duel had been fought and won, and without any running away at all, common sense having triumphed. Mr. Whistler can hardly be expected to understand such a victory. But he has done what he could to restore a Parisian reputation that was a little clouded by the commercial spirit shown in the transactions over Lady Eden's portrait.

THE great merit of the collection of pottery presented to Weston Museum, Sheffield, by Dr. R. S. Marsden, formerly of that town, lies in the circumstance that it illustrates the manufacture of pottery in Britain in chronological order. It will probably be removed to Sheffield soon after Easter. There are between 200 and 250 specimens, including important and characteristic examples of the following wares:—(1) Dwight's Fulham stoneware, (2) old slip or Toft ware, (3) salt glaze or Crouch ware, (4) Old Delft (Lambeth, Bristol, Staffordshire, and Liverpool), (5) Wheildon ware (tortoise shell, agate and melon), (6) Wedgwood ware (50 examples), (7) Staffordshire figures, and other early examples, (8) Leeds ware, (9) Liverpool pointed ware, (10) early lustred ware, and other specimens, such as Rockingham, Davenport, &c.

THE committee of the Walsall Hospital have had a meeting to consider the necessary rebuilding of the hospital, damaged in the wind storm of a week ago. It is conjectured the cost will not be less than £1,500. The committee considered that by temporarily converting the committee room and two recreation rooms into wards the difficulty might be tided over, and provision made for thirty patients. The intrepidity and coolness of the nursing staff and servants, under the trying circumstances in which they were placed, also met with a warm acknowledgment.

MR. HENRY TATE, in making his gift to the nation of the principal pictures of his collection, and in building a gallery in which they might be housed, stipulated that the new gallery, whilst affiliated to the National Gallery, should have its own Board of Directors. Mr. Tate has, upon further consideration, resolved to hand the gallery and its contents absolutely over to the nation. It will, therefore, be entirely under the control of the Directors and Trustees of the National Gallery. A communication to this effect has been made to the Trustees.

THE west front of Peterborough Cathedral is so well known for its beauty and unique character that its condition can hardly fail to be a matter of widespread interest throughout the country, writes the Dean of Peterborough to the daily press. Many will, no doubt, regret to learn that it suffered very severely during the recent wind storm. Four of the pinnacles have been injured or destroyed, and it is feared that many other parts of the façade have been seriously shaken. The full extent of the damage cannot be ascertained until Mr. J. L. Pearson, R.A., has made his examination, but from a preliminary inspection which has been made by Mr. John Thompson, a builder, it is manifest that a considerable expenditure is immediately necessary to secure the safety of the west front. The gables of the north and south transepts and part of the Eastern Chapel have been for some time pronounced by Mr. Pearson to be in an unsafe condition. The Dean makes an urgent appeal for funds. Peterborough had fallen into a deplorable

condition a few years ago, and the work of renovation must necessarily be both costly and complete.

BEFORE the Improvement Committee of the Liverpool Corporation, Mr. W. H. Picton brought forward the plan of Mr. Henry Sumner, architect, for the improvement of the city, by the construction of direct high-level approaches from London Road and Lime Street to the Pierhead by means of viaducts parallel with the existing routes respectively of St. John's Lane and William Brown Street, passing over the Old Haymarket, and meeting near the juncture of Dale Street and Manchester Street. The scheme involves the clearing away of the large block of property between Manchester Street and Dale Street, the greater part of which, however, consists of Corporation leaseholds. Mr. Picton explained the scheme at length, and showed that it afforded possibilities for an unrivalled and greatly needed public improvement, with the provision of

A CORNER IN THE PALACE: MR. T. COLLCUTT, ARCHITECT.

a commanding site for public buildings. The City Engineer has to report on the suggested improvement.

THE great German Canal between the Baltic and the North Sea, now completed, will affect nearly all commerce with the Baltic, and especially our own. In plain terms, it cuts off the sharp and dangerous corner of the navigation by the Sound, which not only entails a great waste of time, but involves all sorts of difficulties both in peace and war. The Baltic is almost a landlocked sea, and this canal gives it another outlet. Hitherto, the only practicable means of access to it was by way of the Danish coast, and in easily conceivable circumstances, this one might have been blocked by an alliance between the Northern Powers. It is this consideration which has urged Germany to spend eight years, and nearly 7½ millions sterling in constructing the new waterway. The work is primarily a military one in its

inception and purposes, yet peace will gather the fulness of its harvest of benefits. The military advantages are certainly incontestable. Germany has the great port of Kiel on the Baltic, and she commands the mouth of the Elbe on the other side. Between the two lies this broad passage, and now the largest men-of-war can be floated with ease from sea to sea, without the slightest reference to the good pleasure of any other Power whatsoever. The proportions of the canal are majestic. It is 64 miles long; it has a width of nearly 65 yards at the top, and of 24 at the bottom, with a depth of over 9 yards; and it will take a man-of-war and a merchantman side by side. When two large warships have to pass, one must give the other the "pass" in a siding. It crosses four railways and five high roads. It will be open day and night and all the year round, summer and winter for it is believed that the warmer sea stream will keep it free from ice except in seasons of unusual severity. Ships will, of course, have to pay a toll, but the toll has been calculated on the basis of the saving they will effect by using the shorter passage. To meet the threatened competition, Copenhagen has been declared a free port. Vessels which might otherwise take the shorter route may therefore still be tempted to take the longer one when money is of more importance than time. The gain in distance ranges from 106 to 424 miles (from nearly all the English ports, as distinct from those of Scotland, and from 6 to 44 hours, or for sailing vessels as much as three days.

ST. SAVIOUR'S, Southwark, having adopted the Public Baths and Washhouses Act, the Commissioners have erected, at the cost of £40,000, buildings in Lavington Street, on a very complete scale. They consist of hot and cold first and second-class private baths, a handsome first class swimming bath, with a clear water space 100 ft. long and 30 ft. wide, and a cheerful second-class swimming bath slightly smaller. The accommodation is in all respects excellent, and the latest improvements have been carried out in the lighting, warming, and sanitary arrangements. In winter the largest bath can be converted into a spacious hall for public meetings. The establishment will be a boon, not only to the Metropolitan Brigade firemen, the police, and postal workers engaged in the neighbourhood, but also to City clerks and to Board-school children.

A MEETING of the Chester Town Council was held on Wednesday afternoon, when it was resolved to purchase the Dee Flour Mills. The purchase price is stated to be £7,000, and will include the weir and the water rights which are associated with the mills. The Council has for some time past had under consideration the prevention of the pollution of the Dee; and if they eventually decide to place sluice gates at the Old Bridge, the purchasing of the mills, it is believed, will greatly assist them in the scheme.

THE new Avon Street United Presbyterian Church is to replace the present one, which was erected in 1779 in connection with the Burgher sect, which eventually became part of the United Presbyterian body. Mr. J. B. Wilson, Glasgow, is the architect.

THE memorial of the late Frank Holl, R.A., the work of Mr. Gilbert, has been fixed in the crypt of St. Paul's Cathedral. Mr. William Agnew, who acted as secretary and treasurer of the fund, is making arrangements for a public ceremonial, which will take place in the cathedral shortly after Easter.

THE Sunday-school which is being added to Richmond Hill Wesleyan Chapel, Leeds, will consist of an assembly room, 64 ft. by 35 ft., seated for 450 persons, and on either side classrooms. An infants' class-room, &c. The cost will be £2,800. The architect is Mr. G. F. Danby, of Leeds.

The Builders' Journal COMPETITIONS.

No. 1.—A Sea-side Bungalow.

The drawings submitted in our First Competition are now being judged by

MR. ASTON WEBB, F.R.I.B.A.,

and his awards will be announced in due course.

No. 2.—A Village Club House.

The Proprietors of the BUILDERS' JOURNAL invite drawings, in competition, from those under twenty-six years of age, for a Village Club House, on a corner site, 150 feet by 40 feet. The Club to contain a general room with a dais for the villagers, a reading room and library, a bowling alley, service bar, tea room, committee room, housekeeper's apartments, and three cubicles for public use. The necessary outbuildings must be provided. Cost not to exceed £2,000. Drawings to be delivered at Talbot House, Arundel Street, Strand, not later than Monday, the 6th May, 1895.

RULES.

- 1.—There must not be more than three separate sheets of drawings submitted by any competitor in any single competition.
- 2.—The scale must be a uniform one of 8 feet to the inch for plans, elevations, and sections. Detail drawings must be to half-inch scale, and a perspective in ink may be included.
- 3.—All drawings must be inked in, and be without colour or wash.
- 4.—Drawings in each competition must be sent in on the date specified, and must be submitted under a motto, accompanied by the name and address of each competitor in a sealed envelope.
- 5.—All competitors must be under the age of twenty-six.
- 6.—A public exhibition of the premiated designs will be held. The result of each monthly award will be announced in our columns and the assessors' reports will be published in full. The drawings will remain the property of their authors, but we shall reserve the right to reproduce any we think fit.

THE AWARDS.

- 1.—A Gold Medal and a Cheque for £10 10s., to the competitor who submits the best half-dozen sets of drawings during the session of twelve months.
- 2.—A Silver Medal and a Cheque for £3 3s., to the competitor who submits the best single set of drawings during the session.
- 3.—Certificates signed by the Assessor and countersigned by THE BUILDERS' JOURNAL, will be awarded to the authors of the premiated designs in each competition, who will each receive a cheque for half-a-guinea for out of pocket expenses.
- 4.—At the end of the session the whole of the premiated designs will be submitted to a committee composed of the monthly assessors, and the Gold and Silver Medals and cheques will be awarded by them.

The portion of Hesketh Memorial Church, Southport, to be first built, will comprise nave, aisles and chancel, and vestries, at a cost of £12,000, with accommodation for 1,000; provision being made for a future tower, transept, &c. A few architects have been selected to compete, the plans having to be submitted at any early date.

In the course of a few weeks, Islington will be placed in possession of its third baths and wash-houses. Unusual difficulty and delay were experienced with regard to the building site, but at last a piece of ground in Tibberton Square, Essex Road, was secured for £5,250. Mr. A. Hessel Tiltman, the architect, who designed and carried out the two previous establishments, has been appointed architect.

The Builders' Journal.

MEN WHO BUILD.

No. 8.

MR. JAMES BROOKS.

If you have ever mounted the steep stairs of 35, Wellington street, Strand—if you have had anything to do with building these forty years, especially church work, you will know the way and how breathless the journey—it may have struck you that there are more drawings and plans in the offices of Mr. Brooks than

ever architect drew. They lie about in heaps, in bundles, in portfolios, the dust of years upon them with the appearance of the dust of ages. Yet how many of these are the work of one determined head, chock full of church ideas, and one skilled pair of hands. For many years Mr. Brooks scorned assistance, hating pupils as the Devil is supposed to do holy water, in forty years practice having only four young men "forced" on him; drawing and planning late and early, early and late; in every way, even in his art, a robust man; a man who still sticks to his desk, standing, and is young enough, though some way past sixty, to greet you in a shooting coat at the very top of those interminable stairs. Here is no *dilettante* of Persian rugs, pictures and fine china. The drawing desk grimly looks business, and you are in one of the finest rooms, so far as light goes, in London. The aspect is northern—the room being high above the chimney pots of the neighbouring houses—and the light floods the room—soft, generous, shadowless. Mr. Brooks is a great believer in a naturally well-lit room, and he prides himself on his "workshop" being one of the best, in this regard, in London. In the other "drawing" room, where Mr. Brooks' son works with his assistants, greater order prevails; drawings are prettily hung in gilt frames, as if they were the aristocracy of the business, while the leviathan working-drawings jostle each other in a crowd in the outer office. Mr. Brooks will tell you that his housekeeper has one

merit, she leaves dust alone. To disturb this, at this late period of progress, would be to obscure the perspective for all time.

James Brooks is a remarkable man, even among architects, and he was no less a remarkable boy. His father was a farmer of the old school, and one glimpse of James Brooks to-day would tell you of the bone and sinew of his stock. It was in Hatford, Berkshire, that James Brooks was born, a village to-day, and a village, neither more nor less, sixty-odd years ago, when the future architect came into the world, primarily it seemed to make acquaintance with his father's kine. Farming was farming then, *without* science. Perhaps it paid all the better without science, but, men and boys, they had to work. A singular thing about the village of Hatford Mr. Brooks told me—its total population has not varied; a round dozen in his lifetime.

There they go: farmers and serving men, their wives and children, down an even healthy lane of life. But the lowing of cattle had no music for James Brooks. As a boy his gift for line broke loose within him; he struggled with ideas while he tended sheep in his father's fields. And so it happened, I

OUR SURVEY.

CONTINUING our Survey of the exhibits at the International Building Trades' Exhibition under conditions which allow of a free and unfettered judgment, we discover at

Messrs. Duckett's

Stand a collection of sanitary specialties, including Latrines, Slop Water Closets, Channel Gullies, and any number of Syphon Ventilating Traps, designed on the best common sense principles, and possessing all the qualities of good manufacture. There is one thing about the business qualifications of this firm quite worthy of mention. Messrs. Duckett see the value of good illustrated catalogues, and they have wisely gone to the trouble, for some years, to provide the public with remarkably clever detail drawings of their specialties. We have before us, as we write, quite a couple of dozen sheets full of scale drawings, most accurately planned and figured, from which the most detailed information can be gathered.

Messrs. Arthur Lee & Bros., Ltd.,

exhibit a collection of the white and coloured marbles most generally in use. Some of these are shown in flat slabs, and some in round columns. They also show a series of photographs of their yard and factory at Bristol, and of works which they have executed in marble. Notably amongst these are some photographs of the New Clifton Pump Room, the roof of which is supported by 20 columns; and 24 pilasters of Swiss Cipollino Marble. Each of the columns is a monolith 15 ft. in length by 1 ft. 6 in. in diameter. They have also specimens of Marble Mosaic, and some samples of Marbleised Slate which is manufactured by them. The sign at this Stand is also to be noted. It is of black enamelled slate, with incised and gilt letters thereon. The firm claim that by their process of enamelling they obtain a surface of a flinty hardness, which will withstand the weather even in this climate.

The Somerset Trading Company, Ltd.,

of Bridgewater, at Stand 164, Row F, have a small erection roofed with their improved plain tiles (a specialty with this firm), with barges, hips, and valleys. These tiles are manufactured by a patent process under heavy pressure, making them non-porous. They are free from kiln-cracks, tough, and of a pleasing colour. Size, 10½ in. × 6½ in., and if laid to 4 in. gauge 550 cover a square. They also show other roofing tiles of their manufacture—an improved triple angular tile having several advantages over the old pattern—they can be used with battens to different gauges in straight courses or with break joints; an interlocking double Roman square shouldered to break joint; their Patent Holdfast Double Romans, which cannot be blown off a roof, all being locked together; the ordinary Double Roman and Triple Tiles; Poole's Patent Bonding Roll and Phillip's Patent Lockjaw Tiles; Machine-made Ridge Tiles; Beaded and Ornamental Tiles of various patterns; a variety of Finials;

moulded Front and String Course Bricks with returns, &c. We notice the even and good colour of the manufactures of this firm. Of

The Plastic Marble Company,

who show their material applied to various uses, we hardly know what to say. Personally we do not love artificial materials manufactured for the sole purpose of imitating natural materials at a fraction of cost of the genuine thing. Of the wear of the plastic marble we have no personal knowledge, but we see no reason why it should not be long lived. Of the two columns built up at the stand, the one imitating "sienna" is one of the most remarkable pieces of deception we have seen, but the amazing colours which are in demand by purchasers of this kind of thing do not appeal to our sense of fitness. At any rate, plastic marble is as passable as polished slate and has almost as many virtues. Persons interested can see specimen work of the Plastic Marble Company at Harrod's Stores, the Duval Restaurant in Wormwood street, and the Chandos Hotel in St. Martin's lane.

Messrs. Stanley Bros.,

of Nuneaton, have built up a delightful little "boggie hole" of their glazed bricks, which appear to us of very fine quality. The brown enamelled bricks—why they are called "enamelled" we do not know—of which the plinth is constructed are extremely good, and the granite-faced glazed bricks introduced in band courses have taken our fancy so much that we intend to use them in a range of stabling about to be erected for the principal proprietor of the "B. J." The grotesque finial on the roof of this "hole" is of a fine rich red brown, and most cleverly modelled. The firm also show at an adjoining stall a collection of Blue's, Copings, Red and Buff Quarries, Red and Brown Roof Tiles and Chimney Pots, and various manufactures in Ornamental Red Terra Cotta. There are also, we notice, examples of Sinks and Gully Traps (hand pressed).

Messrs. S. & E. Collier,

of Reading, show a pretentious pavilion in Terra Cotta, which is not a credit to their reputation or their goods. Exhibitors should be wary of these specially designed baby palaces. They are generally manufactured and constructed in a mighty hurry, and being so brand new they show every possible defect, which in an ordinary way would not exist. In the specimens of their manufactures there are some very ugly joints. The tile hanging is very imperfectly done, and much general discredit will accrue to the reputation of a really excellent firm, as Messrs. S. & E. Collier are. We are acquainted with the goods of the Grovelands Potteries so that the little imperfections of their stall will make no bad impression on us, but if Mr. James Brooks, who is the "Men Who Build" in this issue of the BUILDERS' JOURNAL, to say nothing of such rabid haters of Terra Cotta as Mr. Leonard Stokes, could but see them they would be more determined in their hatred than ever. The Ridge Tiles

and Finials shown by this firm are quite beautiful.

Messrs. Ellis, Partridge & Co.

have an ideal stand, octagonal on plan, with a fine collection of the "Redbank" manufactures. We have never seen before such a number of different goods of such uniform colour and texture. Terra Cotta goods, moulded bricks of all description, chimney tops, floor bricks, red copings, elbow one another off the closely packed shelves. Messrs. Ellis, Partridge & Co. inform us that they have at their Measham Works, near Atherstone, the finest grinding machinery and drying apparatus for the manufacture of their Bricks and Terra Cotta goods, and they are undoubtedly of an excellent quality.

Messrs. Gibbs,

of Loughborough, have a small exhibit of their well known red and white facing bricks, sand faced pressed bricks, Terra Cotta strings, panels, diapers, red ridges, finials, chimney tops and many of the other multifarious goods manufactured by first-class clay working firms. Their sand pressed bricks are as good as any we have seen for a long time. The only exhibitors of York Stone are—

Messrs. Geo. Armitage & Sons,

Robin Hood Lofthouse, near Wakefield, who show six samples of blue and brown stone of various degrees of hardness, in cubes of 6 in., showing sawn, rubbed, and fractured facets. They are Robin Hood Blue, Carlinghow, Thornton Blue, Howley Park Brown, Bolton Wood, and a very fine grained nearly White Limestone, well worth the attention of architects and others who want an effective and good stone for fine mouldings and carvings. We understand it is very durable, and Messrs. Armitage offer samples and information to any interested enquirer.

Another glance at

The Albion Clay Company's

Stall interests us in Sykes' Improved Street Gully which has a great depth of water seal, and the outlet is much lower than in other gullies so that heavy traffic cannot break the pipe connections. An improved yard gully has a large grate area, and minimum exposure of water surface, the cleansing arm being fitted with Sykes' Patent Screw Stopper. Sankey's Improved Deep Intercepting Gully has a specially constructed galvanized iron bucket to collect the detritus, being easily removed without untrapping the drain owing to the great depth of water seal. Keith's Patent Water Testing and Flushing Trap for testing drain and soil pipes, and for effective flushing, is simple in construction and reliable in action.

Messrs. Thwaites Brothers, Ltd.,

exhibit a No. 10 Andrew-Howatson Diurnal Water Softener, capable of softening 1,000 gallons per hour of hard water, rendering it fit for all industrial and domestic purposes. These softeners can be arranged in any way to suit the building into which they are to be placed, and are the simplest and the most efficient in the market, requiring minimum amount of personal attention; also

model of Andrew-Howatson Filter for the removal of all suspended matter from turbid or muddy water, rendering it bright and colourless. A battery of these filters, to treat two-and-a-half million gallons per day, has lately been erected at Cairo, and similar ones are at work filtering town supplies at Paris and Nantes.

The honey-comb wine bins made by

Messrs. King and Smith,

are delightfully simple—and simple things have a great fascination for us. The bins consist of terra cotta tubes, circular in interior section, hexagonal on the outside. Each tube takes one bottle. If you are one of those fortunate individuals with a palate above cheap claret and the horrible concoction of the household brewer, you can lay down just as many tubes as your cellar requires, and be perfectly happy.'

The Paragon Bolt Syndicate, Ltd.,

of 14, Sherborne Lane, London, E.C., are showing, in addition to their Bolts for Doors, Cabinets and Casements, a specially designed spring flush bolt for stable work, that can be operated from either side of the door; it appears to be thoroughly efficient, and can be manufactured in iron or brass. An automatic catch for Cupboards and Cabinet work is extremely neat and simple, and should commend itself readily to architects in place of the abominations usually used for cupboards. Nothing is visible of the catch when the doors are closed. A decided little pull opens the cupboard instantly. The "Chancery" letter box is also exhibited, from which it would appear well nigh impossible for "outsiders" to extract letters; this desirable and unusual security for letters is obtained in a very simple and ingenious manner, and the stallkeeper informed us that a japanned letter box fitted with good lock

and key and the patent safety attachment is sold for ten shillings. It is about time that the Postmaster-General had some such arrangement as the "Chancery" attached to all pillar and wall letter boxes.

John Tann's Exhibit

consists of all the different descriptions of Safes, Strong Rooms, and Fireproof Doors. The special feature of the new pattern Party Wall Doors is an angle iron stile on door, instead of the ordinary flat stile, the advantage being that it adds greatly to the rigidity of the door and prevents its warping, a consideration of the utmost importance in event of fire; the price is also much lower than that charged for the usual paneled doors. New pattern fire resisting Warehouse Doors are designed for heavy risks of fire. The back of the door is fitted with a 4-in. chamber filled with steam-generating fire-resisting composition. An ingenious bolting arrangement is fitted, which ensures the door being fastened, as only one movement is required to throw a bolt at top, bottom and front. In face of the failure of so many doors in recent great fires, this is just the thing that seems wanted. There are ordinary paneled Party Wall Doors and Plate Closet Doors for butlers' pantries; Strong Room Doors of various qualities, and a very fine specimen of a Fire and Burglar Proof Bankers' Bullion Room Door, weighing two tons, complete with steel vestibule and ventilating grille. Mr. Tann also shews a neat Five-guinea Safe for dwelling house use, and elaborate Burglar and Drill Proof Diamond Merchant's Safe.

We have returned to the Stall of

The Expanded Metal Company,

completed since our former Survey, and have found, as we fully expected we should, one of those sparkling simple marvels which no

one knows why it was not discovered before. The inventor of expanded metal is Mr. John French Golding, who has already amassed a fortune in the States, where for the last twenty years he was a resident of Chicago. For many years prior to his having evolved this new idea, says an American contemporary, he published *The Industrial World* of Chicago, one of the ablest, most widely circulated and authoritative industrial journals in America. In this capacity he became familiar with almost every branch of industry, particularly the iron industries, to which his paper was chiefly devoted, and becoming impressed with the working possibilities of homogeneous metals, he evolved the idea of cutting alternate slits in sheet metals, and opening or expanding the sheets at these slits, thus to form a netlike open metal work. It most resembles woven wire, and is fast substituting its uses, because of the cheapness and rigidity of the sheets thus formed, qualities essential to the employment of metals for use as lathing, fencing, railings, guards, trellis work, etc. It was used for all these purposes almost to the exclusion of other forms of metal work at the World's Fair at Chicago. About thirty miles of expanded metal was used in and about the building for fencing and railings, and probably three or four times as much was used as lathing, hidden from view in the plastered walls and partitions. The system of expanded itself metal is extremely simple. All the subtlety of the thing lies in the machinery that expands it. Sheets of metal of varying thicknesses up to half an inch are run through a machine provided with cog knives which cut the sheets and drive them down into their "expanded" position in the same movement, and the method of their expansion brings the metal "end up" to whatever pressure is brought upon it. For instance, there is a six feet span of park fencing, about four feet high,

made out of a single piece of sheet metal four and a-half inches wide, and yet leaving a width of an inch and a quarter for its top bar. The cost of these panels is nominal compared with anything of the same size and strength. It is easy to imagine how far this system of expanding sheet metal can be extended, but nothing we have ever seen comes up to the metal "lathing." So easy of attachment and so cheap in cost. To give some idea of what can be done, half-inch rods suspended from a ceiling beam and screwed taut at the bottom end, can be covered with the metal lathing rendered on either side in lime and hair, floated and set, and then be only a couple of inches in thickness. We are afraid this system uses more plaster on the key side of the lathing than ordinary wooden laths, but that is doubly compensated for by the perfect keying, by the enormous rigidity of the partition which also tends to tie the interior of the house more firmly together, and by the thinness of the partition. There are a thousand other uses for expanded metal; it is applied on this particular stall in forming casings round iron stanchions, in fire-proof floor construction, in coverings of ceilings, and in other fashions; and in all there is one splendid qualification—the absolute minimum of metal with the maximum of strength, and that alone deserves the high praise we have bestowed upon it.

Messrs. Cresswell & Son,

of Bradford, show somewhere in the Exhibition an Asbestos Fire Blower, which, although we have been unable to discover it, recommends itself to us. It appears from information the makers are good enough to send us, that the blower consists of a sheet of asbestos cloth fitted to mantel opening, which is held or hung in position when it is necessary to revive a drooping fire. The "Curfew" arrangement of the same thing

which becomes a fixture and allows the cloth sheet to be rolled up out of sight when not in use. The whole thing is a useful novelty we should like to see.

We have paid a second visit to the

Self-Lock Roofing Tile Company,

and have had the manufacture of the tiles explained to us. They appear to be made from very excellent sand and Portland cement, in the good old proportion of three to one, and the hand machine that makes them is ingenious. A metal tray, the size of a tile, is inserted under a press and has the colour powder sprinkled over it. The cement and sand in a plastic state is spread over and rammed with a hand mallet. A double-handled knife then cuts off the superfluous material. The press is then pulled along its slide until it rests over the little tray of wet cement, when the "lock" of the tile is poured on down a funnel shaped V and the turn of a handle brings a knife through a slit in the funnel and chops off the "lock" to its proper thickness. Of the tediousness of the manufacture we have nothing to do; of the tile itself we have much. This is the first time that a tile is offered for roofing purposes that is not fired in a kiln, and the Self-Lock Roofing company have something to say on this score in favour of their manufacture. We do not feel ourselves qualified to express at the moment an opinion as to the lasting qualities of such a startling novelty, but we have possessed ourselves of specimens, and are submitting them to an expert, when we will deal further with them. This we can assert, that if the strength and lasting qualities of the tiles is proved, then there is no better covering for warehouses and other large roofs than these Self-Locking Tiles.

Of automatic windows which, on the pressure of a button, commence gymnastic exercises and eventually clean themselves

without the desire to break the neck of a pretty parlour maid, there is no end. The story of

The N. A. P. Window,

in a charming green and gold cover, has been sent to us, and we have seen the window itself at the Exhibition. It has many good qualities, the sashes are top hung instead of centre pivoted, and the stay bar is not nearly so clumsy as it looks, but the N. A. P. Company, however successful they may be with their window, have a method of sash opening which charms us, for until we saw it on their stall we knew not of its existence. The question we asked last week as to what we could do with our casements has been answered by this Company, they have metal and wooden ones, which open either inwards or outwards, and we recommend every architect in the Kingdom to see them immediately. As far as we are concerned the whole story of the N. A. P. Window need never have been written, but the story of the N. A. P. Casement is another matter. It interests us deeply. The address of the inventors is 157, Victoria Street, Westminster.

Robert Adams

shows many of his World-known Door Springs, Ventilating Apparatus, Casement Bolts, Victor Stays, and many of the door springs are most compactly designed and admit of ready fixing in any position. The Crown Victor Door Spring, for instance, can be regulated to suit any requirement, whilst the working parts are so arranged as to offer a minimum of friction, so enhancing the durability of these goods. The Impregnable Front Door Bolt, with automatic lever locking action, is also shown, and gives the greatest security, combining in one case the functions of a night latch, hall-door lock, and tower bolts. The lever combination is unpickable and unforcible, and so the inventor

ELLIS, PARTRIDGE & CO.,

LEICESTER AND LONDON,

(Stand No. 7, Building Trades Exhibition),

Manufacturers of

"Redbank" Facings, Ornamental

Brickwork and Terra Cotta, also

"Woodville" Sand-Stock Facings.

Slate Merchants, Slating and Tiling Contractors, &c.

London Agency—Mr. T. FREEMAN,

200 and 202, Phoenix Street,

St. Pancras, N.W.

assures us absolutely reliable. The quality of Robert Adams' goods may always be relied upon. They may be obtained at the Adams' Building Trades' Emporium, 67, Newington Causeway.

W. Peek Taylor,

of 40, Chancery Lane, has a couple of Gordon Terra Cotta Wind Guards exhibited, and as he has recently delivered to the Bank of England thirty-six of these curers of smoky chimnies, as a "repeat" order, it is pretty certain that the Gordon Wind Guard performs its functions. The price of these things is extremely reasonable, and they are not unsightly.

Turpin's Parquetry.

is one of those old established things that we

could hardly do without, and in design and finish it is quite perfect. We do not seem to come across much parquetry in actual work. No one can see Turpin's beautiful examples without longing to use it.

The Marpedo Compound Company,

of Reading, exhibits the Marpedo Washable Water Paint, and the panels that were shown to us were distinctly pleasing in finish. This material can be used in place of lime wash for any suitable purpose, and is made in many very charming colours.

Some of the most perfect specimens of turnery are shewn by

The Clapton Steam Joinery Mills,

at their stall; in fact, we have not seen anything more charming than the pitch pine

baluster made by this firm from the design, we understood, of Mr. Cates. The machinery by which these things are turned out is evidently of the most perfect construction. We should like to know more of these beautiful turnings.

The steel clad copper baths, shewn by

The Sanitary Bath Company,

of Camden Town, have an American flavour about them, and the perfume of otto of roses, and waiting maids with silken towels seem to be hiding somewhere in the background. Others beside Yankee millionaires may bathe in a steel plated bath, although honest glazed earthenware is good enough for us. No one can tolerate a marble grained abomination after seeing the exhibits of this company.

Messrs. Sagar Co.,

of Halifax, give us most delight. To watch the little tables over which the nicely planed wood travels and comes out fashioned for all sorts of uses, grooved or tongued or moulded, one can wonder to what end labour saving machinery will at last take us. Messrs. Sagar have a reputation for this species of machinery, quite unapproached. The specimens, shown in their bay are finely cast, the spindles are of fine steel, and the bearings are of phosphor bronze, and the various parts are adjusted to absolute nicety. We give an illustration of the "Premier" Hand and Roller Feed Surface Planing, Thickening, Moulding machine, which can be used by every joiner and builder who has power.

"The Marriage of Ingenuity and Simplicity."

MR. JAMES BROOKS, ARCHITECT.

suppose, that the waste of time, in the old-fashioned manner of threshing, one day struck the growing lad with the force of a sharp stone, and he set himself to remedy a laggard and a lapsing system; one which took the hour easily, never anticipating that "devil's own team"—steam. James Brooks invented a threshing machine, and people came to see it, even other inventors. No doubt they derived more benefit than did James Brooks, for that is one of the wicked ways of invention. But there must have been grit in his idea, for one maker acknowledged his indebtedness by presenting to Mr. Brooks, Senior, one of the first machines made, even then valued at £300.

The young inventor still claims your notice for there were other irons in the field. James Brooks turned his attention to the plough share, and it was immediately evident (to him) that the plough share—respectable relic though it happened to be—needed reformation. It is a singular instance in paradox that a man with such a love of the old and the venerable as James Brooks, should, as a boy, have set the traditional appliances of agriculture at defiance. No doubt the farmers of Berkshire used strong and lurid language, despising the fandangles of the architect to be. But it is a fact that he added a new "breast" to the old style of plough share, a "breast" which is practically the "breast" of to-day. The old style broke the soil unevenly and left it unfinished; the new "breast" curved the soil gently and beautifully away; herein, perhaps, the first hidden hint of Brooks' future predilection. Now you may see the furrows running to "vanishing point" on all respectably ploughed and rotund land.

There are men who lie fallow for a while and then prove themselves "strong land" before the world is aware of their existence. Such a man was James Brooks. The farm life fretted him, yet he was gathering strength without knowing it. No man, devoid of robust physique, could have marched with his work as he has done these forty years. He was twenty years old, and had never had a drawing lesson in his life, when he came up to London in 1847, full of a determination to design and to invent, and without much of the wherewithal that is the courage of less self-reliant men. There were twenty-four hours to the day in those times, as Mr. Brooks will tell you, and his experiences were harder than the average drawing board. He will laugh in good-natured appreciation of those days. There were firms and firms then, as now, but the young student's lot was at first cast with one of those establishments that lived to exist merely, and barely permitted their pupils to do that. And yet Fate did him an unexpected turn, for in 1849—you may care to see a reproduction of the little ivory admission badge—James Brooks was admitted to the Royal Academy Schools without effort, having "tried his luck" there. I suppose, because this triumph was so easy, he has never done much for the Royal Academy since. Norman Shaw was also entered "student" at that time, and the two men were as compatriots in a cause, only Brooks went into the field and hedges, while Norman Shaw, in more disciplined fashion, fought for the academic wing of that small army of architects who so surely rescued from out of the dreary ashes of the Georgian era so much of what is fine and free, simple and dignified in modern architecture. Later, James Brooks became associated with Maltby and Lewis Stride, and afterwards with Frank Cross, of whose office he was in sole charge for two years. It was a sort of Cox and Box arrangement, for the farmer's lad was smart enough to work for one man during the day and for another the greater part of the night, and, I would add, strong enough too. "Three 'shows' I ran,"

said the Gold Medallist of to-day, "and did something on my own account also!" If you were inquisitive you would learn how James Brooks did a great deal on "his own," working like a galley slave, and having the audacity to get married while most architects are still boys dreaming of building a Parthenon or a St. Paul's. "Nose to the grindstone" is Mr. Brooks' phrase for that time, but you are amused to note that the facial feature has not suffered. Work came to him while he was busy in the offices of other men, and in his early heyday he did without an assistant, even when engaged upon six churches concurrently, completing with his own hand the six sets of drawings. The young architect of to-day may like to have Mr. Brooks' philosophy summed up in a sentence. Here it is: "Work! Those who talk most know least." There is a spice of the old militant spirit in his attitude

to the young men of to-day. He speaks of them in a fatherly manner, and of some humoured tolerance. He can make even his strong points interesting, a success not always attained. The finest architecture in the World, he will insist to you, is that of the Greek and Egyptian Temples. "Such severity and dignity of line! Such a sense of proportion! Such elimination of the trivial, effeminate detail which I so cordially hate!" There he goes! In a careful cupboard he will reveal to you the MSS. of Professor Thomas Leverton Donaldson's invaluable lectures on the subject; lectures which ought to be read by every young student—alas! that they are so remote in Mr. Brooks' careful drawer. By these models the latterday builder of so many churches was guided. He learned to love their rigidity, their unbending discipline, their utter lack of the spirit of compromise; their power and their truth. And when he came to work in the Gothic and the Renaissance, the austere spirit was still upon him, he drew his lines before over-ornamentation could sap their strength, he gave height for dignity's sake, and space for light and shadow, and you have here the secret of Mr. Brooks' success as an architect. That he has worked in

brick so much is for the very prosaic and practical reason that, in the South of England at least, stone is too dear. The builder must work in the material that is to hand. The necessity for brick has given us those clustered brick columns in so many of Mr. Brooks' churches, and he has built churches in England, Ireland, Scotland, Wales, New Zealand, Australia, and South Africa, though to these Greater Britains he has not been. He can tell you of a mansion he built—by letter and telegram—for a rich Dutchman in South Africa, and of the visit of the owner to England to see the architect when the building was complete. There had not been a mistake; everything had been carried out to the letter, and lo! there had risen, far away in the Veldt, a house in the style of the Tudors. Of the "Queen Anne stuff," at present in vogue in England, Mr. Brooks thinks little, but you may find the real thing in Holland, he will tell you, and the real thing is charming. When he goes to Holland and Belgium, now, the ecclesiastics welcome him as an old friend. The man must have his little joke at the present phase (or craze) of building; he describes it as the terrible cotta! I suppose James Brooks could not be exhausted—certainly not in this paper. He rode to hounds till he was nearly fifty, and he only gave up shooting four years ago; he is a hearty fellow at his little "box," as he terms it, which he built thirty-three years ago, and still lives in, but it is probable you know, as well as I, where that is.

You will know his work if you know the man—what he has done, for instance in remodelling St. Mary's, Haggerston; the fine Cloister, almost hidden away, at St. Michael's, Shoreditch; the churches at Hoxton, Haggerston, Kensington, Hammersmith, Hornsey, Lewisham; the beautiful Church of The Annunciation, Chislehurst; and that vast scheme, but partially carried out, as yet, of Covent Hospital, Chapel, Cloisters and House at Edware.

Of Mr. Brooks' striking individuality in architecture a little incident may be recalled. Some while ago a young architect from London was staying at Doune, N.B. He attended the services in the Episcopal Church there, and afterwards he called on the Vicar and expressed himself as delighted with the Church. Without a moment's hesitation he said, "This is one of Brooks' churches I know." The Vicar enquired of his visitor if he knew the architect. "No," was his reply, "but I can tell Brooks' buildings wherever I see them." Our full page illustration is of his latest accepted design—a Church Tower at Dover.

James Brooks has won his Gold Medal and the reputation of being one of the most sincere and solid ecclesiastical architects in England.

THE electric lighting of Manchester has proved a great success. At the end of the first year's working, after paying interest on mortgages, sinking fund, &c., and excess of management expenses—always proportionately greater on a first year's working—the committee found themselves with only a loss of £209 18s. 10d. That was from March 31st, 1893, to March 31st, 1894. From March, 1894, to March, 1895, they would be able to show a profit (after deducting interest and sinking fund) of some £7,000 or £8,000.

A COMPARATIVELY small but important street improvement will be completed this month in the setting back of the line of building on the south side of Carr's Lane, Sheffield. Mr. Watson has accepted £3,000 to set back his property. With the improved facilities for traffic will be combined an important architectural improvement to the street. Advantage has been taken of the rectification of the building line to rebuild the premises affected. The new building, of which Messrs. Ingall & Son are the architects, and Mr. T. Johnson is the builder, is in the Renaissance, and consists of four storeys,

SPECIFICATIONS: FROM BOTH POINTS OF VIEW.

PAPERS READ BEFORE THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Members of the Architectural Association was held on Friday evening, at No. 9, Conduit street, under the chairmanship of Mr. E. W. Mountford, the President. There was a large gathering. Mr. Fletcher (Hon. Sec.), announced a donation to the library by the Secretary of the Report of the Smithsonian Institution for 1893, and a vote of thanks was passed. A vote of thanks was also given to Mr. J. M. Brydon, for conducting Members

The specification of to-day is an inordinately lengthy document as compared with those written say twenty years ago, and a mass of matter is now squeezed into its pages that serves only to perplex the clerk of works and worry the builder. I think a great deal of the extra length can be accounted for by the introduction of most of the "conditions of contract." These properly belong to the "contract" as the legal document, and only cumber the pages of what should essentially be the working document. Another cause of lengthiness is the way in which expanded descriptions of trade manufacture are worked in. The system of splitting up a specification, rigidly, into trades has much to answer for in introducing elements of confusion and

in the constant use of words defining quality. The words best, very best, proper, perfect, &c., are all relative terms of quality which frequently are quite differently interpreted by the architect and builder, the one using the word in the ordinary sense, and the other in the manufacturers' sense, and they should be quite abolished, and the definite expressions of the manufacturers used instead, as by so doing we shall, as regards materials at all events, have a common basis of agreement with the builder. A common defect is the frequent disagreement between the specification and the drawings it is supposed to describe. If quantities are supplied the surveyor can easily adjust the variations in description, but assuming their absence,

over the Chelsea Town Hall, Polytechnic and Free Library, on March 16th.

FROM THE ARCHITECT'S POINT OF VIEW.

Mr. E. C. Pinks had been announced to deliver an address on "Specifications: from an Architect's Point of View," but the chairman announced that Mr. Pinks was unable to be present owing to illness. His paper, therefore, was read by Mr. Fletcher. The following are extracts:—

I propose to examine critically the specification as it is; to pass from that to a consideration of the necessity of specifications as they are at present drawn; and thence to a few suggestions for the abolition of specifications as separate documents in a contract.

differences. Each architect has his own view as to where a certain article should go, and if he consistently follows out the trade system what a number of references have to be made before you find out all about a window for example. There are many cases where four or five references might be profitably put together, especially when you remember that the practice of allocating the items under trade headings differs considerably. What I want to emphasize is that a great deal of time might be saved by combining things together a little more than is done, and let the trade distinctions take care of themselves.

The phraseology of the modern specification also leaves much to be desired, especially

each person tendering puts his own construction upon the clause, with the inevitable result that whichever way the architect wants the work done an extra ensues. The drawings must be the paramount factor with the architect and builder, although the employer often attaches more importance to the specification, probably because he understands and can criticise a written description, whereas, alas! drawings to the average employer are like maps to a South Sea Islander.

Does it not come to this, then, that more work on the general or small scale drawings, and less in the specification, would tend to considerably reduce the friction between architects and their clerks of works and the contractors? Carry this idea to its legitimate

conclusion, and half the causes of dispute would disappear.

This brings me to the second division of my paper—viz., a consideration of the necessity of specifications as they are at present drawn.

It has always seemed to me that the necessary documents or instruments of a contract should be, first the plans, elevations, sections, and detail drawings; second, the description of the materials to be used, which of necessity must be a written document, and for convenience is called the specification; third, the conditions of contract, or legal restraints, by which you bind the builder to do the work in accordance with the plans and specification, and also bind the employer to pay for the work done.

To successfully carry out this idea it will follow that the small scale drawings must be prepared with perhaps a little more care and with considerably more detail than they generally are at present. I believe much greater attention is being paid to the small scale drawings than used to be the case. It would be perfectly easy for the draughtsman to add, either by writing or graphically, to the general drawings, most of the information which now burdens the specification. For instance, taking the elevations, why should you not express, once and for all, by printing on the drawings the facings you want, the arches, whether axed or rubbed, the parts of the work in bath or portland or in both, the parts to be cemented or rough cast, the windows which are to open and which fixed, the glass to be used, and many other things? On the plans, why should you not say what flooring or paving you require, what the hearths are to be, what thresholds, what roof-covering? On the section, the sizes of floor-joists and roof timbers, the descriptions of skirtings? Once on the drawings they are done with, few queries would arise, the surveyor will get through his work quicker, the foreman and clerk of works will not be divided between something on the drawings and a contrary description in the specification. This all may mean rather more work for the architect at first, but will not the apparent loss of time amply repay him in the end, and certainly save delay on the works? A specification of one hundred pages takes quite a week to write, and even then is by no means a perfect document. Supposing, instead of devoting a week to writing a specification, you gave that week to finishing up and noting the drawings, what a tremendous difference it would cause. Surveyors do occasionally find a set of drawings with all the sizes of timbers figured on, and what I now plead for is an extension of that principle to almost every detail in the building. To satisfy these conditions a set of drawings would have to include a little more detail work, especially in the sections, and the draughtsman would have to put his section lines where they would show most work, instead of shirking the stairs and the lantern lights, as they often do at present. A plan of the roof timbers would also be desirable and some of the joinery details should certainly be among the drawings. Assuming you intended carrying this idea into practice (of putting work on the drawings instead of into the specification), the following, I think, would be the additions:— On the plans: the floors would have the material stated and the thickness; as to how the floors were to be laid and the kind of jointing that would remain in the specification, without a detail showed it. The pavings also would be described, and the hearths, steps, stairs, the direction of the joists and strutting, and the trimmers and trimming joists which might not possibly appear on the sections. On the sections: the skirtings, dado, and picture rails, cornices, architraves, thicknesses of doors—description of plastering, whether cement or lime, also the dados

and tile-hangings. On the elevations: the facings, arches, mouldings, rough cast, timbering, tile-work, what windows fixed and which to open, the glass, the external doors, the window sills, steps, and stonework generally. The roof plan would show at a glance which slopes were to be covered with inferior and which with better slating, also the lap, and whether boarding and felt; the roof, whether tile or lead, the flashings and lead flats, and every other item which at present it takes a few minutes to find in the specification. From the drawings we turn to the specification, as I suggest it should be, and we shall find more than 75 per cent. of its bulk is gone. In the preliminary part all the legal clauses, such as protection, damage, insurance, payment, time, sureties, rates of wages, will all be relegated to the contract. In the excavator and bricklayer all the descriptions of materials will remain in, and the way they are to be mixed and used, but all such items as depths of excavations, thicknesses of concrete, beds of brick rubbish, thicknesses of walls, mortar, fireproof floors, drains, facing bricks, parts in cement, finishings of internal walls, arches, moulded and gauged work, air bricks; all these would be cut out—as the drawings would show them. The mason would describe the materials and setting, all other work would appear on the drawings. The slater also would describe the materials and nails to be used. The carpenter would give the usual descriptions as to materials and a general clause about providing all wood, bricks, fillets, slips and backings. The joiner would also give the description of materials and method of laying and jointing the floors. Sizes and number of hinges, and prices of locks and furniture (although this could be quite easily put on the details). The founder and smith would state descriptions of materials and tests, also any iron-work hidden away. All straps and bolts, railings, girders and joists, rain-pipes, and eaves gutters would appear on the drawings. The external plumbers' work would all appear on the drawings and only the materials specified. The internal plumber work is a little more difficult to dispose of and until detail-drawings are given for this work, it would have to remain in the specification certainly as regards small pipes and taps. The plasterer would only describe the materials and the proportions. All glass would be indicated on the drawings, and therefore the trade would consist of a line or two. The painter would remain very much as at present. I have taken a specification of 120 pages, and by cutting out the items which I consider might be fairly described or shown on the drawings, I find it gets reduced to thirty-two pages, which includes some four or five pages for provisional sums and other items for which drawings would not be given. I propose to abolish the specification entirely when bills of quantities are supplied, and utilise them in its place. I say that I expect some opposition to this proposal, because I know that there are some difficulties in the way, not the least being that employers know of the specification, and usually expect to see it, whereas bills of quantities to them are unknown. I can imagine some architects objecting to the change because it would give too great a prominence to the quantities, and that it would necessarily result in the quantities becoming a part of the contract; why they should not be I can never understand; the employer pays for them, and they are generally used for the purpose of settling up accounts. The clerks of works refer to the quantities as much as to the specification, when they are allowed a copy, but, of course, as they are merely statements of fact and not descriptive, they are not so useful for reference as they might be. But, after all, the Scotch schedule of quantities is specification and schedule, and where we have in England references by the builder to what

the specification says, in Scotland he refers to what the schedule states. What is possible there should be so here.

Surveyors ought not to object to the proposal, but ought to welcome it, as their work would be brought into greater prominence and into a wider sphere of usefulness than it is at present. For the architect would have it at hand for constant reference, to settle points in connection with the details; the clerk of works and foreman would also use it, and many extras which are now incurred in ignorance, through the bills of quantities being sealed to them, would be avoided. I am prepared to admit that the bills of quantities might be rather longer—that is to say, they would be as at present, plus the necessary detailed description of positions in the building; but a saving would be effected in the printing or copying of the specifications, and the extra time spent on the bills would be saved in the time usually spent in writing the specification. I do not wish it to be understood that this method would do away with the necessity for detail descriptions on the drawings, but I do believe it would relieve many architects, who dislike specification writing, from a labour which is irksome to them.

FROM THE BUILDER'S POINT OF VIEW.

Mr. Henry Holloway's (Holloway Bros.) paper was on the "Builder's Point of View," he said:—

My first suggestion may appear trivial, but from a builder's point of view it is of some importance, namely: The form and arrangement of the specification should be in the simplest language, carefully prepared and legibly written, also set out in clauses, and under proper headings, with marginal or heading notes, each paragraph being indexed. Don't send the specification copied on tissue or letter-pressed copying paper, which is in shreds before it has been on the job a month. In these days of cheap and expeditious printing I venture to urge that printed or lithographed copies be supplied. The conditions of contract should be attached to and form part of the specification. The quantities should be in conformity with the specification, consequently the draft specification should be in the hands of the quantity surveyor before he proceeds with his work; but a little latitude might with advantage be given to the surveyor to vary, or add to, in minor points, in order to bring the drawings, specification, and the quantities in perfect line with each other. The practice of specifying sub-contractors and specialists is increasingly resorted to, in some cases almost to the extent of having separate firms for the principal trades. Architects who have had works in the North of England, and adopted the system of employing a separate firm for each trade, know something of the inconveniences of this course of procedure. The practice, generally speaking, increases the cost, causes delay in execution, and creates a considerable amount of friction between all concerned. In cases of special works, for which special men are required, such as are not usually engaged by the builder, or in the fixing and arrangement of patented goods which the patentees have to guarantee the efficient working and durability of, it may be desirable to provide for the sub-contractor to completely finish his work. But this custom should be minimised as much as possible, so as to give the builder entire and complete control over the whole of the building in course of erection, as he has to be responsible for everything. In all cases where sub-contractors are engaged by architects there should be an undertaking from the sub-contractor to comply with the conditions of the builder's contract as far as the same are applicable to his work. Probably the bulk of the builders' difficulties arise from a want of definiteness in the description of the architect's requirements. General "covering"

clauses in specifications are much too frequent. If the architect has a difficulty in regard to his working drawings, or in connection with the site of the proposed building, and is unable to specify precisely what has to be done, he has resource to his familiar "friend" (the covering clause), and throws all responsibility upon the unfortunate builder. Here is an extract from a specification as a sample of what I mean. "Do all necessary cutting and making good. Supply all materials and workmanship necessary, although not herein specified, to render the whole of this branch of the trade perfect and complete to the entire satisfaction of the architect." The same clause, with a little variation, appears after each trade. Such conditions as these have only to be exposed to be condemned by reasonable men, but unfortunately they appear only too frequently in specifications. In cases where it is impossible for the architect to specify clearly and in detail, and for the quantity surveyor to measure, the work to be executed, the proper and just course to adopt, both to the client and the builder, is to provide an amount to be used under the architect's directions, and the work paid for either by valuation after completion or charged for as day work. There is frequently much indefiniteness in the specification with regard to foundations. The builder has to take many risks for which he has very little opportunity of forming any idea as to whether it will involve an expenditure of £5 or £500. There should be always a practical reason for what is specified, and nothing should be specified unless the architect thinks it absolutely necessary to carry into actual execution. Also care should be taken not to specify what is a practical impossibility. The following are a few specimens taken from specifications to illustrate my point—viz.: "*The excavation to the trenches is to be taken down to a perfectly solid bottom, and the bottom well rammed!*" One naturally asks, why ram when you have a natural solid bottom? Is it not possible that if ramming is enforced you will not have a good solid bottom? Supposing the foreman carries out the specification, digs the trench to the depth shown in drawings, and has the bottom well rammed for the architect's inspection, it is possible the architect may be deceived by the sound appearance of the bottom and have the concrete put in upon what is anything but a natural sound foundation. "*The concrete in trenches to be well rammed.*" The absurdity of this description is obvious. To ram concrete immediately it is thrown into the trench in a soft condition is quite useless and a waste of labour, and if rammed after it has commenced to set, it would only tend to prevent its adhesion. "*The stock bricks are to be hard, well burnt, perfectly square, and of uniform colour.*" It is only necessary to visit a brickfield, and see the making of stock bricks to know the impracticability of this description. The description is quite contradictory to the nature of stock bricks, which are burnt in large stacks or clamps of about half-a-million each, with fuel sprinkled between to help the firing. The bricks that get the strongest heat will be the hardest, and as a matter, of course, to an extent flared and varied in colour. The weight of such a large quantity stacked together before being burnt must of necessity press the bricks somewhat out of square. The beauty of stock-brick facing to my mind is the slight variation of colour. "*The mortar to be composed of one portion grey stone lime to two portions of clean sharp sand.*" Either the proportion specified is not expected by the architect, or he must be ignorant of the proper proportions of lime and sand for good mortar. There is no strength in the lime of itself. The proportion of one of lime to four of good clean sand makes the best mortar. Particular quarries

for stone are frequently specified (especially Yorkshire stone), which have been worked out for several years. It is desirable, as far as possible, to avoid the mention of particular quarries, unless the clause is modified by the addition of the following:—"Or stone from some other quarry equal in quality to that specified."

Perhaps the most difficult part of an architect's specification is that in reference to timber, and the builder finds it more trouble than all the other kinds of material combined. The architect generally makes certain ground for himself by specifying that it is to be "perfectly free from sap, large knots, shakes, and all other defects." Such a description is very admirable if the material can be so supplied, but it is perfectly well-known that this degree of excellency cannot be maintained, hence the difficulty of interpreting to what extent sap, knots and shakes will be tolerated. Unfortunately the opinion of clerks of works (to whom this is usually referred) varies very considerably according to their knowledge, or other contingent circumstances. It is a mistake to suppose that because there is a slight discolouration on the edge of the timber it is unfit for use. Care should be taken to see that no sappy wood is built into a wall, or fixed in a confined position where there is no air space; but for open roofs, floor joists, and such like, the timber will not rot or become weakened because of a little *blue sap*, which is frequently only surface deep. I venture to suggest the following as a reasonable description for timber and joinery deals, viz.:—"For the best class of work: 'The Memel or Dantzig timber of the best selected middling quality.' For ordinary class of work: 'The Memel or Dantzig timber of the good middling quality; or (where scantlings under eleven inch wide, and four inch thick), from sawn scantlings of an approved Swedish or Russian port, not inferior to a recognised good fourth quality Swedish brand, or third quality Russian hammer brand. All timber to be free from large and loose knots and shakes, also practically free from sap to the architect's approval.' For joiners' deals: 'Good quality, from approved Swedish or Russian ports, free from large and dead knots, shakes, and sap. Not inferior to a recognised first and second quality Swedish brand, or second quality Russian hammer brand.' Pitch pine, and Oregon pine is much used for timber work, also yellow pine for cabinet work, but neither of these American woods is suitable for positions exposed to weather and damp. But for interior work it is much cleaner in appearance than the Swedish and Russian goods. A point requiring the special consideration of an architect in preparing his specification is that of fixing the time to be allowed for the execution of the work, particular regard being given to the period of the year at which the building is to be completed. It frequently happens that a job, say of a new house or an addition to a house, to the value of £2,000 to £3,000, containing a quantity of good joiners' work, is commenced in July or August, and has to be completed by the Christmas following. The specification insists that the joinery work must be of thoroughly seasoned wood, roughly framed together, and put into drying room within a month after signing the contract. (By-the-by, notwithstanding the stipulations, it too frequently happens that the details are not supplied until after the roof is on.) A moment's thought must satisfy anyone with practical knowledge that to put good seasoned joinery into a building erected under such conditions, and at such period of the year, simply means ruination to the work, and ultimately serious trouble and expense in easing doors and windows, stopping open joints, touching up shrinkages, &c. Moreover, the builder is condemned for supplying inferior material. In all cases where good

plastering and joinery is required, architects should make arrangements to avoid either of the same being proceeded with to any great extent on the building during the winter months. In conclusion, I would urge that in order to avoid friction, disputes, and to secure good work, there must be mutual confidence between the architect and builder. To secure this the architect should only invite to tender (where competition is required) those with whom he can take counsel and place confidence. There is far too much suspicion, especially on the part of the younger members of the profession. I do deny there may have been reasons for it, but, speaking generally, builders have a regard for their reputation.

At the conclusion of Mr. Holloway's address, an interesting discussion took place on the subject as treated by both papers. Mr. Fleetwood said in regard to Mr. Holloway's paper, he fully agreed with all that he had said, so much so that he did not know of any points on which he could criticise it. But in regard to Mr. Pinks' paper he regretted it; it was not accompanied by his ideal specifications and drawings. It would be interesting to see the drawings after they had been in use for six months. He was afraid that all the information that had been put on the eighth-scale drawings would be obliterated before the roof was put on, and he did not think that suggestion was a very practicable one.

Mr. Woodthorpe agreed with a good deal of what Mr. Pinks said about putting as much as possible on the drawings, although there might be one or two hundred items. In the country a builder depended vastly more on the drawing than he did on the specifications, and he personally had always found it much easier to see whether the work was carried out in the proper way if they had got the thing on the drawing than if he had got to wade through a specification 100 or 120 pages in length—however well it was indexed. He quite agreed that the covering clause should be done away with as far as possible.

Mr. Francis Hooper thought it was very important that architects should realise that it was not only the builder who tried to evade specifications and conditions, because they would find that some employers, and architects themselves tried to evade them themselves. (Laughter.) If they endeavoured to have more intercourse with the builders, as Mr. Holloway suggested, it would be to the mutual advantage of both.

Mr. Hampton Pratt thought the suggestion of Mr. Pinks to do away with specifications was a very bold one. He thought those who spoke most of the irksomeness and drudgery of getting out specifications, were those who knew least how and what to describe. (Hear, hear.) With regard to the writing of specifications in great details he thought it was unnecessary.

Mr. C. H. Brodie said he agreed with every word Mr. Holloway had uttered, but he thought Mr. Pinks' paper was full of fallacies. He did not see how Mr. Pinks' notion of abolishing specifications could be carried out in the case of alterations. Not only was a specification a check upon the builder, but was a check on the client.

The Chairman defended Mr. Pinks' paper in his absence. He was bound to say he saw little in it whatever to object to. The criticisms that had been made upon it had arisen, he thought, chiefly because the paper had not been carefully listened to. The length of a specification depended entirely on the quality of the work and the variety of detail. Mr. Pinks had had a lot to do with Scotch work, and possibly that might account for some of the things he said.

For the public fountain which is to be erected by Mr. Thomas, M.P., in Pontypridd, a design by Mr. C. B. Fowler, of Cardiff, has been adopted.

HOW TO OBTAIN ACOUSTIC SUCCESS.

A PAPER READ BY MR. BURROWS AT THE R.I.B.A. MEETING.

AN ordinary meeting of the Royal Institute of British Architects was held yesterday week, Mr. James Brooks (vice-president) in the chair.

The Chairman announced that an intermediate examination to qualify for registration as Student was held on the 19th, 20th, 21st and 22nd March. Applications were received from seventy Probationers, including those relegated from previous examinations. Of these, fifty-six were admitted, and fifty-four presented themselves and were examined; twenty-eight passed the examinations, and twenty-six were relegated to their studies. The names of the successful students, placed on the paper in order of merit, were as follows: John Ormrod, Bolton; Ernest William Marshall, London; Thomas Anderson Moodie, Hillhead, Glasgow; Thomas Spiers Fraser, Glasgow; Ernest Jesse Mager, London; Tom Norman Dinwiddy, Greenwich; Victor Evans Bösher, St. Leonard's-on-Sea; Herbert Haines, Bedford; Frank Ward, Bradford; Louis Moore, Southampton; William Stanley Bates, Bedford; Percy Bown, Harrogate; James Henry Coram, London; William Alphonsus Scott, Drogheda, co. Louth; Alexander Godolphin Bond, B.A., Bristol; Wallace Stevens Jones, Bristol; Arthur James Ecclestone, Great Yarmouth; James Stockdale Harrison, Leicester; Hugh Alfred Ellis, Manchester; William Vincent Morgan, Carmarthen; Arthur Reutlinger Gough, Redland, Bristol; George Herbert Manning, Harlesden, N.W.; James Edward Coleman Shield, London; John Arthur Smith, London; Edward Hale, King's Norton, Birmingham; Stanley Edward Knott, East Barnet; George Westcott, Old Trafford, Manchester; and Rupert Claud Austin, Cambridge. A paper on "Sound in Its Relation to Buildings," was then read by Mr. H. W. Burrows. He remarked that the form which a building should assume to insure acoustical success was a question upon which much difference of opinion existed. Simplicity of plan was not of necessity good for acoustics, square rooms being often found to be defective. Most authorities condemned flat surfaces, as reflections took place in the right angles of such apartments, at the floor, walls, and ceilings. It had been found of advantage in such cases to cant off the angles of rooms, or to curve the ends, or to place the speaker near the corner of the room, so that he addressed the audience diagonally. Some writers considered that if rectangular rooms were adopted they were improved if one dimension was longer than the other. Sound waves being propagated in spherical layers from their point of origin, curved forms had been recommended, but opinion was not unanimous on that point. Of buildings having a circular plan, St. Paul's was a well-known bad example; but this was mainly due to the close proximity of the speakers to the walls. Another effect would be produced if the speaker were situated in the centre of the circle or near it. Certain inconvenient acoustical effects experienced in buildings of circular plan were not met with in those where the walls were broken by a large number of deep embrasures. The Albert Hall, London, a building of the oval or ellipse type, had been almost universally condemned. Before it was built failure was predicted, as the reflections from such a form were known to be concentrated in the foci of the ellipse, and this, together with its vast size, form, and material of roofing, had combined to produce a great acoustic failure, modified to a certain extent by the introduction under the roof of a velarium. The amphitheatrical type of plan had proved successful in many instances; but some notable exceptions chiefly by reason

of excessive sonorousness, were referred to. Other types of plan were those in which the end was more or less curved, and the sides produced somewhat after the plan of the basilica. The L.C.C. council chamber, an example of this method of planning, was considered to be an acoustic success. One writer proposed to terminate rectangular halls with a parabola, and give a parabolic form to the roof over the platform. It was objected, however, that all sound originating in the body of a hall might be concentrated in the focus of the parabola, so that great difficulties presented themselves in dealing with a curved surface of that nature. Among buildings planned as elongated rectangles with rounded ends which were successful acoustically was mentioned the Queen's Hall, Langham place, a noticeable feature of which was the truncated, trumpet-shaped orchestra. The horse-shoe type of plan, largely adopted for theatres, had been attended with but varying success, depending much on the materials used in construction, and largely influenced by the boxes. Examples were mentioned of what the author termed a composite type of plan, in which the walls at the rear of the speaker or orchestra were formed as a truncated pyramid, diverging outward, with the seats arranged in a semicircle or other curve. In churches and cathedrals, the avenue type of plan had been criticised, because the columns which carried the arcades caused sound shadows, and were therefore objectionable. With regard to the influence the section of structures had on the propagation of sound, most writers agreed that smooth surfaces reflected sound, while broken or rough surfaces dispersed or absorbed it, so that in some instances it might be found advisable to break up the ceilings with rafters, or to form recesses or projections in the walls. A chief consideration in this connection was the size of the room. As to the form of ceiling, various conflicting opinions were quoted and examples cited, it being generally agreed that right-angle junctions between walls and ceilings were bad, as confusing reflections resulted, to obviate which some form of cove had been usually adopted. The difficulties presented by concave curves were shown by the failure acoustically of most domes or cupolas, due usually, it had been said, to the powerful and prolonged resonance produced. To prevent the loss of sound upward it was probably best to keep ceilings moderately low, consistent with good proportion. With regard to the dimensions of a building, what was known as harmonic proportion was strongly urged by many. For good acoustic properties, it had been maintained that a building should be so constructed that its different dimensions should be in some simple relation to each other. In treating of heating and ventilation and their effect on sound, Mr. Burrows said, a series of tests at the Baltimore Academy of Music had proved that the almost perfect acoustic properties of that building were largely due to the condition of the air, and not to the plan. The direction of the ventilation was of little or no moment. The principal office of ventilation in its acoustic bearings seemed to be that it rendered the air free from those acoustic clouds which disturbed, diverted, modified, or absorbed sound waves, as atmospheric clouds modified or destroyed light. The key-note of rooms was next considered. A hall built of masonry had a different note composed of that material. Beneficial effect had resulted from the presence of an audience, the addition of shelves filled with books and papers, the use of a velarium, flags and such like hangings, Venetian shutters, sounding boards. The use of wires and cords had been successfully recommended; the author referred to the bye-gone use of acoustic vases in classic theatres and in Mediæval churches.

SHEFFIELD SILVER PLATE.

THE "QUEEN'S" OR THE "LEOPARD'S" HEAD?

THE idea said to be prevalent in London regarding the merits of Sheffield silver ware, met with a strong condemnation by Colonel Bingham, who dealt with the subject at the recent Art Crafts' Exhibition in Sheffield.

"At the opening of the Exhibition," said Colonel Bingham, "Mr. Green stated he went into a shop in Bond Street and asked for some fine modern Sheffield plate, but was informed that there was no artistic work to-day in Sheffield, and that Sheffield was called 'The modern Tomb of Art.' In reviewing this statement, Colonel Bingham pointed out that large quantities of manufactured silver were sent daily to London from Sheffield, and that no city took so much silver work from Sheffield as London did. Two-thirds of the silver table ware of London was manufactured in Sheffield. Forty years ago it was his duty to call upon many manufacturers and silversmiths in Sheffield, and he then found that there existed a system under which a very large amount of sterling silver ware made in Sheffield was sent to London, where the London mark was stamped upon it. This system, he was sorry to say, prevailed to a very great extent to-day among people who ought to know a great deal better. He was not one of them, and was averse to the practice unless he was obliged to revert to it owing to stress of time, and to this point he would address himself later. The practice to which he alluded was contrary, he thought, to the spirit of the Merchandise Marks Act, and went to prove the unreliability of the observation made to the Master of the Guild by the Bond Street dealer with regard to the absence of artistic work in Sheffield. It was a shame that the London mark should be placed on the wares made by Sheffield silversmiths, and he thought the Sheffield mark, the Queen's head, should be accounted a far superior mark to the Leopard's head, the mark of London. There was another point with regard to assaying, with which he would like to deal. In Sheffield the Assay Office had been removed from Fargate to Leopold Street. The Corporation had paid a large sum of money for the ground upon which it stood, and he had no doubt that the money had been spent properly. The offices had recently been enlarged greatly in order that more work might be dealt with, and he hoped and thought it would not be found to be too large. In his opinion, it would have been much better if the small premises had been used and kept open every day in the week. Those who were not connected with the silver trade would perhaps be astonished to learn that if a silversmith sent in any goods after ten o'clock on Monday morning he could not get them out until Wednesday night. The result was that in his case some thousands of ounces of silver had to be sent to London to be assayed in cases of urgency. This was a great detriment to Sheffield. It would not be necessary, if the Sheffield Assay Office were open every day in the week. There was no doubt that the Government were right in having the Assay mark placed upon silver goods for the protection of the public, but, at the same time, Sheffield ought not to be handicapped by the closing of her Assay Office on alternate days, when in other cities, with whom her manufacturers had to compete, goods might be assayed every day. He thought the Master would agree with him when he said that if the Assay Office were to try in these competitive days to damage trade they could not do so more effectively than by the action they had taken. He concluded by congratulating the Guild upon the unearthing of so much talent, the presence of which was a direct answer to the Bond Street dealer."

Trade and Commerce.

We shall be glad to receive copies of catalogues from firms engaged in the allied building trades. These will be carefully looked through, any novelty noted, and—should its nature seem to demand it—fuller attention drawn thereto. We are particularly wishful to secure the friendly interest of designers and artificers in *THE BUILDERS' JOURNAL*, and, now and then, we might see our way to reproduce an outline sketch or illustration of any contrivance that struck us as being new or needed. Building covers up—figuratively, and in fact—so much ground, and we mean to cover the whole of it.

We should be further obliged if firms would indicate, by some suitable mark, the pages in their catalogues to which they would, in particular, desire to call our attention.

Messrs. Baird, Thompson & Co.—The contract for the ventilation and heating of St. Mary's Church, Dover, has been placed with this firm.

Mr. Thomas Freeman.—Mr. Freeman desires us to notify that he no longer represents Messrs. P. & S. Wood, of West Bromwich, but supplies Blue Staffordshire goods of his own selection from his stores at St. Pancras Station.

Brighton Improvements.—It is proposed to make additions to the Town Hall at a cost of more than £20,000; to build a Fruit and Flower Market, New Police Courts at a cost of nearly £25,000, and a new Fire Brigade Station. Tenders are to be procured immediately.

Messrs. Gibbs & Co.—This firm has just completed a large stained glass window at St. John's, Bethnal Green.

Messrs. Ratty.—The macadam scarafier, made by Messrs. Ratty, is being tried on the Embankment roadway. It churns up the surface much as a garden rake would soft made ground.

Safety Sashes.—There is an epidemic in the joinery trade. The Building Exhibition contains no less than seven different systems for opening sashes for purposes of cleaning the outsides in safety. Nine patents for nine other systems have been registered during the past two months. They are getting as common as "smokeless" chimney cowl.

Admiralty Work.—From the statement of proposed naval works, drawn up by the Admiralty, it seems that an expenditure is proposed of £681,000 at Gibraltar, £650,000 at Portland, £1,920,000 at Dover, £290,000 at Hong Kong, £595,000 for naval barracks at Portsmouth, and £179,000 for superintendence and miscellaneous charges—in all £4,315,000.

A New Catalogue.—The Albion Clay Company have in preparation a catalogue of the sanitary wares manufactured by them. It is to be in colours and is promised to be quite an authoritative work on Sanitary Science.

The Bath Floods.—The City Council of Bath received last week a report from Messrs. Coode, Son and Matthews on the mitigation of floods in the city, and decided to engage the services of these engineers to furnish plans and estimates of the cost of carrying out so much of their original scheme as includes the lowering of the Pulteney and Twerton Weirs and providing movable sluices thereat, and, further, to report upon such other obstructions as they deem it essential to deal with. After a long discussion, it was decided to instruct Mr. Radford, C.E., to complete his plans of intercepting sewerage and of sewage disposal, and to furnish estimates of cost.

The Building Trade in Newcastle.—The building trade is once more fairly under way in Newcastle. There is a good deal doing, and a good deal more in the way of house-erection is promised in the near future. Mr. Hope's plans for buildings on the Sandford estate provide for from 500 to 600 dwellings. These will comprise villas, self-contained

houses, houses in flats, and semi-detached villas. At Byker, it is purposed shortly to commence house-building on the site of Gray's brickfield and adjoining land in the rear of the Conservative Club.

Leeds Water Supply.—The water supply of Leeds is in the hands of the corporation, and it is interesting to know that last year 4,745,000 gallons were distributed, of which 1,212,000 gallons were sold by meter for trade purposes. The income received amounted to £106,828 17s. 6d., the working expenses, £24,536 11s. 6d.; the interest on the debt £57,857 5s. 11d.—leaving a net profit of £24,434 19s. 1d. Such is the advantage of having a municipal supply.

Amalgamation of Works.—The South Wales Portland Cement and Lime Company, Limited, of Penarth, inform us that they have taken over the following works: The Aberthaw Pebble Lime Company, Aberthaw; The Aberthaw Blue Lias Lime Company, Bridgend; and absorbed the same into their present business. This gives the company a total output of about 1,000 tons of hydraulic lime weekly.

Bristol.—The Docks Committee have decided to provide additional lairage accommodation for 75 cattle, and to accept the tender of Messrs. Fountain & Boyd for the work. Also to construct chill rooms for from 200 to 400 sides of beef. Alterations—recommended by the engineer—to the abutments of Brislington Bridge and the gangway across the lock at Avonmouth Dock, have been approved by the committee; and repairs to the east side of Avonmouth Dock at a cost of £250 are also proposed. The borough engineer has prepared a report upon the question of the prevention of floods, the total estimated cost being £46,000.

Drainage Work.—Under this title a little book, reprinted from *The Surveyor*, and prepared by William H. Maxwell, of the Engineer's Office of the Leyton Urban District Council. The little book has for its object the massing of facts connected with the construction, examination, and testing of drainage works. The pages are profusely illustrated with most carefully prepared drawings, and the booklet is as handy a reference work as we have seen. The cost is one shilling.

Wood Pavement.—Messrs. W. Garstin and Sons, 760, Harrow Road, London, W., have procured letters patent for a non-slipping wood pavement, which consists of holes being bored in the blocks, into which are inserted plugs of lead. It is held that lead, being a material that will not disintegrate and "carry," it will always hold its own so far as wear is concerned, and that its introduction into wood paving improves rather than deteriorates its quality and durability while it increases its value as a safe foothold.

Messrs. Peace & Norquoy.—One of the most interesting and useful inventions for dividing schools is the Patent Improved Folding Partition of which Messrs. Peace & Norquoy, of Port Street, Manchester, are the makers. This partition was awarded the prize medal of the Sanitary Institute of Great Britain at the Health Exhibition, Liverpool, 1894, which, we understand, is the first and only medal ever been awarded for folding partitions. According to the testimony of a large number of eminent architects, School Board clerks and others, the partitions supersede all other methods of dividing and sub-dividing rooms. A boy of ten years of age can, with the greatest of ease, draw a large partition into position or fold it back against the wall in two minutes. We are informed that they are being fixed in a large number of schools all over England—seventeen having been recently fixed in the Congregational schools, East Finchley, under the superintendence of Messrs. Spalding & Cross, architects, London. Messrs. Kelsey & Head, architects, Horley, Surrey, have also introduced the partition in the Albert Road schools, Horley.

Strand, W.C.

Correspondence.

The Editor welcomes Correspondence on matters of general interest. Gentlemen thus addressing the Editor should condense their communications as much as possible.

C. W., Napton, Rugby, writes: "Some horticultural builders have put up a long range of houses for me, and heated the same with cast-iron hot water pipes which were coated with 'Dr. Angus Smith's composition,' to prevent corrosion. The gardener now says the pipes throw off an offensive smell when heated, which is injurious to his plants. I have used pipes coated with this composition for over 30 years, and know it is an excellent preservative, but I never used it on hothouse pipes before. Before I agreed with the horticultural builders, I asked if it would be right to so coat the pipes, and the makers (McDougall Bros., Manchester, and several other firms) said nothing injurious could possibly come from the use of it. I believe it is a fact, that when the pipes are heated very hot, plants put near die off at the ends. Can anyone tell me if this is likely to be caused by the coating on the pipes? If so, can anything—and what—be put on the pipes to prevent it? Would red lead paint, mixed with boiled oil, do it?"

BOOKS RECEIVED.

The Cathedral Churches of Ireland:

Being notes, more especially on the smaller and less known of those Churches. By T. M. Fallow, M.A., F.S.A. With fifty illustrations. London: Bemrose & Sons, Limited, 23, Old Bailey.

Mr. Fallow has a heart for the poetry of descriptive writing, and it has helped him to produce a delightful little work, which, it quite simple in its architectural treatment of the small historic Churches of Ireland, still helps us to believe that there is a deal of happy old work in a land he certainly should not have hunted to discover it. We cannot say much for the illustrations which are crude and, in many instances, carelessly drawn. It is a pity that ninety-nine pages of charming and simple descriptive writing should be so poorly backed up.

SOCIETY MEETINGS.

Birmingham Architectural Association.—The concluding meeting of the session was held in the Exchange Rooms, when the officers for next session were elected. Mr. H. R. Lloyd read a paper upon the five days' sketching excursion to Broadway last July, illustrating his account with photographs and sketches made by the members and enlarged by means of the lantern. Ludlow is suggested as the sketching ground for next July, when it is hoped a good number of architectural students will join, the district being particularly rich in examples of old domestic buildings.

Northern Architectural Association.—The annual meeting of the Northern Architectural Association was held in the Meeting Room, Art Gallery, Newcastle. Mr. James Oswald (president) presided, and there was a good attendance. The hon. secretary (Mr. A. B. Plummer) read the annual report which recorded the increasing prosperity of the Association. Since the last annual meeting five members, twelve associates, and twelve students had been elected; and the membership now numbered 45 members, 57 associates, and 37 students. The following had taken the prizes in the students' competitions for measured drawings and sketches: Messrs. G. C. C. H. Crawhall, R. P. Twizell, S. M. Mould, and G. Brumell, junr. Fifteen members of the Association entered for the Cambridge University Extension Examination, and all passed. Mr. S. M. Mould, Mr. J. L. Nicholson, and Mr. M. G. Martinson had been awarded prizes in other competitions. The following members had passed the examinations of R.I.B.A.: Preliminary, Mr. S. M. Mould and Mr. A. K. Tasker; Intermediate, Mr. S. E. Barrow and Mr. R. H. Morton; Final, Messrs. F. E. Coates, C. S. Errington, J. C. Maxwell, and J. Spain. The Council were glad to be able to state that almost all the older and leading members of the profession in the two counties were now connected with the Association. One new member, five associates, and six students were elected members of the Association.

Liverpool Engineering Society.—The fortnightly meeting of this society was held on Wednesday evening at the Royal Institution, Professor H. S. Hele-Shaw, M.Inst.C.E., presiding over a large attendance. The evening was devoted to the discussion upon a paper read by Mr. D. B. Morison, M.Inst.M.E., of Hartlepool, at the last meeting on "Marine Evaporators," in which he dealt with the general advantages of marine evaporators, and described in detail the arrangements of the various classes of evaporators now on the market. A large number of members took part in the discussion.

For the new schools to accommodate 200 children, which the Llangoed School Board have decided to erect, Mr. Glynne Davies, Bangor, has been appointed architect.

"Architectural Ironwork: Constructive and Decorative. A Series of Instructive Papers for the Artist and Worker." The continuation of Chapter VI. is held over until next week.

SAWDUST.

S. PETER'S ROMAN CATHOLIC CHURCH, Lancaster, together with the Convent, Presbytery and Schools, generally considered to be the best work of the late Mr. E. G. Paley, will shortly have new Boys' Schools added to accommodate 350. Plans are being prepared by Messrs. Paley, Austin & Paley, architects, at a proposed cost of £4,000. Additions are also being made to the Presbytery at a cost of £2,000 from plans by the same firm.

We understand that Mr. C. J. Ferguson, architect, of Carlisle, is about to start for Athens to make an investigation into the damage done to the Parthenon by the recent earthquake.

The various schemes prepared by the Borough Surveyor for utilising the Commercial Hotel in Market Square for providing additional municipal offices and police accommodation at Lancaster, have been considered, and the Surveyor is instructed to furnish an estimate of the cost of carrying one of such schemes into effect.

At a recent special meeting of the Lancashire Asylums Board, the Rev. C. T. Royds said the plans of the building for the new asylum at Winwick had been much altered and modified, with a view to the accommodation of chronics and imbeciles, sick and infirm, of acute cases which might arise among in-patients, and of epileptics. They had had a communication from the architects to the effect that this would mean a saving of from £2,000 to £3,000.

The Board of Guardians, at a recent meeting, decided on a series of alterations in the arrangements of the Bath Workhouse, intended to remedy the defects in its accommodation disclosed a little time ago. It was resolved to enlarge the infirmary, and the laundry arrangements having been condemned as very defective, it was decided to build a new laundry. The total cost was estimated at about £6,000.

The Glasgow Town Council has decided upon the erection by the corporation of tenements of shops, warehouses, and dwelling-houses in Trongate, King Street, and Parnis Street, to the aggregate value of £29,000.

From plans prepared by Mr. J. William Trounson, of Clarence Street, Penzance, the Bible Christain Chapel, at Hea Moor, is about to be renovated and enlarged, and a new schoolroom will also be added.

In the district of Piacenza, a village called Bollara has been completely buried by an enormous landslip nearly a mile in extent. Fortunately the movement of the mountain was noticed in time for the inhabitants to escape.

It is with regret we record the death of Mr. Ernest Turner, F.R.I.B.A., from heart disease, in his 51st year. He had been for twenty years a member of the Council of the Sanitary Institute, and he was almost from the foundation one of the judges of the exhibitions held in connection with the annual Congresses of the Institute. He was the chairman of the Council, and presided at the Council meeting only two days before his death. Mr. Turner had a large consulting practice in connection with the reconstruction and drainage of provincial hospitals, schools, and country mansions.

The restoration of Portobello Parish Church, which was damaged by fire towards the end of last year, has been completed. The internal plan remains as before; but an entire change of decoration and the addition of leaded cathedral glass, give the interior quite a different appearance from what it had. The work has been carried out from plans by Mr. J. Macintyre Henry, architect, Edinburgh, at a cost of about £900.

The working men's club at Gainsborough is about to be enlarged at an estimated cost of between £600 and £700.

COLONEL DURNFORD, an inspector of the Local Government Board, recently held a series of inquiries into applications of the Manchester City Council to borrow sums amounting in the aggregate to more than £260,000. Of this, £100,000 was for the extension of the electric light system in the city, £100,000 for works of sewerage and sewage disposal, £50,000 (in excess of present borrowing powers) for the building of the Technical School, and £10,000 for the replacing of defective drains in the poorer parts of the city.

The Parks Committee of the Birmingham City Council has been authorised to provide a park-keeper's lodge and other accommodation at Adderley Park, at an estimated cost of £600.

The Bill promoted by the London County Council to empower them to rebuild Vauxhall Bridge upon the site of the existing bridge, came for consideration before a Select Committee of the House of Commons, and has been referred to the Unopposed Bill Committee.

New Schools are to be erected in St. George's Parish, Wigan. Sir Francis S. Powell, Bart., M.P., has promised to bear the whole of the cost, which is estimated at about £2,000.

The Merchant Taylors' Company has granted the sum of £525 to the St. Thomas's Hospital Special Appeal Fund for opening closed wards, which will be paid in annual instalments of 100 guineas.

Plans have been prepared for a proposed new infirmary in connection with the workhouse at Wakefield, the cost of which is roughly estimated at £25,000.

At a special meeting of the Rotherham Rural District Council on Monday last, Mr. R. Bradbury, of Chapel-en-le-Frith, was appointed surveyor of highways at a salary of £250 per annum. The applications numbered 180.

The pumping station and the new drainage works for the borough of Grimsby, which have just been carried out at a cost of £32,000, were formerly opened last week by Alderman George Doughty. The cost of the pumping station has been £4,500.

The new chapel at Blackley of the United Methodist Free Churches was opened last week. The chapel has cost about £2,600, of which over £2,000 has already been raised.

The Edinburgh and Leith Gas Commissioners have decided to re-roof a portion of their Edinburgh works at a cost of about £3,400.

The design sent in by Messrs. Campbell, Douglas & Morrison, Glasgow, for the Sandeman Free Library, Perth, has been awarded first place, and those by Mr. A. Grainger Helton, Perth, and Mr. Brown Watt, Aberdeen, equal. The cost of the Library is estimated at £10,000.

The plan prepared by Mr. H. Green for the proposed new school in East Street, Okehampton, has been adopted by the School Board. Mr. F. Yeo has been appointed architect for the Fowley Down School, for which he has prepared plans, the estimated cost being £297.

The tender of Mr. M. Otto, Lincoln, has been accepted for the construction of the new Unionist Club in Silver Street, Lincoln, the contract price being £5,500. The architect is Mr. W. Watkins, Lincoln.

DURING the recent heavy gales, the leaden roof of the Banqueting Hall, Whitehall, now housing the Royal United Service Institution, was rolled up like paper.

The foundation-stones of a new Sunday school, in connection with Richmond Hill Wesleyan Chapel, Leeds, were laid last week. The cost of the new building will be £2,800.

An enquiry has been held relative to the County Council's application for sanction to borrow £127,280 for the provision of a West Sussex County Lunatic Asylum. The conditional contract with Messrs. Longley, of Crawley, for erection of the building has been approved by the Secretary of State.

The London County Council have granted, as a loan, £2,600 to the Fulham Library Commissioners to defray the cost of erecting a branch library in Wandsworth-road.

Plans prepared by Mr. H. J. Snell, architect, Plymouth, for the extension of the Laira School premises, Egg Buckland, have been approved by the School Board.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the work.

BRADFORD, YORKS.—For the erection of a warehouse, Clifton-street, Manningham-lane, Messrs. Empsall and Clarkson, architects, 55, Tyrrer-street, Bradford:—
Booth, C., and Sons, Bradford, masonry ...
Deacon, J., Shipley, joinery ...
Taylor and Parsons, Bradford, ironwork ... £3,000
Wood, Job, Bradford, plumbing ...
Taylor, A., Eccleshill, plastering ...
Nelson, T., Bradford, slating ...

COMPETITIONS. TO ARCHITECTS.

DESIGNS and ESTIMATES are invited by Mr. N. MILLER, of 95, Fishergate, Preston, Lancashire, for a proposed fireproof block of Shops, Offices, two fully-licensed Houses, &c., cost not to exceed £50,000, on an area of about 2,500 square yards.

Premiums of £150, £100 and £50 are offered (in the adjudged order of merit) for the three designs which are selected as the most suitable, and which three designs will become the absolute property of Mr. MILLER.

The assessor to be an architect of eminence, and familiar with commercial property.

A plan of the site, with instructions to Architects, can be obtained from Mr. MILLER, on payment of £1 is., which will be returned to those sending in bona-fide designs.

All drawings, plans, sections, &c., must be sent to the Borough Engineer's Office, Town Hall, Preston, the name and address of the designer to be in a sealed envelope, enclosed with plans, &c., which will be respectively numbered, but no name, device or motto must be visible on wrapper. The plans must be sent in not later than May 27, 1895.

TO ARCHITECTS.

The Managers of the Llanelly Intermediate and Technical Schools are desirous of obtaining, by competition, PLANS (with Elevations), accompanied by Specifications and Estimates, for their proposed schools.

Particulars, conditions, and plan of the site may be obtained from the undersigned on payment of £1 is., which will be returned to each applicant submitting a design.

Drawings, &c., to be sent in by May 15th, 1895.

FRED. NELSON POWELL, Clerk.

TO ARCHITECTS and SURVEYORS.

Plans, &c., are required for a Ladies' College, to be built within ten miles of King's Cross.

The architect and surveyor whose plans are accepted will be engaged to superintend the erection of the building upon the usual scale terms.

Architects wishing to submit plans, &c., for approval may apply for particulars on Wednesday, April 3, between the hours of 10 a.m. and 5 p.m., at Parkfield Ladies' College, High Barnet, London, N.

TO SANITARY ENGINEERS.

The Parochial Committee of Great Ayton offer a PREMIUM OF TWENTY-FIVE GUINEAS for such SCHEME as shall, in the opinion of the Committee, meet their requirements for the drainage of the village and disposal of sewage, including plans, sections, estimate, and report. For particulars apply to the Clerk:—

JOHN DIXON.

Great Ayton R.S.O., Yorkshire.

CONTRACTS OPEN.

TO BUILDERS AND CONTRACTORS. The London County Council is prepared to receive TENDERS for ERECTING ONE TIMBER SHELTER at Clissold Park and Two at North Woolwich Gardens.

Persons desiring to submit Tenders may inspect the drawings and obtain the specification, bills of quantities, form of Tender, and other particulars at the Architect's Department, County Hall, Spring Gardens, S.W., upon payment of the

sum of Ten Shillings. This amount will, after the Council or its Committee has come to a decision upon the Tenders received, but not before, be returned to the tenderer, provided he shall have sent in a bona-fide tender, and shall not have withdrawn the same.

Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Tenders are to be delivered at the County Hall in a sealed cover, addressed to the Clerk of the London County Council, and marked "Tender for Park Shelters."

No tender will be received after TEN a.m. on TUESDAY, the 23rd day of APRIL. Any Tender which does not comply with the printed instructions for Tender may be rejected.

The Council does not bind itself to accept the lowest or any Tender, and it will not accept the Tender of any person or firm who shall on any previous occasion have withdrawn a Tender after the same has been opened, unless the reasons for the withdrawal were satisfactory to the Council.

H. DE LA HOOKE,

Clerk of the Council.

Spring Gardens, S.W., March 27, 1895.

CARDIFF GAS - LIGHT AND COKE COMPANY.

TO BUILDERS AND CONTRACTORS.

The Directors of the above Company are prepared to receive TENDERS for the RECONSTRUCTION of the Company's OFFICES and SHOWROOMS, Bute-street, Cardiff.

Plans and specifications may be inspected, also forms of Tenders, and bills of Quantities obtained on application to Mr. HENRY MORLEY, Engineer, Gas Works, Cardiff, upon payment of Two Guineas, which will be returned on receipt of a bona-fide Tender.

The contracting party will be required to provide two sureties to the amount of £500 each.

Sealed Tenders, endorsed "New Offices," and addressed to the Chairman of the Company, must be delivered to the undersigned not later than TWELVE o'clock noon, on FRIDAY, APRIL 5th, 1895.

The Directors do not bind themselves to accept the lowest or any Tender.

Gas Offices, By order,
Bute-terrace, Cardiff, G. CLARRY,
March 16th, 1895. Secretary.

BUILDERS desirous of TENDERING for BUILDING a small BLOCK of FLATS in Bloomsbury, are requested to apply to ERNEST J. W. HIDER, Architect, 118, Southampton Row, W.C.

SMOKEY CHIMNEYS & DEFECTIVE VENTILATION.

THE "DULCE DOMUM" CHIMNEY TOPS & VENTILATORS (Downes' Patent).

The only Chimney Top which can be Easily Swept with the Ordinary Apparatus without being damaged. A Positive Preventative of Down-Draught, so Constructed that it Creates a Continuous and Powerful Up-Draught. Simple in Construction having No Movable Parts, Nothing to Oil or Repair. Cannot Get Out of Order. Strongly Made in Galvanised Iron. Once Fixed will Last for Years. Applicable also for Ventilating Public Buildings, &c.

Builders, &c., testimonials can be seen and prices obtained at the Patentee's Office:—

Small Dwellings Wanted!

DOES the builder always know what to build? A good many people have begun to doubt it, for building has become so much a matter of fashion that the moment an enterprising speculator puts up a little novelty or quasi-novelty in domestic architecture, the trade rushes and ruins the idea. Disused brick-yards and suburban sites grow into prospective gold fields,—so general is the scramble,—and the crash is almost equally inevitable. Take what we may describe as Flat Fever. A little while ago the builder could not soar high enough towards heaven. We have been guilty of encouraging the bungalow, which is a lowly and more earthly thing, and perhaps our view is limited, but we do know that these flats tower aloft even in "undesirable" neighbourhoods, with the result that you may have the privilege of gazing down on your neighbours' back yards. It is all very interesting, no doubt—the general squalor of a London back—but we prefer to take a shorter view of life, and so we have some sympathy with the people who are writing to the daily papers complaining of their inability to obtain a nice little—that is to say, a comfortable, reasonably rented—house. We are prone to bar the Bijou Residence and the Cottage Ornée, for these remind us of a Doll's House and curiously of Ibsen's "Master Builder." In parenthesis, we might point out that the "Master Builder" was mad, but his British prototype is, at his best, a sane, shrewd, satisfying creature. It is only when he becomes speculative that he runs to seed—and bankruptcy. Two widely distant and distinct demands for small dwellings were voiced last week, one in a little manufacturing town away in Yorkshire, where a firm of manufacturers complain of an insufficiency of houses for their workpeople, and the other in the London Press, the latter the more suggestive in remedy. As a rule the builder keeps a pretty close eye on the manufacturer and is ever prepared, upon

reasonable evidence, to run up rows of cottage property. In London, on the other hand, the small professional man is more and more beset with difficulties in his endeavour to find the house at once agreeable to his liking and to his purse. As a correspondent points out, flats are now so dear—where happily or conveniently placed—and have such a limited number of rooms, that they do not meet the want. Yet, all the time, there are hundreds of good-sized houses empty. You have only to go through the roads in West Kensington and South Kensington to see the number of fine houses to let. Why should not some bold-spirited landlord try the policy of dividing a house in sets of chambers? The great black signs with their white letters of woe—To Let on Lease, For Sale—are hideous enough and

smash by Balfour's appearance in the dock, beyond the moral restitution, but the terror of his example should serve to deter men prone to gamble with the hard cash savings of others in gigantic schemes. Nor are we going to dwell upon the even more darksome end of Oscar Wilde. We note that many journals have already begun to refer to him as "the man Wilde." So it was with J. Spencer Balfour; the flatterers who fed and fauned the man, the partisans who had regarded him as a pillar in the Liberation movement, suddenly remembered that his name was Jabez, and "Jabez" it became. It is a cheap way of showing contempt, and one, in neither case, commensurate with the crime. We have little regard for the jerky and parrot-like condemnations of the Journals that fed Wilde's vanity, quoted his cheap insincerities and generally bolstered up his spurious fame. The parading and paraphrasing of this and that *poseur* in Literature, Art and the Drama have become the very curse of artistic life, and those that encouraged Oscar Wilde in his audacious mendacities should reckon up with their own conscience to-day. But what we are glad and thankful of is that Oscar Wilde's fall has struck a blow for the loftier ideals of Art. The proceedings at Old Bailey will not have been in vain if the public

THE TEMPLE OF NEPTUNE AT PÆSTUM.

have become a positive plague to the eye in many streets in the West End.

The Morality of Art.

It is a tragic coincidence that the two men most prominently before the public last week should be men who had the audacity to associate themselves with Beauty in Art and the Art of Building. We shall not go over the Balfour case, beyond saying that if there be any power in the arm of Justice, that man should be punished. Tardy, indeed, has been his home coming, and reluctant to-day as ever, taking advantage of every quip and quirk to dally with departure. Yet it is good to know there is strength enough in English law to bring Balfour back across the far seas that have meant safety so long. No restitution may result to the sufferers in the Liberator

has undergone an awakening to the pernicious philosophies and saturnalian sagacities that have been sapping the honest growth of English effort in all the Arts. Long ago, it seems, since the inane and vapid craze of sunflower worship took a crazy section of society by storm. For ourselves we are not staggered by the end, an end whose climax is a green carnation and a blasted reputation in the dock. It would be idle to deny that these creeds and crazes did not contaminate the Art side of things. Architecture took a cue and pandered to *Æsthetics*; in domestic decoration we had the grotesque thrust upon us; there arose faint odorous murmurs also of new Cults and Schools. Happily a Cult is not synonymous with Culture, and the solid public is yet wary of the New Moralities that have been preached in and out of season the last few years. We trust that irrespon-

sible Immoralists will either be galvanized into a healthier standpoint by this utter and startling collapse of Oscar Wilde, or will receive so serious a shock that the World may neither see nor hear them more. *Anything* will not pass muster for Art in England, tawdry success to the contrary, and there is still hope for the robust Arts and Letters that have been emasculated in the exotic heats and atmospheres of recent tendencies. Art can be moral and beautiful. Let us have done with the despicable doctrine that asserts Art to be, of necessity, immoral.

No Dinner and some Decoration. SHOULD Freemasonry forego its banquets for one year in order that St. Paul's Cathedral may benefit in decoration? The proposal is a bold one, and Mr. Woodward, architect, is responsible for it. We are a little amazed at Mr. Woodward's audacity, though we do not hold banquets to be the chief bulwark of Masonry. The representations of unfed outsiders to that effect may be taken at a heavy discount. Freemasonry does believe in the flesh-pots of this World, it is true, and so do all healthy bodied and wholesome minded men. Rob friendship of the hearty beefsteak, or the dainty *entrée*, and you have a cold, colourless intercourse, devoid of comradeship, with a tendency to pernicious nips, vile cigars and cheap drinks. So much, therefore, in appreciation of Freemasonry's substantial board. Whether it is necessary to strike a blow at the banquets at all, is a moot point, for Masons are, avowedly, a rich lot and not ashamed to own it. The Grand Superintendent of Works (not at St. Paul's), wrote to the London *Standard* yesterday, asserting that Masons would, he felt sure, be willing to associate themselves with the work of decorating "the finest Protestant Cathedral in the World," without going into annual fasting. In the Grand Superintendent's opinion, Mr. Woodward's suggestion was calculated to "give those outside the Order an erroneous impression that Freemasonry exists and flourishes upon such gastronomical and baser influences!" We admit the gastronomy but question the baseness. Is not a mere man—let alone a Mason—more open to attack, more ready with true deed, after he has dined? It has been said that a good cook is responsible for many good Christians, and Freemasonry is only another name for Brotherhood. Any way—and by whatever means—it will be a good thing if Freemasonry becomes associated with the decorative work of St. Paul's, and there would be something peculiarly fitting in this relationship of Masonry to Wren's masterpiece. In 1666, Wren was appointed Deputy Grand Master under Earl Rivers, and distinguished himself beyond any of his predecessors in legislating for and promoting the success of the lodges under his care. He was Master of the St. Paul's Lodge—now the Lodge of Antiquity—(of which the Duke of Sussex was a Past Master) and attended their meetings regularly for upwards of eighteen years. In 1685 he was elected Grand Master. These facts will appeal, we are sure, to the hearts and the pockets of Masons without any need of their being sent forth, upon Lodge nights, empty away.

THE GREEK TEMPLE AT PÆSTUM.

THE Temple of Neptune, at Pæstum, is said to be the most perfectly preserved Greek Temple in the World. It is sixty-three yards long and twenty-eight yards wide. At each end are six massive fluted columns, at each side twelve. Built of yellow travertine it has a deliciously soft mellow colour. All its proportions are delicately balanced and serenely harmonious. Once the scene of august ceremonies and brilliant life, it is to-day empty, abandoned, silent.

THE NEW CHAPTER HOUSE OF DURHAM CATHEDRAL.

INTERESTING DISCOVERY OF THE REMAINS OF THE GREAT APSE.

EARLY in June the new Chapter House in Durham Cathedral will be opened. The Chapter House has been built as a memorial to the late Bishop Lightfoot, by subscription. It is expected that an important Commemoration Service will be held. The work has been carried out from plans by and under the supervision of Mr. C. Hodgson Fowler, F.S.A., of Durham, by masons under the superintendence of the foreman, Mr. Ashley, there being no contract (except for wood and lead-work of roof, done by Messrs. F. Caldcleugh and J. Newby, of Durham, respectively). The cost has been between £5,000 and £6,000. The Chapter House, in its original state, was a very fine Norman building, completed 1133-1140, but the eastern half, under the direction of Wyatt, who considered it in a ruinous state, was, in 1796, pulled down and the remainder made into a square room with a flat ceiling. The keystones were taken out of the groined roof and the roof allowed to fall on to the floor, which, being formed mainly of grave-stones, was seriously damaged. The present work has been the restoration of the eastern half and the replacing of the groined roof over the whole building, the whole being covered by a flat-pitched deal roof covered with lead. The plan of the Chapter House is in the form of a parallelogram having a semicircular apsidal end, the internal dimensions being: width above wall arcade (Norman intersecting arches) 36 ft.; total length 78 ft., the apse being 18 ft. radius; height from floor to spring of groin 22 ft., ditto to apex of groin 43 ft.; the walls are 5 ft. thick; the groin-ribs are both plain and zigzagged with figure corbels to apse; the haunches of the groins have been filled with concrete. The Chapter House is lighted by seven Norman windows glazed in geometrical patterns. New carved oak doors have been inserted in the large west doorway, and a stone dais placed all round the inside. There will be placed in its original position at the east end a bishop's chair, which was discovered in the foundations of the 1796 wall. This chair was used from 1140 to 1791. Old groin ribs, window jambs, and other fragments and remains were found in the foundations, so that an exact restoration was possible.

The excavations which have just been carried out in the Cathedral have thrown light on the question of the exact form of the east end of the choir, as built by Bishop Carileph, in 1093. That the choir ended in an apse has always been known, but this apse, owing to some failure, threatened to become ruinous some hundred years after its completion, and was, with the east ends of the choir aisles, wholly removed when the eastern transept, or Chapel of the Nine Altars, was built in the second half of the 13th century. It has hitherto been thought by antiquarian authorities that the aisles were carried round the central apse to form an ambulatory, the usual plan in the great Norman churches of England; but the portions of the old terminations laid bare show clearly that the aisles ended square externally in a line with the chord of the great apse. Not only the foundation of the central apse has been discovered, but a part of the internal walling, including the square block on which stood a cluster of vaulting shafts, and one base of the wall arcade under the windows, exactly corresponding with the work now existing in the choir aisles. Besides the foundations of the square end of each aisle, those of a smaller apse have been found on each side. If these belong to Carileph's church, his aisles must have had an apsidal end internally, but certain indications have

led to the theory that these side apses belong to the Saxon Cathedral which preceded the Norman one and occupied the same site. It is hoped that further investigation may settle this point. The floor must shortly be relaid; but arrangements will be made by which all points of interest may still be accessible.

PICTURES IN WHITECHAPEL.

MR. MUNDELLA SPEAKS UP FOR THE NATIONAL GALLERY.

THE idea of showing the best pictures to the poor no longer seemed absurd, said Canon Barnett, at the opening of the 15th Annual Whitechapel Fine Art Exhibition. It did not raise a laugh as it did fifteen years ago, when he proposed to show the works of the best artists to those who were among the poorest and most ignorant. The human spirit had another victory. It was now recognised that if the wealthy got knowledge and joy by such means, the poor—being human, too—would also learn to live better by admiring what was beautiful. The poor—who were the majority—must learn to care for art if art was to survive for the service of the commonwealth. Mr. Mundella, who opened the Exhibition, said the work in regard to these picture exhibitions, which was started in Whitechapel fifteen years ago, had been extended to many other parts of the metropolis. He could not claim to be either an artist or a critic. He was only a plain man of business, and a man who in the turmoil of business had found in art the greatest solace, pleasure and instruction. Art had been to him the delight of his life from his youth, and it was increasingly so with increasing years. The place of art was of the utmost importance in relation to the everyday life of busy men. Contrasting the conditions and habits of the people of this country at the present time with those of three-quarters of a century ago, he claimed that much of the improvement was due to the influence of art, and that influence, which elevated and refined, was now brought to the very doors of the poor. Speaking of the establishment and history of the National Gallery, he commended to all those who visited European galleries the suggestion that immediately on their return they should visit their own National Gallery, and they would assuredly, he thought, admit that there was none so truly representative and none so free from mediocre pictures. He thought there was no gallery in the world where the pictures on the whole were of such high level as those of the British National Gallery.

THE new asylum which the Herts County Council propose to erect at St. Albans is to be constructed to accommodate 560 patients, instead of 400 as originally proposed, at an estimated additional cost of £15,000. The total cost is estimated at between £90,000 and £100,000.

THE interesting old gateway at Calais—at one time the principal entrance to the town—known as the Porte de Havre, is now being demolished, the site being required for a boulevard which is being made across the north side of the town, as a part of the extensive scheme for the naval and commercial harbour and other improvements being carried out at this port. The gateway was erected by Cardinal Richelieu in 1633, and has a drawbridge and portcullis.

THE new pier at Rhos-on-Sea is to be opened for promenade purposes during the Easter holidays. The pier, which starts from a point near the ancient fishing weir at Rhos, is a substantial structure of iron, about 1,400 feet long, and the cost of construction has exceeded £10,000. A scheme is on foot for connecting Rhos-on-Sea with Llandudno and Colwyn Bay by means of an electric tramway.

THE Church of St. John's, Egremont, has just had a new beautifully carved oak altar, designed by Messrs. Norbury, Paterson and Co., placed in memory of Miss Millett. The table is a gift.

THE INSTITUTE AND THE A.A.

WE do not wish to take from the merry little *A.A. Notes* the privilege of discussing the merits or demerits of the Institute Examinations, nor do we wish to gather unfairly to our columns the feverish communications which the opposite partisans politely fling at one another once a month within the little brown covers of the official organ of the Architectural Association. It would be a pity to rob our little contemporary of its charm, by taking it seriously, and we should be sorry to think that Mr. William White and his followers on the one hand, were more in earnest than Mr. Leonard Stokes and his followers on the other, so we can best serve the interests of our own subscribers by dropping all these factions and influences overboard, and by filtering the matter through the authority of our own opinion. We will begin by divulging a little "trade" secret. We have already published or prepared for publication, twelve "Men who Build," and, curiously enough, each of the twelve has given it as his opinion that you cannot determine the architectural competence of a man by examination. As to the definite value of the Institute Examinations the opinions of the twelve good men and true were about balanced, but all agreed that the examinations could do no harm. Three of the "men" frankly asserted that Fellowship of the Institute was of no earthly value to a practitioner; two did not think it was worth considering whether it was or not; seven thought generally that architects should become members, if they were able, if only for their own dignity and the dignity of their profession. But here come a most astounding fact—and one the responsibility of which we take upon ourselves, for we did not in any case obtain the fact by a direct question—the greater number believe the Architectural Association has done more legitimate good for architecture than any other professional Institution in England. Mr. Leonard Stokes will find unction in that.

We have no faith in the Angel of Destruction; our pet spirit is the Spirit of Advancement. We love the new because we reverence the old; we build up because we have no heart to pull down. The Royal Institute of British Architects is, perhaps, the most imperfectly manipulated Institution of its kind. It has upon it the thumb marks of two, or, perhaps, three men who by no means should have a tenth part of the power they appear to have. The influence should come from a body of men, powerful in resource, keen of perception, unflinching in determination; and there is very little of these things in Conduit Street. There are, however, cliques in the Institute, and the quicker the profession faces the fact and acts in wisdom's way the better.

The particular difference which, since the beginning of the year, has been agitating the minds of various correspondents in the *A.A. Notes*, is whether the examinations at the Institute are not sapping the educative faculties of the A.A., and, therefore, doing an irreparable injury to the minor body. We cannot ourselves see that the inference is proved. Mr. Stokes—in a letter in the current issue—says:—"In 1882 the Institute established its various examinations and almost immediately afterwards the Association found all its own classes practically abandoned . . . Twice within about ten years these Examiners ('Mr. Cates and his Brood'), have checkmated the Association in its attempt to train the young architect, and what will happen this time I cannot quite see." On the other hand, Mr. Phené Spiers—who in the March issue of the *Notes* answered another of Mr. Stokes' fireballs which appeared in the February number—says: "Were the Architectural Examinations

(of the Institute) to be suddenly stopped, within two or three years the Association would be wound up." What leads Mr. Spiers to this romantic conclusion? It is altogether ridiculous. In a private communication—a reply from a worthy correspondent to whom we referred several matters of fact—which is now before us, the writer says: "The subject is, perhaps, rather stale, but it must come to the front again now that the A.A. cannot work its 'New Scheme' as we call it—i.e., we cannot get the students to come to the classes and studios in any numbers. Mr. Lacy W. Ridge, the other day, was to have commenced a series of lectures on 'Professional Practice,' and not a single student could be found to attend them; and, on another subject, so good a man as F. R. Farrow lectures to one man. Of course, all this may be the fault of the classes and the A.A., but nobody has said so, or even hinted it, and I maintain, with Stokes, that (in the absence of any other evidence or theory) the Institute Exams. are to blame." All this is probable, but, as yet, there is no atom of proof, and we have a wonderful liking for proof. Between now and the appearance of our next issue

tions, and its papers, without being able to muster up one single little editorial comment, one way or the other—the Royal Institute of British Architects has but the merest misty existence. Nineteen educated men out of twenty have never heard of it. Thirty per cent. of the ablest architects, to their eternal shame be it said, don't recognise it. The Government of the country ignores it, and fifty per cent. of its members never go near it. And, as if to add insult to ignominy, it cannot even afford to house itself respectably. It appears to us that the place is covered with the dust of a sham respectability that wants ruthlessly sweeping away. We almost hunger for the "job."

(To be continued.)

LIGHTNING-RODS.

THE general principles to be kept in view in the application of lightning-rods are these: the rod should be made of the best conducting substance; it should be continuous, and have great electrical capacity, and the metal of which it is composed should expose as great an extent of

HEYWOOD MUNICIPAL TECHNICAL SCHOOL: MESSRS. WOODHOUSE AND WILLOUGHBY, ARCHITECTS.

we will endeavour to collect a little. In one of our pigeon holes, neatly tied up with red tape of a very brilliant colour, is a mass of facts connected with the Institute. The time has come when the higher elements of architecture should be more strongly represented on the Council. And we are bound to say that, with few exceptions, the higher elements are to be found with the new school. We should like to see Ernest George, John Belcher, Brydon, Graham, Carey, Mountford, Stokes, and others like them, on the front benches. It might be very shocking to some of the grey beards of Conduit Street to see several of these "new" men to the fore, but how the pretty faced Goddess of Architecture would smile with delight. Who knows but that, if this were so, the men who now walk past the doors of the Institute, without so much as a glance of recognition, would peep in, and presently enhance its dignity by membership. It is monstrous for men to raise a voice against the existence of the recognised Institution of their profession. The Institute fails in mighty measure. Beyond its own members and outside the professional press—which year after year reports verbatim its transac-

surface as possible, consistently with strength and durability. Its upper extremity, which should project freely into the air, should be pointed, and may be triangular, somewhat similar to a bayonet. In cases where metallic vane-spindles or other points exist, it may commence from these. It should be led as directly as possible along the building, and be fixed to its walls. It should terminate immediately under the surface of the ground in two or more branches, passing out in any convenient direction; these branches should, if circumstances permit, be connected with a spring of water, a drain, or some other conducting channel. It should be applied immediately to the part to be defended, and not at a short distance from it, and should be so applied that a discharge of lightning falling on the general mass could not possibly find its way to the ground by any circuit of which the conductor did not form a part; that is to say, the conductor should be united with all the great masses of metal in its vicinity which offer other possible lines of discharge: by this arrangement no more of the discharge could pass in the direction of such masses than could be transmitted without damage.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
9th April, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

THE operations this year in the Test Work for the Unemployed are not at present at Abbey Mills, where the remaining work can be done at any time, but at Lower Sydenham, where the employment is of a more urgent character. There the London County Council have obtained a lease of ten acres of land, formerly a brickfield, which they propose levelling and raising, with a view to letting them out as working men's allotments. The land is contiguous to the gas works, and is surrounded by a population suitable for such a scheme. A number of applications for allotments have already been received—in fact, far beyond the number of tenants the land will accommodate. The work is admirably suited for the Committee's purpose, providing good stiff digging, wheeling, and road-making. The terms of employment for the men engaged are 6d. per hour for eight hours daily. Each man helped by the Committee in the purchase of stock or plant leaves 1s. per day in their hands towards the scheme for his benefit. The men employed are doing very well this year, being a better class—taking them all round. Something may yet come of the experiment.

"RESTORATION" is, in the opinion of some alarmists, threatening Peterborough Cathedral. Mr. William Morris, in his letter to the Press, which we print elsewhere, raises a warning voice. Mr. Morris pleads that "every device which skill and knowledge can suggest shall be exhausted before rebuilding be even thought of," and that "as little disturbance of the surface of the building shall take place as is possible, and that consequently no merely decorative features shall be reproduced in imitation of the old work." This is not the first time that he has drawn attention to the condition of the Cathedral. Writing five years ago, when it was rumoured that the west front was to be repaired, he said that it was in excellent repair, and that even if structurally unsound it could be saved without rebuilding. He also asked the very pertinent question: "Before we give our money to the Restoration Committee, who is to assure us of the truth as to the stability of this great work of art?" In the case of this "magnificent portico of Early Pointed work . . . unique in this country, a miracle of grace and beauty," there is perhaps little reason to fear that the Cathedral authorities will be over ambitious. The Cathedral authorities have not only to preserve their building, but to set a good example to others similarly situated. If the west front can be repaired it must be done with reverence.

Is not this a record? The North British Railway line, which terminates at present at Clydebank, is being extended to join the

main line at Dalmuir. The extension passes under the main line a short distance to the east of Dalmuir Station, and, the other Sunday, within the short space of twenty hours, the embankment was cut through, a concrete arch erected, and the permanent way restored to its normal condition for traffic. At two o'clock on the Sunday morning 200 men were started on the work, and as it was impossible in the limited space for all the men to be engaged at once, they worked in relays. The work done between two a.m. and 10 p.m. on Sunday embraced the handling of over 2,000 tons of material. The embankment was dug through to the extent of 36 feet in breadth and length, and to a depth of 15 feet. In six hours 600 cubic yards of earth were excavated. A centre was then formed on the earthwork, and about 190 cubic yards of concrete were laid to form the arch, after which the earth was filled in and the line restored. And after this it is stated that the workmen had two hours to spare!

At the Sheffield School of Art Dr. H. C. Sorby, F.R.S., recently lectured on the "History of Some of the Animal Forms met with in Early Art." Dr. Sorby described the development of scorpions, cockatrices, snakes, sphinxes, hawks, lions, centaurs, griffins, and dragons, through the periods of Egyptian, Chaldean, Assyrian, Greek, Byzantine, and Norman Art into mediæval times. The lantern slides, many of them drawn from originals by Dr. Sorby himself, represented examples at the British Museum, Orford, Worcester, Malvern, Beverley, and York. The whole lecture might be described as dealing with the ancestry of ornament.

THE superb cross at Stourhead, originally erected in the College Green of Bristol in 1373, has just been restored by Sir Henry Hoare, to whose ancestor it was presented after it had been ignominiously pulled down by the Bristol citizens. The cross is no less than fifty feet high, and its niches are filled with several royal figures. This work has been accomplished as a memorial of the late Sir Henry Hoare, over whose grave a coped slab of the finest Sicilian marble has now been placed. The restoration of this unique mediæval monument occupied a large band of skilled statuary continuously during more than six months.

THE great ordnance survey map of England will be shortly issued. It has taken just 20 years to complete, and the total cost will, it is stated, exceed £4,000,000. The map will consist of some 180,000 odd sheets. In these the scales vary from ten to five feet to the mile for the towns, and from twenty-five inches to one-tenth of an inch for the country. In the former the details are so minute that not only the exact shape of every building, but every porch, lamp-post and fire-plug are shown, whilst in the 25-inch map for the country every hedge, fence, ditch or well is recorded.

It will not be long before the extension of the Record Office in Chancery Lane is ready for its precious charge of State documents and national archives, for the scaffolding which for so long has surrounded it is rapidly being taken down, and only the ground-floor is still hidden from public view. The narrow thoroughfare affords but scant opportunity of obtaining a full view of the fine façade; but, standing at the extreme end of the Incorporated Law Society's buildings, the spectator will have a good opportunity to survey the massive architecture of the new building opposite. The edifice is composed almost throughout of Portland stone, which, in addition to being picturesque, has the solidity which is demanded by a structure of such importance. The towers at each end form a relief to the frontage,

while in the centre, over the main entrance, there is some artistic moulding, and on the highest point there is a striking balustrade, surmounted by the Royal Arms.

THE usual animation in Art quarters was manifest on "Show Sunday," which, despite all that has been said in its disparagement, continues one of the most popular of the art functions of the year. Crowded studios were the rule, and fashionable visitors scanned in the customary superficial fashion the works on the easels. To what extent the artist is benefited by this sort of patronage it would be difficult to discover. It is doubtful whether a picture was ever sold through the medium of a "Show Sunday" view, and certainly a reputation was never made through its agency. Artists are, however, presumably at least, the best judges of their own interests, and if it pleases them to surround themselves once in the year with a crowd of well-dressed nonentities, it is not for others to say them nay.

A BEAUTIFUL and interesting bas-relief in terra-cotta, of the Virgin and Child, which by competent experts is attributed to Andrea del Verrocchio, who, according to Vasari, "was a goldsmith, sculptor, carver, painter, and musician," has been acquired by the Birmingham Art Gallery. This work is an excellent example of his skill, and will form a pleasing pendant to the Della Robbia bas-relief of a similar subject in the Italian Gallery. The Committee has also purchased the fine reproductions by the Berlin Photographic Company of the celebrated "Meyer Madonna," by Holbein, at Darmstadt, and the collection of reproductions of Rembrandt's pictures in the famous gallery at Cassel. The collection at Cassel was formed by the Elector, who, when nobody cared for art, in 1730 to 1750, went systematically to work in Holland collecting Dutch pictures. He gathered together no less than forty Rembrandts of the highest importance. Some of the finest were carried off by the French at the end of the century, and never went back; but some twenty-eight are left, and of these the best seventeen have now been carefully reproduced in photogravure.

A SHAFT in the earth is to be the chief attraction at the next Paris Exhibition, some particulars of which we gave in our last number. Mr. Paschal Grousset, whose the idea is, says that the descent will at once fascinate the public and enable scientists to see how hot it gets as they go down. He does not propose to risk too much for the satisfaction of the latter. The diggers will desist at a depth of 4,500 feet, where the heat, it is thought, will be at least tropical; and at this point borers will take up the investigation, in the hope of finding "a new source of light, heat and power." At various stages of the descent there will be galleries decorated to match the climates, and furnished with suitable refreshments. This romantic idea will pique the curiosity and revive the good humour of all Paris, but it will cost, even on M. Grousset's reckoning, half-a-million sterling, which is two and a half times the estimate for the Eiffel Tower.

It has been repeatedly demonstrated that Whitechapel, than which there is no more maligned district of London, includes among its inhabitants a large number who are appreciative of art. Canon Barnett had, therefore, ground for the hope he expressed, on the occasion of the opening by Mr. A. J. Mundella, M.P., of the annual Exhibition of Fine Art in St. Jude's Schools, that a donor would be found ere long to build a museum, in which such rare paintings as are here found can be displayed to the best advantage. About £20,000 would be required for that

purpose, and the institution, at which two exhibitions might be held yearly, could be maintained under the Libraries and Museums Act by the local authority.

SIR JOHN TENNIEL'S exhibition of pencil and pen and ink drawings at the Fine Art Society's Galleries is drawing a "crowd." They are the originals of work that has appeared from time to time in *Punch*, but the collection by no means covers all Sir John's contributions to that periodical. Too many were executed on the block itself, and so have perished, you may say, in multiplying copies of themselves. Sir John Tenniel is a born illustrator, one who gets a grip of the humour or pathos of a subject and never lets go. He troubles less about general effect than about the clearness of every necessary or explanatory detail in his subject. It is his setting of the scene, his choice of *mise-en-scène* in fact, that gives virtue to his pictures, rather than the quality of his line as decoration or the sureness of his eye in realising character and the structure of forms. One seldom feels excited or exalted by his dry, uniform technique, but one is always amused or touched, as the case may be, by the aptness of his adaptation of an incident to humorous or pathetic ends.

THERE would seem to be an aristocracy in Labour already, and "Movement" now means so many different things. Mr. John Burns ought to know something about "Movement," and it is remarkable, therefore, that he should admit one of the gravest objections that persons who are not "democrats" make to the "Labour member." Speaking at Battersea he said there was a tendency to regard a "working-man member" simply as a person who went to the House of Commons to do jobs for the people who sent him: "These people seem to regard their member as a mere instrument for bringing work into the district, and the House of Commons as a great log-rolling centre for industrial purposes. On that platform was a man, Mr. Will Crooks, whose life had been threatened by an angry mob in the East-end because he had refused to consent to grant indiscriminate outdoor relief as a Poor Law guardian. If this tendency were allowed to continue," said Mr. Burns, "Parliament would become as pernicious and corrupt as that of America." Then America is not exactly the Home of the Free? As "pernicious and corrupt as" the leading Republic of the World is certainly an "Honest John" admission!

THE papers to be read at the first four Wednesday meetings of the Society of Arts after Easter are as follows: "The Use of Electricity for Cooking and Heating," by Mr. R. E. Crompton; "Deviations of the Compass," by Professor A. W. Reinold; "The Extraction of the Rarer Metals from their Oxides," by Professor William Chandler Roberts-Austen, C.B.; and "Means for Miti-

gating the Fading of Pigments," by Captain W. de W. Abney, C.B.

THE Hospital Committee of the Urban District Council of Ilkley recommended, on Thursday, that the whole of the designs (submitted in response to a public invitation by the Council) be discarded, in consequence of the competitors having failed to submit plans sufficiently satisfactory without necessitating considerable alteration and additional outlay; also that plans be prepared for a hospital to accommodate sixteen patients, and that such buildings as can be completed by an expenditure of £3,000 be proceeded with after obtaining the sanction of the Local Government Board. This recommendation was adopted, and the Committee empowered to consult any of the original competitors as to the preparation of plans and terms.

A HANDSOME annexe to King's Cross, the Great Northern Railway terminus in London, has been built, to be called the "local station," and was opened for traffic on Thursday. In addition to three lines of rails, room

SALFORD SCHOOL BOARD OFFICES.

WOODHOUSE & WILLOUGHBY, ARCHITECTS.

has been found for two ample platforms—one of them an "island" platform—with the dimensions and general appearance of which it would be difficult even for a rival company to find fault. Each platform is 500 ft. long by 20 ft. wide, and the two, together with the three lines they serve, are covered with a roof constructed of Mellow's patent glazing in "ridge and furrow" spans, and presenting an exceedingly bright and handsome appearance. One of the new platforms communicates direct with the main station, but the general entrance for the public is practically the same as that to the suburban station, only that, in view of the increased traffic, the doorways have been enlarged, and new waiting rooms and additional circulating area provided. Moreover, a glazed roof of similar construction to that which covers the new station itself has been thrown over the cab road, thus providing a new covered area of over 12,000 feet for the shelter of passengers alighting from cab or carriage at the new station entrance. The new local station, like the rest of the King's Cross terminus, will be lighted by electricity.

MR. LIONEL CUST has been appointed Director of the National Portrait Gallery. He is a descendant of the first Earl Brownlow, and has been a member of the Civil Service since 1886—first in the War Office, and subsequently in the Department of Prints and Drawings at the British Museum.

AFTER all, and contradictions to the contrary, the Palais de l'Industrie in Paris is to disappear to make way for the approach to the future bridge connecting the Esplanade des Invalides Girdle Railway terminus with the Cours la Reine. The Palais de l'Industrie was built at a cost of nearly a million sterling to serve for the Universal Exhibition of 1855. It is an ugly, but most useful building, owing to the great space that could be devoted in it to paintings and sculptures. It opened a new era in French art. The keenness of the competition among artists to which it gave rise forced new schools into existence. It also fostered a mercantile spirit and a keen eye to existing and possible markets. A number of people have bestirred themselves to save the building. The only satisfaction they have met with is a promise that it will only be demolished piecemeal, and that three more art exhibitions can be held there.

FROM Scotland we hear of a species of telegraphic communication which, though not new to the scientific world, may fairly be described as marvellous. The cable between Oban and the Isle of Mull being out of order, messages have been transmitted across the water without any connecting apparatus whatever. This astounding result has been achieved by means of the well-known telegraphic phenomenon called induction. A wire is erected on the mainland opposite to and parallel with a portion of the telegraph line on the island. The message which it is desired

to communicate to Mull is transmitted over the wire on the mainland in the ordinary way. The signals thus transmitted pass at the same time over the parallel line in the Isle of Mull, and telegraphic operators there read them by means of a telephone. This fairy-like achievement of science is not by any means novel as an experiment, but we believe it is the first time it has been turned to account in the practical, everyday work of telegraphy.

EVEN a railway company occasionally deserves a good word. The London and South Western coped in a business-like way with the troublesome disaster at Guildford. The extemporised road service between Guildford Station and the Godalming mouth of the tunnel improved day by day. Covered sheds were erected at the temporary station by the tunnel, and hand-carts and waggons for the transport of luggage were freely supplied, and inconvenience and loss of time were reduced to a minimum. On the up journey, however, it was impossible to avoid some dislocation of trains. By the beginning

of last week trains were again running through the tunnel. The first train ran through from Guildford to Godalming, passing slowly through an army of workmen, and under a framework of timber, the commencement, apparently, of the arch of the tunnel.

THE Department of Science and Art has received, through the Foreign Office, a copy of a note from Her Majesty's Consul at the Piræus, relating to a permanent industrial exhibition which has been organised by the "Société Biotechnique" at Athens, to be officially opened on April 28. This exhibition, although intended only for native products, will be accessible to foreign exhibitors of such articles as may assist in the development of Grecian industries. All expenses connected with the exhibits will have to be paid by the exhibitors, who will, moreover, have to pay a tax of two drachmæ for each article worth 100 drachmæ. Articles worth more will be charged half a drachmæ per 100 in addition. The committee of the exhibition undertakes to sell the exhibits at a commission of 5 per cent. The exhibition will be open each year from March 13 (March 1 O.S.) to July 12 (June 30 O.S.), and from Sept. 27 (Sept. 15 O.S.) to Jan. 27 (Jan. 15 O.S.).

SHEFFIELD proposes to build a Physical College, somewhat on the Y.M.C.A. plan, but unconnected with religion or politics. The building will be of brick, with stone facings, and the ground floor will be divided into six shops. The entrance will be in Charles Street; at the top of 16 steps the inquiry office, telephone room, and a cycle stable capable of accommodating 100 machines. On the floor above there will be a gymnasium, 94 feet by 64 feet, the floor of which could be used as a full sized tennis court, and 12 feet from the floor a running track, which could be utilised as a balcony on the occasion of displays. Such a gymnasium will be second only to Liverpool, which is the finest in the kingdom. The cost of the land will be £6,474, the building £5,800, and the solicitors' and architects' fees, apparatus, and furnishing £1,500, making a total of £13,774, or £14,000 in round figures. Mr. H. W. Lockwood is to be the architect.

THERE is something characteristically French about the story of Marseilles and its monument, for the port has just erected a statue to the dead who yet live, and to the fallen who never fell. The town council resolved some time ago to set up a statue to the Gardes-Mobiles and the Francs-Tireurs of the Department Bouches du Rhône who fell in 1870, and a fine allegorical group soon rose in the Allée du Meilhan, representing France leading her sons to the battle. The Marseillais were delighted with the noble monument, but one detail failed, namely, the names of the fallen heroes to be engraved in gold on the pediment. Many, too many, had doubtless fallen, but their names were forgotten, and not a single son of Marseilles belonging distinctly to these regiments could be recorded. Yet the municipal council showed themselves equal to the emergency, and offered themselves as conscripts or candidates for "fallen" honours. "You want names," they said: "we give you our own." And so it has been done, for under the noble group of France and her sons going to the slaughter come the names of the victims, who are just the municipal councillors of Marseilles to-day!

THE "Izaak Walton Memorial Window," which has been placed in the church of St. Dunstan-in-the-West, Fleet Street, was unveiled on Friday by the Master of the Ironmongers' Company, of which Walton was a

member nearly three centuries ago. A marble tablet, giving some particulars about the famous angler, is also to be fixed on the outside wall of the church.

"THE economical lighting of public and private buildings, workshops," was the title of a paper read by Mr. John West, ex-president of the Gas Institute, at the meeting of the Manchester Association of Engineers. The Welsbach incandescent gas burner, regenerator burners, argand and other burners were shown in operation, and remarkable illustrations were given of what is possible in the way of securing a brilliant gas light at a minimum cost. Mr. West in his paper explained that the gas supplied throughout the United Kingdom varied in illuminating power from 12 to 28 candles. In many English provincial towns it ranged from 12 to 15 candles; in London it was 16½ candles; in Manchester and other places near the canal fields it ranged from 15 to 20 candles; and in Scotland it ranged as high as 28 candles. But in far too many cases the consumer did not get full advantage of the lighting power of the gas. About thirteen years ago he obtained a large number of the burners in ordinary use in Manchester, and found that the loss of illuminating power by their use came in most cases to over 30 per cent. He feared, from observations he had since made, that the loss was still going on. The best kinds of the ordinary burners were to be had cheap, and in order that there might not be undue pressure of the gas as it issued from the burner, resulting in imperfect combustion and consequent waste of light, he recommended that in private houses a regulator should be attached to each burner, or that what are known as governor burners should be used.

For lighting public and private buildings and workshops, he strongly recommended the incandescent gas burner, which he was using at his own works, with the result that he obtained at half the former cost four times more light. Alike in public and private buildings where general lighting was desired, he recommended that the chandelier or pendant should be placed in the centre of the building or room, as where brackets were used the walls absorbed a great quantity of the light. Comparing the cost of incandescent electric lighting with the cost of incandescent gas lighting, he stated that a 16-candle incandescent electric lamp in use 1,000 hours would absorb 60 units of electricity, which, at 6d. per Board of Trade unit, would come to 30s., whereas an incandescent gas burner consuming three cubic feet of gas per hour or 3,000 cubic feet in 1,000 hours, and giving a light equal to that of 60 candles or fully three times that of the electric light, would cost, with gas at Manchester at 2s. 3d. per 1,000 cubic feet, 6s. 9d.; at Maidstone, with gas at 2s. 4d. per 1,000, 7s.; and at Plymouth, with gas at 1s. 9d. per 1,000, 5s. 3d. He challenged the electricians to disprove these figures. This is a bold attitude. Electricians would do well to accept the challenge and prove, once for all, whether the electric light can or can not be made a commercial competitor of gas.

HOUSES Wanted! The demand is refreshing and it happens to be genuine, for, at the monthly meeting of the Burley-in-Wharfedale Urban District Council, a letter was read from Messrs. W. Fison & Co., of Greenholme Mills, in which they stated that they agreed with the medical officer of health as to the urgent need of more house accommodation in the village. The firm themselves were not disposed to meet the demand by erecting houses, but they should be willing to place

suitable land at the disposal of builders at a reasonable rate, and upon easy terms. We hope all builders will not speak at once.

WE think the inquiry of General de Courcy Scott into the complaints made against the Water Companies during the frost ought to result in something, but we are not hopeful. All "inquiries" seem to us to halt before they begin. But the Local Government Board has at last a chance of doing some really useful work for the community, and we hope it will use it. It is absurd to speak as the *Times* does of the recent frost being so very "exceptional." It was exceptionally long, and perhaps exceptionally severe; but the state of our water-pipes was not exceptional at all. Whenever there is anything of a frost, the water-supply in certain wide areas of London fails, just as it did this year. Now that "exceptional" hardship has compelled attention to what is a normal state of things, there may be a chance at last of providing that in future such things shall not occur more or less regularly every two years or so. The aroused attitude of the Local Government Board will not, we trust, prove a bit of a "frost." We have had "frost" enough.

NUDES and dreams will be in the ascendant, we are told, at the forthcoming Art shows. They are cold subjects for Spring, but a cursory look in at the outsiders' studios revealed the fact that nine-tenths of the pictures were designed for the gallery, not the dwelling-room; completeness of execution was the exception, and works costing less than three figures were altogether absent. Subject there was in plentiful variety, but more often than not of a distressing character. It would be appropriate to describe the show this year as the Academy of "Life and Death," more especially the latter. Sir John Millais's "Death of Stephen," Mr. John Collier's "Death of Albino," Mr. Gotch's "Death, the Bride," Mr. Dicksee's vision of a dead wife, and Mr. Lockhart Bogle's "Highland Funeral" are but a few instances which occur. Life in its plentitude of beauty will be typified by a display of nudities which English artists a decade ago would not have dared to put on canvas. Mr. Poynter will show a large picture in which there will be several; Mr. Normand has an equally important work, the title of which, "Bondage," almost explains the subject of the purchase by an Eastern potentate of occupants for his harem; Mr. Oliver has a nude of Juno and her Peacocks, and Mr. Walter Bayes a nude in the open.

AN early occupation of the new Sheffield Town Hall is hardly likely to be realised. Industrial disturbances—if one may so term the plasterers' strike—and the long spell of keen and nipping frost have done much to delay the work. The contractor, Mr. Edmund Gabbutt, has over 200 men at work. In the vestibule of the main entrance men are engaged on the six large ideal figures which the sculptor, Mr. Pomeroy, has moulded. They are reproducing the outlines in the rough for the sculptor and his assistants to finish with their more skilful hands. The chief of the outside adornments will naturally be the statue of Her Majesty, by Raggi, which, now that the screen of canvas has been removed, is visible in the niche high over the main entrance in Pinstone street. The giants' pediment of Thor and Vulcan, in heroic size, supporting the coat of arms will be, however, the most striking piece of sculpture. These have not yet been hoisted into position.

ACCUSTOMED to her Majesty's habit of employing German painters to execute Royal portraits, there is a certain sense of refresh-

ment in the knowledge that she has commissioned Mr. A. C. Cope to proceed to Berlin to paint for her a likeness of her grandson—the Emperor of Germany. Mr. Cope will be remembered as the artist whose portraits of Mr. Fowler, Mr. Mundella, and others in last year's Royal Academy, attracted much attention.

THE new Chairman of the County Council, Mr. Arthur Arnold, presided over the opening of the gardens known as Telegraph Hill at Hatcham, near New Cross, on Saturday afternoon. The idea of this important addition to London recreation grounds originated with Mr. George Livesey, who contributed to the fund £2,000. The Haberdashers' Company, from whom the property was purchased for £8,000, subscribed a like sum, as did the Greenwich District Board of Works, the remainder being voted by the London County Council. The two gardens cover altogether about ten acres. In commemoration of the event, and for the information of visitors, the Council has issued a little pamphlet, with a ground plan, giving a history and description of the property. The hill derives its name from the fact that it was one of the stations of the old semaphores, or signal posts, by which, long before the invention of the electric telegraph, Government messages were, in clear weather, transmitted to various parts of the kingdom with considerable rapidity. Telegraph Hill formed part of the succession of such semaphores, established just one hundred years ago, which placed the Admiralty at Whitehall in communication with Deal and Dover. The site, as will be inferred, is a somewhat lofty one. The upper and smaller garden on the summit of the hill stands at 160 feet above the level of the sea. Up to only a few years ago, Telegraph Hill stood in the midst of fields. London, however, has gradually crept up to and surrounded it; but it still commands fine views, especially to the southward. The conspicuous clump of trees near Sevenoaks, known as "Knockholt Beeches," can be seen from its summit.

THE New York Niagara Power Company is starting on the enterprise of a "model city" in the neighbourhood of the Falls. It is to be the most perfect city in existence, lighted and heated entirely by electricity, and therefore wholly free from smoke and fog; 30,000 families are to have homes of their own; five square miles, with 60,000 horsepower, are to be given to the manufacturers, and there is to be no liquor saloon in the place.

THERE is a Fifeshire legend to the effect that when Donibristle House has been thrice burned the Earldom of Moray will become extinct. The house was in 1858 destroyed by fire for the third time, and since then it has remained in ruins. Roofless and mouldering the weather-beaten ruins overlook the waters of the Forth and the Island of Inchcolm. The chapel, in which the late Earl was interred, and in which now lie the remains of seventeen members of the Moray family, is a quaint, unostentatious little building, situated about four hundred yards from Donibristle House, and is reached by a narrow pathway winding between ancient trees about whose gnarled trunks the ivy clings.

DR. LONGSTAFF is again Chairman of the Building Act Committee of the London County Council, and, in addition to the

appointments already announced, committee chairmanships have fallen to Mr. Bruce (Public Health and Housing), Mr. Thornton (Stores), Mr. Charles Harrison (Local Government and Taxation), Colonel Rotton (Industrial and Reformatory Schools), Mr. Fletcher (Parks and Open Spaces), and Dr. Collins (Public Control).

MR. B. PRIESTLY SHIRES, A.R.I.B.A., of Plymouth, following up his description of English architecture, took Adel Church, Yorks, as illustrating a typical Norman church, built A.D. 1130. Shortly before, the neighbouring Abbey of Kirkstall was commenced, and had stood from that time to the present day with very little alteration. Mr. Shires illustrated upon the black-board its many features from his actual survey of the church published several years ago. The plan was a very simple one, consisting only of nave and chancel, with a small modern vestry on the north side of the chancel and a beautiful Norman porch on the south side. Dividing the nave from the chancel was a highly enriched chancel arch with a great amount of carving in basso relievo. The ancient Norman roof over the chancel was one of the very few specimens of an early manner of roofing. For an Early English example, Mr. Shires commenced with Skelton Church, a purely typical church

of the period, the detail exceptionally rich, and the whole of the work of a very high order.

MISS JANE E. HARRISON, the well-known writer and lecturer on Greek art, who has received from the University of Aberdeen the honorary degree of LL.D., is the first woman to be honoured in this way. All the other women LL.D.s obtained the distinction after examination. Miss Harrison is also, it is probable, the woman to whom the honour is most appropriate. Her knowledge of Greek art is unrivalled.

A SINGULAR error which has appeared for a long period in all the best-known descriptions of London has been recently discovered. Mr. Fincham, the architect who has supervised the restoration of the crypt of the ancient Church of St. John, Clerkenwell, and Mr. Welch, the Guildhall Librarian, have found that the sketch of St. John's Priory, Colchester, has done duty for many a year in the guide-books for St. John's Priory, Clerkenwell. The St. Paul's Ecclesiological Society, having paid the crypt a visit, commenced searching for old prints of the Clerkenwell district at Guildhall, and in this way the old-time error was discovered.

LEEDS is going in thoroughly for the abolition of its insanitary areas. We are glad to learn that the Sanitary Committee has been authorised by the City Council to prepare a large scheme for dealing, under the Housing of the Working Classes Act,

with the property situated between North Street and the Parish Church. Alderman Ward, Chairman of the Committee, said at a recent Council meeting, that the area was about 77 acres, and the cost would be something between £300,000 and £400,000, but the land could be disposed of afterwards. From this, the scheme would seem to be provident as well as necessary.

THERE will shortly be sold, under the hammer, the large Devon property of Flete, an estate covering 5,600 acres, and having a rent roll of £9,000 per annum. The mansion itself is by R. Norman Shaw, R.A., the interior treatment of the house being very fine, notably the billiard room, hall, library and music room, the latter having a lofty barrel-vaulted, ribbed roof, with a fine organ at one end.

"TARA'S HALLS" are to be disturbed, a proposal having been made to explore the Hill of Tara. To many persons the name of Tara is best known in connection with Thomas Moore's spirited and tuneful verses. Antiquaries may be expected to know a little more about it, but even in their case much is the result of conjecture. Tara is only a little over twenty miles from Dublin. It is one of two hills which relieve the monotony of the level plain from which they rise. Curiously enough the Hill of Tara has never been properly examined, in spite of its great historical importance. The present proposal for its excavation is that the works shall be directed by experts under the supervision of the British Archaeological Association. Tara is covered with remains of a very early date, but it is on the southern side that the principal of these exist. A fence of stone runs across from the old churchyard and divides the Russell and Preston properties. On the southern side of this wall are the principal earthworks—namely, the Rath-na-Riogh or Cathair Corofin. The Rath-na-Riogh is a large outer earthwork encircling two raths or ancient Irish forts, the lines of which intersect. The western rath is the older of the two, and the centre of it is a raised mound, on which rests the Lia Eail still in Tara, which now covers the "Croppies' Grave." This has been removed from the crowning mould to the north-west, where it originally stood. This central mound, on which is the "Croppies' Grave," is about twelve feet above the surrounding fosse, and this is it that many persons are disposed to assign as the most probable site for Tea Tephi's tomb. Mr. George Payne, F.S.A., is to be invited to superintend the work of excavation.

WHEN Greek meets Greek! Mr. J. L. Macadam, the Scotchman who invented the road which bears his name, is said to have been a guest at a large dinner given in honour to Sir Walter Scott. Being asked to respond to a toast, Mr. Macadam rose, and, at the end of his speech, proposed the health of "the great Sir Walter Scott, the Colossus of literature!" In a instant Sir Walter was on his feet, and lifting his glass, exclaimed: "Here's to the great Mr. Macadam, the Colossus of roads!"

THE United Kingdom section of the Imperial Institute is to be augmented during the approaching summer season by an exhibition of railway appliances and inventions. The International Railway Congress, which is to be opened by the Prince of Wales in June, has supplied an appropriate opportunity for displaying the capabilities of

important branches of British industry connected with the railway services of the country, and the Executive Council of the Institute have undertaken the necessary arrangements. The exhibition will be located in special buildings in the south-east quadrangle of the Institute, and several of the leading manufacturers of the United Kingdom will be represented. Many of the exhibits will be shown in motion.

AMONG the many interesting Roman "finds" of recent years were the Roman tools discovered at Silchester. They exhibit great similarity to the implements of the present day, reminding one once again that there is nothing new under the sun. The iron plane in particular bears great resemblance to the American ones now in use, while the anvils and other tools are equally like those now used. When they were on view a facetious spectator suggested that they had been made at Sheffield and buried (for the purpose of discovery) on the site of the old Roman city.

MAXIM, the gun man, first established works in Hatton Garden, Holborn, England, early in 1884. By his indomitable application and persistent study he perfected his idea, so that during a machine-gun competition at Hythe he beat all competitors, his gun having a total weight of but forty pounds, firing 1,000 rounds in one and a quarter minutes. After this he exhibited his destructive weapon in various parts of Europe. The Maxim gun was thereafter speedily recognised to be the most deadly instrument of warfare in existence. The guns were first fired in actual warfare by Sir Francis de Winton during the Sierra Leone campaign, and were also employed by the great African explorer, H. M. Stanley, in his last famous travels.

"MEN WHO BUILD: MR. JAMES BROOKS."—By an easily explained error we attributed "The Entrance to Humewood, Co. Wicklow," an illustration of which appeared in our last number, to Mr. James Brooks. The original architect of Humewood was Mr. William White, and Mr. Brooks was called in to complete the work. This, he did. The Entrance, however, Mr. Brooks desires us to state, was entirely by Mr. William White, F.S.A.

The Builders' Journal.

MEN WHO BUILD.

No. 9.

MR. T. J. BAILEY,

ARCHITECT TO THE LONDON SCHOOL BOARD.

AND Mr. Bodley imagined that his delicate little building on the Thames Embankment would form the key note of a huge pile contributed by no less than four architects, he would not have treated his elevation as he did. London does not possess a finer position for the administrative head-quarters of its School Board than where it stands, tucked away in close proximity to the delightful "blocks" in Arundel and Norfolk Streets, most of which are from the boards of Mr. John Dunn; close also to the secluded nooks and crannies of the Middle Temple, with its tiny fountain in Fountain Court still agitating the little gold fish "versed in the law;" and overlooking Fowler's statue in the little garden with the band stand, beyond which the lazy ripples of the dear old Thames laves the mud on the further shore, gently putting the barges to bed upon its bosom, or waking and taking them away before morning breaks. Wharves of hideous outline form the horizon; to the right, "if it wasn't for the bridges in between," one could get a glimpse of Big Ben and the fine contour of London's one neglected boulevard; and to the left, where once stood an honest printing house of fame and reputation, Waldorf Astor, the American, has come along, with John Pearson, R.A., and builded himself a mansion, faire to see, of stone and much carving, with his coat of arms above the entrance way, and much marble and alabaster and fine woods within. And lo! upon the weather vane appeareth a big ship, methink in copper covereth with gold; and the ship is a galleon of an old century, typical of the going of Columbus. And Waldorf Astor loves Columbus for he has reason so to do.

You are not impressed with the architecture of the London School Board headquarters, without or within. It is the home of education, not of art, and many of the Progressive division find pleasure in the thought that whilst they insist upon wide corridors and ample lighting in their schools, the magnanimity of their hearts allows them to discard both in their home on the Embankment. A dilapidated model of a Chinese or Japanese schoolhouse forms the feature of the hall, a silent reference to the warfare which goes on in the placid Council Chamber at the Temple end of the building. There

are sporting proclivities in the School Board, for the lift boy—of Progressive faculties also—begs you to tell him if the paper which you carry contains the latest cricket. It does, and the lift boy is happy.

Mr. Bailey's office is on the second floor, with a truly magnificent view over the river

LAVENDER HILL SCHOOLS: MR. T. J. BAILEY, ARCHITECT.

You tell him so, but he smiles and says he has no time to look at it. He lays up all his appreciation for natural scenery until the time he takes his yearly holiday, and for nearly 30 years he has trotted through Europe with his sketch book and measuring rods, sketching and measuring as he goes along. "The finest way, I tell you, of blowing out the dust of duty, and laying up a stock of vigour and energy against your next ramble," Thomas Bailey does not dangle with the fringe of art. Many years ago as a boy he entered the office of Mr. Withers, the Church Architect of Doughty Street, served his articles with him, travelled with him, sketched with him, left him to go to Ewan Christian for a couple of years, and then went back to Doughty Street, because his old master was miserable without him. Mr. Withers died, and Thomas Bailey, five and twenty years ago, came as an assistant to the

were only 21 or 22 feet wide, the desks occupying 12 to 13 feet from the back, and the space in front used as a passage, and full up with teachers' desks, blackboards, and general teaching paraphernalia. The staircases were narrow and ill-lighted, and fed the schoolroom with cold air in the winter which counteracted any warming power supplied in the room. The arrangement of cloak rooms and lavatories was extremely haphazard, but the requirements of the Education Department were very different from what they are at the present time, for even so recently as twelve years ago it published model plans for schools of varying sizes, which, if followed now and sent to it, would receive distinct condemnation. Mr. Bailey is good enough to go through these details with you and to point to the pitch of advancement the planning of schools has now reached. The want of access to class-

side-lighted, and having its separate access directly into the hall or corridor. The Education Department now require that there shall be a minimum of 30 square feet of open play ground for each child; the larger the school, the greater density of the population around it, and, consequently, the greater need for these open spaces. The comparison between the earlier and present schools would not be complete without a reference to the offices and latrines. The old system has long since been found to be insanitary, and the stoneware glaze trough and automatic flushing tank has altered matters greatly, although, even yet, perfection has not been attained in this direction. Experiments are still being made in order to get rid of the trough system altogether.

Of the architectural features of the schools themselves, Mr. Bailey has much to tell. Like the honest man that he is, he lays all

THE PLOUGH ROAD SCHOOLS, LAMBETH: MR. T. J. BAILEY, ARCHITECT.

London School Board, before it had attempted to build a single School under its own direction. In those early days the work was put out to competition, but as it increased it became necessary to centralise the administration, and now the drawing office houses twenty draughtsmen, and Mr. Bailey has the actual superintendence at this moment of work costing half a million of money. It is amazing to follow the advance of school planning since the Board first began work, and to listen to Mr. Bailey tracing its development. Twenty years ago the buildings were planned with a long central room, and one or two small class-rooms at each end. The central room, a schoolroom, crowded with children, was a passage to reach the class-rooms, and was arranged with desks along the back wall, the principal window being in this wall, behind the children, and full in the eyes of the teachers. These rooms

rooms developed the corridor, but, at first, these were built narrow, were used as cloak rooms and not warmed. These corridors, now in their turn condemned, were widened from 4 feet to 8 feet, then to 12 feet, then to 20 feet, and then by a process of evolution the hall became developed. As soon as the corridors were widened, separate cloak rooms were built. A system of warming, other than by open fires, was established and extended to the corridors and cloak rooms, and thus the discomfort of draughts from the staircases was obviated. As soon as the hall became recognised as a necessary part of the school, when the class room system was entirely adopted, the need for dividing up the main room to isolate the classes no longer existed, as the big teaching room ceased to exist, and the schools then consisted of the requisite number of independent class-rooms, each properly

the praise at the feet of Mr. Robson, whom he assisted for a very long time and whom he succeeded eleven years ago, when Mr. Robson resigned his position, to accept the position of consulting architect to the Board of Education. It may be quite true that Thomas Bailey has merely continued the lines laid down by Mr. Robson, but as he worked side by side with his old chief and has, since Mr. Robson's retirement, pressed his own "striking" individuality upon the work, it would not be fair to take from him much that is his due. During the eleven years Mr. Bailey has been at the head of affairs he has carried out work to the value of two millions and a half and every building has been planned by his own hands. At the moment he is constructing elementary schools, schools for children of feeble intellect, centres for the deaf, for cookery, for laundry work, and for manual training. There

are also in course of construction offices for divisional business and a large institution on the cottage system for the deaf at Anerley. The officials of the School Board, Mr. Bailey tells you, do not recognise dumbness; they teach the dumb to speak, and he says that the system is having some remarkable results. The children of weak intellect are most tenderly considered. Little schools of three or four class rooms are constructed in central positions, and the poor little children drawn from the general schools, and subjected to every care and consideration. In the area over which Mr. Bailey holds sway there are at the present time no less than 500 buildings, and so close is the chief architect's connection with his work that he has been actually connected with every single one; can centre—owing to a remarkable memory—the planning and details of each, and can at any moment answer any question appertaining to the construction of any one. At one time it was decided to put the planning of a certain school out to competition, and Mr. Macvicar Anderson was appointed assessor. When the award was made it was discovered that the successful competitor was an old assistant of Mr. Bailey's, and that the plan was identical in every single feature, almost in every single line, with an existing school built by him. That fact settled once and for all the question of competitions.

Perhaps the finest schools the Board has ever erected are the Hugh Myddelton Schools, which you are happy to be able to illustrate. This school stands upon an historic site, taking the place of a portion of the old House of Detention in Clerkenwell, and which was opened by the Prince of Wales. The area of the site is 95,832 square feet or upwards of two acres, and being surrounded by streets is well off for light and air. The school is built for 2,000 children in three departments.

There are also on a site a separate school of 12 classrooms, six on each side of a corridor 20 feet wide, for the instruction of the deaf, also a centre for cooking instruction, and a centre for laundry work. The main school, three stories in height, has a centre hall on each floor, 80 feet by 40 feet, classrooms being on either side. Eight superficial feet to each child is the "item" of calculating the accommodation. Needless to say, the questions of warming and ventilating were soundly considered, and already the Board has recognised the perfection of the school by determining that higher standards should be taught there, and that a chemical laboratory be at once erected.

In his domestic moments, Thomas Bailey lives at Norwood, but he has a little "hut" near Fleet Pond, in Hampshire, that he visits when the evenings are long, and the smell of the pines have more power than the beautiful view from his rooms on the Embankment. He has more legitimate architectural work passing through his hands than perhaps any other man in London,

and he rivals his old chief and colleague, Mr. Robson, in being an authority on school planning in England. He has a heart beyond Board Schools, however, and in his leisure moments can dilate upon the work of Norman Shaw and John Pearson, that can come only from a man with the faculty of good work, and an appreciation of the highest and most beautiful.

SUGGESTED ECONOMIES IN THE MANUFACTURE OF IRON.

MR. ERNEST W. HARVEY, F.C.S., Associate of the Royal School of Mines, gave an address at Dudley, before the South Staffordshire Institute of Iron and Steel Works' Managers, relative to some suggested economies and improvements in the manufacture of bar, hoop, and sheet iron, having special reference to the fuel used and to the furnaces employed. He was of an opinion that for at least many

ever, that manufacturers should study in detail where economies—however small they might be in some instances—might be effected, so as to enable them to cope with increased competition. The most striking losses, from a fuel point of view, in the ordinary direct fire furnaces, so largely in use in ironworks of this country, were—(1) loss of fuel by maintaining the walls of the fireplace, in which no effective work was done, practically at the same temperature as the heating-chamber; (2) loss of fuel by maintaining the walls of the neck or flue, in which no work was done, practically at the same temperature as the heating-chamber, and by radiation and convection of heat from the surface of its thin walls; (3) loss of heat in the waste gases or chimney flue, due to inefficient boilers attached to such furnaces; and (4) loss of fuel by imperfect combustion of the coal-gases. He had had experience in the practical working of the new form Siemens furnace (introduced

by Mr. Frederick Siemens, of Westminster), both in the industrial districts of this country and in many of those on the Continent. That experience had convinced him that it was quite possible to obviate, or partially obviate, the defects or losses in the old furnaces, and to realise a considerable saving in fuel as well as in the puddling of iron in its subsequent reheating to welding in the mills, in heating iron in the form of scrap for making so-called scrap-bars, and in annealing iron and steel. The chief advantages of the new form Siemens furnace over the old ones were—(1) the sensible heat of the gaseous fuel issuing from the separate gas producers, and the heat formerly radiated from the incandescent fuel therein, was better utilised by making the gas-producer form part of the furnace structure itself; (2) the heat-giving power of the tar and soot formerly deposited in the cooling tubes or long

flues was now applied directly in the heating chamber; (3) the loss of gas at each reversal of the flame currents was avoided, also loss by escape of gas direct to the chimney through imperfectly fitting valves; (4) the saving in fuel by returning a portion of the hot products of combustion to the fuel in the gas producer, whereby the C O₂ contained in them was converted into C O. It was only reasonable to suppose that any apparatus which possessed the means of regulating the loss in metal or fuel would ultimately prevail, and displace one having no such means of regulation, or of which the good or bad results were due to chance. English ironmasters could effect real economies if they would improve and modernise their plant or apparatus, as had already been done by so many ironmasters in competing countries.

The ashes of coal from certain mines in South Africa have been analysed recently, and found to contain over nine pennyweights of gold to the ton.

HUGH MYDDELTON SCHOOLS, CLERKENWELL: MR. T. J. BAILEY, ARCHITECT.

years to come iron, although described as old-fashioned, would be in request for certain specific purposes, amongst others in cases where welds had to be made, such as bar-iron for smiths, chains, forgings, steam-hammer piston-rods (where percussion was constantly taking place), and soft iron for dynamos and other apparatus used in the electrical industry. On the other hand, it was certain that steel had displaced iron definitely and permanently for many purposes; although new uses had been found for iron of recent years, it was probable that the quantity required for such new uses was less than that already displaced by steel. The result was that the ironworks of this country, Belgium, France, and Germany were not so busily employed as formerly, and, consequently, competition among masters to secure orders for iron had proportionately increased both here and abroad, bringing the price of their produce so low as to leave only a very small margin of profit, and, it was feared, in many cases no profit at all. It was, therefore, now more necessary than

ARTISANS AT WORK.

COMPETITIVE HANDICRAFTS AT THE
BUILDING EXHIBITION.

A SERIES of interesting competitions in various handicrafts was a feature at the Building Trades' Exhibition which closed on Thursday night. The competitions took place the prior Saturday, and medals in silver and bronze were offered as inducements to highest effort, and the active movements of competitors working beside each other on similar tasks produced among spectators a mild form of the excitement that is aroused by a sporting contest. Moreover, there was interest in seeing how rapidly rough materials could be wrought into familiar shapes by the hands of cunning craftsmen. For carpenters, joiners, plumbers, and bricklayers, the tasks set did not permit any play of fancy. One group was engaged on the framing of roof timbers, in

work would cease. More leisurely, but still marked by surprising dexterity and directness of method, was the work of modellers, who from their own designs decorated spaces of given form with arabesques of figure subjects wrought in clay. The prevailing thought was over elaboration of detail, but two or three competitors adopted an artistic breadth of treatment, and modelled the flowing curves of leaves and flowers, the bold lines of grotesque heads, or the delicate features of a woman's face with skill and evident knowledge of the effects to be produced by simple means. There was art also in the work of stonemasons, who, following each his own design, cut arch stones from the rough blocks, reduced these to a variety of forms by mouldings that necessitated much dexterity, and relieved the contours by carving conventional ornaments on them. Plasterers moulded elaborate friezes; tile fixers laid sections of tessellated pavements from drawings which

and S. Evans, certificate. Masonry—Francis Montague, bronze medal; and John Hawley, certificate. Modelling in Clay—C. Giddings, silver medal; A. H. Borrowdale, bronze medal; and Robert Bussey and P. J. W. White, certificates. Painting and Decoration—S. Moore, bronze medal. Plastering—Alfred Brown, bronze medal; and W. T. Drew, certificate. Plumbing—G. Crabbe, silver medal; C. W. Walter, bronze medal; and W. J. G. Fraquair and W. Webb, certificates. Tile Fixing—Henry Lambert, bronze medal.

OUR Paris correspondent writes: The château of the Marquis de Solages at Carmaux was burned down last week. It was insured for £40,000, but quantities of rare pictures, furniture, and of old and interesting family papers have been destroyed. The Marquis is one of the directors of the Carmaux Collieries, of which he and his father-in-law, Baron Reille, are the principal proprietors.

SOUTH ELEVATION OF HUGH MYDDELTON SCHOOLS: MR. T. J. BAILEY, ARCHITECT.

accordance with dimensions given. Another had to prepare portions of window-sashes and frame together the joints of a four-panelled door. The bricklayers had to build twelve courses of a wall with angles, and window reveals true to plan, and the plumbers were all busy on junction pipes and the soldering of taps. Each competitor had, however, to set out on paper the methods which seemed best to him for executing his work in hand, so that mere skill did not count in the absence of any knowledge of constructive principles. Thus, the competitions had an educational value as means whereby every man could gauge the progress he had made by study at home or in a technical school. For each group of competitive work, the time allowed was eight hours, but one carpenter at least had finished his framing of king-post and tie-beam so quickly that he was able to enter the joinery competition, with a fair chance of getting through that also before ten at night, when

they had prepared previously; painters decorated panels by graining or fanciful designs, and smiths had an opportunity of showing how iron may be wrought into beautiful forms by the use of hammer and chisel. The judges were Messrs. A. Baker, H. Dawson, G. Pearson, H. D. Searles Wood, J. F. Clarke, G. A. P. Cuxson, B. J. Dicksee, W. Gullin, W. C. Street, Max Clarke, H. Leonard, Douglas Matthews, B. Tabberer, L. Solomon, C. T. Aston, J. W. Valentine, T. Blashill, H. W. Burrows, F. R. Farrow, J. Herrin, J. S. Edmeston, W. Gwyther, Gordon Smith, S. Collins, T. Greenwood, Lewis Angel, F. Hooper, W. G. Drew, E. W. Nightingale, T. W. Cutler, S. Hillyer, W. H. Webb, and Professor C. Unwin. The Duke of Fife distributed the prizes on Thursday to the successful competitors as follows:—Bricklaying—T. H. Smith and John Burgoyne, bronze medals, and Frank Mills, a certificate. Carpentry—W. Wyatt, silver medal; A. S. Sewell, bronze medal;

IMPROVEMENTS are to be carried out at the Burton-on-Trent workhouse, at a total estimated cost of about £2,000.

ON Tuesday afternoon last Mr. Thomas Codrington, Local Government Board Inspector, held an Inquiry at the Upton Asylum, Chester, into an application of the Cheshire County Council for the sanction of the Local Government Board to borrow £80,000 for the purpose of enlarging the asylum.

THE erection at Yeovil of the Cole Memorial Church, in Sherborne Road, is to be proceeded with. It is estimated that the cost will be about £8,000.

IT has been decided to form a limited company for the erection of a physical training college at Sheffield. The total cost is estimated at about £14,000, and it is proposed to raise £8,000 of this on mortgage and commence with £6,000 capital in £1 shares. There will be six shops underneath the college, which is to be built in a central part of the city, and is intended to be in position and equipment only second to that of Liverpool.

A POET ON PETERBOROUGH CATHEDRAL.

MR. WILLIAM MORRIS ANXIOUS.

MR. WILLIAM MORRIS, poet, printer—a mediæval man spirit in modern life—writes with reference to the Dean of Peterborough's account of the damage done to the West Front of Peterborough Cathedral:—"Everyone who has any interest in art or history," says he, "must be much moved by this accident and wish for its speedy repair. I may add, also, that for some years past it has been known that this magnificent work of art, which is by common consent the noblest and most beautiful of our English West Fronts, has shown

which it may be dealt with by its responsible guardians—the first would be the successful, the second the unsuccessful way. If treated successfully it will come out of this trial with its beauty intact, its external appearance unchanged from what we have known and admired in our lifetime. Unsuccessfully treated it will bear the appearance of a modern piece of work founded on an ancient design; and in that case it will have lost the greater part of its interest in the eyes of the historical student and the wide-minded artist; in short, it will have been 'restored,' and its genuine existence will have come to an end. That this is no chimerical danger is obvious from the fact admitted by almost all observers that all our great architectural monuments have suffered

engineering and building skill before the critical part of the work is undertaken; though the preliminary work of supporting and shoring the threatened parts should be put in hand as soon as possible. And again I must say that if the front be taken down and rebuilt, instead of being made safe in its place—as I cannot see any reason to doubt it may be—the work will not be done, but undone, and a lasting shame will lie upon all who are responsible for the preservation of the fabric. It would be a great relief, therefore, to all genuine lovers of the master art of architecture if we could receive an assurance from the Dean—1st: That as little disturbance of the surface of the building shall take place as possible, and that consequently no merely decorative features shall be reproduced in imitation of the old work. 2nd. That every device which skill and knowledge can suggest shall be exhausted before rebuilding be even thought of, and that consequently a committee of consultation chosen from the best (not necessarily the best known) engineers and architects shall be called together to consult on the various devices for making the West Front good. I think that the public have a right to ask the Dean for the fullest possible information of what is intended to be done before they respond to his very reasonable and necessary appeal for funds. I cannot doubt that he will give that information readily and freely."

signs of movement, probably due to some defect of the foundations caused by the draining of the fenland; so that a thorough search into its present condition has been recognised to be necessary. I must say, for my own part, that an intimate acquaintance with the West Front of Peterborough has made it so much a part of my life, that I long to see it put out of all peril by judicious repair and essential strengthening of its structure, and I have no doubt that the Dean shares this feeling with me. I heartily wish I could leave the matter here with a promise of what pecuniary aid I could afford; but there is another danger to which this great monument of English art is exposed besides that of falling into ruin. There are two ways in

more or less from the restoration mania during the last fifty years, and that some (e.g., Worcester and Lichfield Cathedrals, to go no further) have been almost destroyed by it. I am well aware that the difficulties in the way of successful structural repair of Peterborough West Front are, from the nature of the case, very great, that they are serious enough to tax heavily the skill and experience of the best masters of construction amongst us; but at the same time I am sure that they can be overcome by patience and the expenditure of a large sum of money. Only I think the occasion so important, that the burden of undertaking the work should not be thrown on one man's shoulders, and that a consensus should be held of the best

The Builders' Journal COMPETITIONS.

RULES.

- 1.—There must not be more than three separate sheets of drawings submitted by any competitor in any single competition.
- 2.—The scale must be a uniform one of 8 feet to the inch for plans, elevations, and sections. Detail drawings must be to half-inch scale, and a perspective in ink may be included.
- 3.—All drawings must be inked in, and be without colour or wash.
- 4.—Drawings in each competition must be sent in on the date specified, and must be submitted under a motto, accompanied by the name and address of each competitor in a sealed envelope.
- 5.—All competitors must be under the age of twenty-six.
- 6.—A public exhibition of the premiated designs will be held. The result of each monthly award will be announced in our columns and the assessors' reports will be published in full. The drawings will remain the property of their authors, but we shall reserve the right to reproduce any we think fit.

THE AWARDS.

- 1.—A Gold Medal and a Cheque for £10 10s., to the competitor who submits the best half-dozen sets of drawings during the session of twelve months.
- 2.—A Silver Medal and a Cheque for £3 3s., to the competitor who submits the best single set of drawings during the session.
- 3.—Certificates signed by the Assessor and countersigned by THE BUILDERS' JOURNAL, will be awarded to the authors of the premiated designs in each competition, who will each receive a cheque for half-a-guinea for out of pocket expenses.
- 4.—At the end of the session the whole of the premiated designs will be submitted to a committee composed of the monthly assessors, and the Gold and Silver Medals and cheques will be awarded by them.

MR. F. A. S. CRAWSHAW has been appointed surveyor to the Wortley District Council at a salary of £250 a year.

Awards of the Assessor.

No. 1.—A SEA-SIDE BUNGALOW.

The drawings submitted in this Competition were considered by Mr. Aston Webb, F.R.I.B.A., who has placed the sets in the following order:—

FIRST. "Cedric."

Mr. ARTHUR STRATTON,
University College, Liverpool.

SECOND. "Marvel."

Mr. SIDNEY HALL GOODWIN,
42, Albert Road, Croydon.

THIRD. "Dobenda."

Mr. DAVID B. DOBSON,
707, New City Road, Glasgow.

Certificates will be forwarded to the authors of these drawings as soon as possible, with cheques for half-a guinea.

THE SECOND COMPETITION.

A Village Club House.

The Proprietors of the BUILDERS' JOURNAL invite drawings, in competition, from those under twenty-six years of age, for a Village Club House, on a corner site, 150 feet by 40 feet. The Club to contain a general room with a dais for the villagers, a reading room and library, a bowling alley, service bar, tea room, committee room, housekeeper's apartments, and three cubicles for public use. The necessary outbuildings must be provided. Cost not to exceed £2,000. Drawings to be delivered at Talbot House, Arundel Street, Strand, not later than Monday, the 6th May, 1895.

COMMENTS UPON COMPETITORS' DESIGNS.

The examination of the drawings submitted in this competition has not been a very difficult task, for the details of the planning of a Bungalow appear to have been too much for the average student, and yet nothing could be simpler. The author of "Marvel" is the only one who has grasped the requirements of a "common hall," and his ground plan, so far as the relative position of his rooms is concerned, is good. "Cedric," however, has been more practical in his plan, and infinitely superior in his elevations. His study is cleverly placed and arranged, except for its fireplace, and it should have had access to the common hall. We are not quite pleased with a single bedroom, and that the principal one, on the ground floor, a day's journey from the bath room; but otherwise the plan has many good qualities, and we are glad to see that Mr. Stratton is working in methods that will bring him credit. We like his long, restful roof. The continuous demarcations between his stone walling and the slate-hung upper storey is also good, and his loggia is delightfully arranged. With his lodge and stabling we cannot find a single fault, but he must commence at once to devote more

care to the finish of his drawings. It has been a difficult task for us to reproduce the elevation of the sea front and the ground plan.

"Marvel" has laboured long upon his set, and his neatness is to be commended, but in practical drawings he will find his lines must be stronger. His ground plan, which, with elevations, we will publish next week, pleases us in its general scheme, but there are some serious blunders. The entrance from the vestibule to the hall should have been opposite the study door, the foot of stairs being set further back for the purpose. The cupboard in his oriel should give place to a "smoking" seat, and the "verandah" on the sea front is puny in the extreme. Mr. Goodwin has "gone to pieces" on the first floor. His landing or corridor should have been trussed out over the

would have taken him well to the front. A loggia of three feet wide and forty feet in length is, however, an anomaly. We shall give a couple of illustrations from this set.

"Herbert" has a good idea of a bungalow, although there are many serious faults in his plan. He walks straight from his porch into his "hall or dining-room," and he breaks his external walls up into all manner of bays and corners. The author has a good grip of design and only needs to cultivate it.

"Jupiter" gives us an extremely good hall and study, boudoir and best bedroom on plan, and his staircase is better arranged than any other, but his elevations are lacking.

"Pendragon" puts the whole of his accommodation on one floor, and we think he is justified. His plan has some extremely good quali-

hall. He would, by that means, have improved his ground floor, and have added vastly to the planning of his bedrooms; they are all too small. The elevations of "Marvel's" designs are far too severe, and like most of the competitors he is better with his lodge and stabling than with his house.

"Dobenda's" work, which we shall also illustrate next week, is like the two previous sets—a double storied design—although he finds it necessary to put three bedrooms on the ground floor. The plan is that of a suburban villa, and if a bit too irregular and unrestful, is not bad at that. There is a happy spirit in his elevation which, without the hexagonal bay and the semi-circular dormers, would build up far better than they appear on the drawings.

The drawings submitted by "Violet" give us pleasure. They are, in execution, the best sent in, and his perspective sketch discloses powers of good draughtsmanship. His elevations also are extremely good, but his interior planning destroys the possibility of a place. His common hall is, however, good, and its arrangement on the first floor would look remarkably well in execution. Had the author arranged his entrance in the middle of his long front instead of in the corner of a short one, he would have disposed his ground plan in a way which

ties, but here again his porch opens direct into his hall or dining room, with no possible chance of hiding the dining table from a persistent rate collector, and the kitchen block is "brought out" from the principal line of frontage. With these failings amended, and the elevations more tastefully treated, "Pendragon" would have scored.

We can spare no further space to comment on the work of the other competitors. Ambition to do big things has o'erleapt itself in many instances, and several young men are evidently playing some practical jokes with architecture; but perseverance is the great thing, and our young friends will find that our criticism of their work is offered in just the spirit that will emulate them to do better hereafter. They should interest as many of their fellows as they can in these competitions. Men between between twenty-one and twenty-six should be capable of sending us some excellent work.

THE Hampstead Vestry have decided to spend £5,260 in extending their system of electric lighting, and also to ask the Willesden District Council if it is willing to pay half the expense, estimated at £1,460, for laying the necessary mains, &c., in the High Road, Kilburn, which divides the two districts.

THE plans for the new Congregational Church, to be erected in Poulton Street, Kirkham, Lancashire, have been prepared. The edifice will be of handsome design with a tower, under which the schools will be arranged. There was also recently completed the first portion of a new church at Wesham, consisting of nave and aisles (the full scheme including chancel, vestries and transept, with tower and spirelet at west end), Messrs. Paley, Austin & Paley, of Lancaster, were the architects.

"Cedric."

ARCHITECTURAL IRONWORK:
CONSTRUCTIVE AND DECORATIVE.

A Series of Instructive Papers for the
Artist and Worker.

CHAPTER VI.
BEAMS AND GIRDERS.
(Continued.)

REVERTING to the remarks upon the proper section for the cast-iron architectural members, we would point out that the ultimate form arrived at by Hodgkinson, as being the best and most stable, is that combination of a vertical central web, provided with a flange at the top and the bottom, of which we gave a somewhat rough diagram at Figure 10. In Figure 11, however, given in this present chapter, we give a more exact and detailed sketch, which is necessary for a due appreciation of the tables presently to be adduced. The chief principle of the girder, of which Figure 11 is a transverse section, is that the lower flange must contain six times the area of the upper one. The several proportionate dimensions—which have not been rigidly followed in the illustration, which is only a rough drawing—are taken as follows: 1. For the depth, the total dimension D. 2. For the breadth of the bottom flange, the width B, and for the two thicknesses, one is taken at the centre BB, the other B at the end of the flange. 3. For the top of the flange, the width T; and for the two thicknesses, one is taken at the centre TT, and the other T at the end. In this manner the dimensions of the flanges are quite independent of the thickness of the rib. 4. For the rib, the two dimensions RR and R are measured as continued to the extreme top and bottom surfaces of the girder, with a similar view of making these dimensions independent of those of the flanges, and promoting exactness in defining the whole section. The proportions of the rib are undetermined, but it is evident that they should bear some ratio to those of the flanges. The rib must be sufficiently rigid to prevent lateral weakness. Moreover, the very theory which maintains

the principle of the "neutral axis" (referred to in the preceding chapter), also recognises the increase of the forces of compression and extension upwards and downwards from the neutral axis, and this would, therefore,

Figure 11.

lead to the adoption of a rib tapered in both directions. In practice it is found best so to taper the rib that it meets each of the flanges with a thickness corresponding to that of the flange itself, for if any great dispro-

portion exists it may lead to bad consequences in the founding, as the operation of casting the beam or girder cannot be so perfectly performed, from unequal shrinkage of the metal, and an imperfect casting, or one having flaws in it, renders futile all calculations of strength. Hodgkinson gradually varied the form of the section of girder in his experiments until the widths and depths of the flanges were as follows: Top flange, 2'33 in. wide, 0'31 in. deep; bottom flange, 6'67 in. wide, 0'66 in. deep; the areas being '720 in. and '44 in. The rib was '266 in. thick, and the total depth 5½ in. The constant, or C, was found to be 514 for cwts. and 26 for tons.

Most of the authorities on this important matter adduce very complicated algebraical formulæ. Instead of following their lead in this respect, we prefer to give the following reliable table, which gives the particulars of section of cast-iron main girders, calculated to support 1½ cwt. per foot superficial. For the letters at the top of the columns the reader will refer to Figure 11:—

The casting of girders and beams (and, indeed, of all other structural cast-iron work) the caution which we gave with regard to the stanchions, should always be borne in mind—that is to say, the internal angles must not be sharp. If they are, mischief will, in all probability, result in consequence of the arrangement of the atoms of the iron in reference to the planes of crystallisation, as explained by Mr. Wallet, and by us given *in extenso* in Chapter III. This may easily be provided against by fixing a splice or fillet in the angle of the pattern. In our succeeding chapter we shall deal with cast-iron and girders.

(To be continued.)

MR. R. WALTON, Local Government Board Inspector, recently held an inquiry at the Southport Town Hall, respecting applications by the Council for borrowing powers for further improvements on the foreshore and to extend the electric lighting in the borough. The Corporation are constructing a marine carriage drive, connecting the two lakes, and throwing over them a bridge, which is a continuation of the drive. For the completion of this work, £8,500 additional is asked for, bringing up the total to £29,250. For the electric light, £15,500 additional was asked for for street lighting and extended house connection. This would bring up the total sum borrowed for the purpose to £43,500.

A SITE for the New Liberal Club, at Accrington, has been secured, and the building is expected to cost £2,500. It is hoped to raise at least £1,000 towards this sum by the bazaar recently opened by the Mayor.

A NEW Wesleyan Chapel was opened on Thursday afternoon at Arthington. The building is of Early English Gothic design, from plans prepared by Mr. W. H. Beevers, architect, Leeds. It is constructed of Shipley stone, with Ashlar stone dressing lined with brick, and adjoining it is a schoolroom, together with vestry and caretakers' rooms. The total estimated cost is about £1,400. The principal contractors have been Messrs. Rhodes Brothers, of Shipley.

MRS. J. B. CLARKE, Local Government Board Inspector, held an inquiry at the Middlewich Town Hall, on Wednesday, respecting an application by the Middlewich District Council for permission to borrow £12,000 for a new water scheme.

In the competition instituted by the Belfast and County Down Railway Company for a sea-side hotel to be built at Newcastle at a cost of £25,000, the assessor, Mr. Alfred Waterhouse, R.A., has placed the premiated designs in the following order of merit:—(1) £100, Mr. J. J. Farrell, 6, Westmoreland Street, Dublin; (2) £75, Messrs. Gibson and Russell, 11, Gray's Inn Square, W.C.; and (3) £50, Mr. F. H. Tulloch, 39, Victoria Street, London, S.W., and Lionel Littlewood, 49, Doughty Street, Bedford Row, W.C., joint architects.

Trade and Commerce.

We shall be glad to receive copies of catalogues from firms engaged in the allied building trades. These will be carefully looked through, any novelty noted, and—should its nature seem to demand it—fuller attention drawn thereto. We are particularly wishful to secure the friendly interest of designers and artificers in *THE BUILDERS' JOURNAL*, and, now and then, we might see our way to reproduce an outline sketch or illustration of any contrivance that struck us as being new or needed. Building covers up—figuratively, and in fact—so much ground, and we mean to cover the whole of it.

We should be further obliged if firms would indicate, by some suitable mark, the pages in their catalogues to which they would, in particular, desire to call our attention.

Property Sales.—Little fault could be found with the competition at the Auction Mart, Tokenhouse Yard, last week. For the usual small brick-and-mortar investments there was a capital demand, freeholds in Hackney changing hands at from eighteen to twenty-five years' purchase of the existing rentals. A few good City lots were on offer, but, although bidding was fairly active, very little business was done. The public market for West-end residences is still unsatisfactory, but important transactions continue to be effected daily by private contract. It was an unusually heavy week for stocks, shares, and reversionary interests. Although the auction season for large landed properties will not begin till late in the present month, when the vast Somersetshire estate of Wrington will be brought to the hammer in Bristol, good business continues to be done by private treaty. Within the past few days Mr. Edwin Jones has acquired, for close on £20,000, the Herefield estate, near Southampton, comprising mansion, park, and 240 acres; Miss Penny, of Wellington, the Bearsden estate, near Exeter; and Mr. J. W. Newcombe, the Elms Park property of Sir A. de Capell-Brooke, Bart.

The Nautilus Grate.—We were very interested, at the Exhibition, in this Grate, made by James Petter, of Yeovil, and we have two in a country house, from which a couple of the old hob grates were long since removed. It is in many ways better than the ordinary dog grate which causes—owing to a deal of wood being burned in country houses—a deal of dust to accumulate. We cannot speak of the prices, but no doubt they are reasonable.

Wood Stains.—A solution of 50 parts of commercial alizarin in 1,000 parts of water, to which a solution of ammonia has been added drop by drop until a perceptible ammonia odour is developed, will, says a contemporary, give to fir and oak a yellow-brown colour, and to maple a red-brown. If the wood is then treated with a 1 per cent. aqueous barium chloride solution, the first named becomes brown, and the latter a dark brown. If calcium chloride be used instead of barium chloride, the fir becomes brown, the oak red-brown, and the maple a dark brown. If a 2 per cent. aqueous solution of magnesium sulphate be used, the fir and oak become dark brown, and the maple a dark violet-brown. Alum and aluminium sulphate produce on the fir a high-red, and on oak and maple a blood-red. Chrome alum colours maple and fir reddish brown, and oak Havana brown. Finally, manganese sulphate renders fir and maple a beautiful dark violet-brown, and oak a dark walnut-brown.

In re S. Elliott.—A first meeting was held on Friday under a receiving order recently made against Samuel Elliott, carrying on business as a joinery and moulding manufacturer, at Broad Street House, City, and Newbury. The business was stated to be an old-established and very valuable one, and hopes were entertained as to the formation of a company for the purpose of taking it over and working it for the

benefit of the creditors. The debtor attributed his failure to losses and expenses incurred in exploiting patents, and to heavy law costs. The accounts were not completed, but the liabilities are estimated at about £80,000. Mr. Reader stated that the debtor was not at present in a position to submit a scheme for the consideration of the creditors, and he consented to adjudication. The proceedings resulted in the appointment of Mr. Bayne, of Leadenhall Street, as trustee of the estate, with a committee of inspection.

Strike in the Leicester Building Trade.

—Meetings of both the master builders and the Leicester carpenters and joiners who have come out on strike were held on the 1st inst. At the meeting of the employers it was decided to engage skilled operatives, unionist or non-unionist, at 8½d. per hour—the advanced wage—on one condition, and that was that they should accept the rules which had existed since 1891, until a new code could be settled between the Masters' Association and the Operatives' Society. But as the operatives insisted on the adoption of their new rules *en bloc*, they remained out, and the deadlock continues.

The Fireproof Construction Company.

—This Company, of 11, Victoria Street, Westminster, send us the details of their exhibits at the Building Exhibition, which we had no space to notice. Their Soundproof Hygienic Partitions when finished and plastered both sides with the Company's Quick-Drying Hygienic Cement, are less than 3 in. thick, and their strength is equal to that of a 4½ in. brick wall. The work can be executed without noise or dirt, and for partitioning off offices in a building, partly tenanted, is a valuable feature. The manufacturers tell us that the partitions are in themselves less than one-fifth the weight of 4½ brickwork, but the interlacing binding procured by their system of clamping renders them perfectly self-supporting from wall to wall, so that if necessary any portion of the wall may be cut out, which is done simply by sawing, for doorways, &c., without in the least degree weakening the partition. This property also avoids the necessity of using an iron joist to carry the wall, as the work can be built straight on to the wood-floor, which is a very imperfect method of construction. The absence of any woodwork in this structure should be a recommendation for its adoption, as the inconvenience of cracked walls and dry rot are thus entirely obviated, as also the open space which in a lath and plaster partitioning makes such a grand receptacle for vermin and dirt. The partitions are also sound resisting, and have been used in musical cubicles to stop the noise of piano practice with great success. The same methods of construction, as are applicable to the walls of buildings, are also used for the fireproofing of wooden joist floors, which does away with concrete and iron and acts as a pugging as well.

Messrs. H. J. & C. Major, Limited.

We were much struck with the quality of the self-locking tiles exhibited by Messrs. Major, at the recent "show" at the Agricultural Hall. The colour—if not equal to the Brosley—was good and very even, and if the manufacturers can guarantee that a high wind would not strip their roof, we should gladly recommend them to the attention of our readers. The address of Messrs. Major, is Bridgwater, Somersetshire.

The residents of New Cross, Brockley, and Nunhead have a new open space. On Saturday, at half-past two, Mr. Arthur Arnold, chairman of the L.C.C., opened Telegraph Hill, which will be to the South of London what Primrose Hill is to the North—the elevation being very high and commanding fine views of the city—but it is more picturesque, being provided with two miniature lakes, some grass plots nicely laid out, and a bandstand.

In carrying out the work of restoration of the Chapter House of Durham Cathedral, as a memorial to the late Bishop Lightfoot, the workmen have unearthed the seat and sides of the ancient stone chair in which the bishops of the see from Carileph to Barrington had been successively installed.

Correspondence.

The Editor welcomes Correspondence on matters of general interest. Gentlemen thus addressing the Editor should condense their communications as much as possible.

THE Holland (Lincolnshire) County Council has decided to place an order with a Belgian firm for nearly 2,000 tons of granite for the main roads, instead of securing the whole of their supplies from the English quarries. The Councilors calculate that by this means they are saving 1s. 3d. a ton. The Council has previously placed orders with a Belgian firm in consequence of the cost of English granite owing to the heavy railway rates.

An enquiry has been held at Darlington into the application of the Town Council for sanction to a loan of £8,000 towards the cost of erecting a technical school. The total cost of the building will be from £15,000 to £16,000.

SOCIETY MEETINGS.

Glasgow Architectural Association.—The monthly meeting was held in the rooms, 114, West Campbell-street, on Tuesday evening last, Mr. A. N. Paterson, President, in the chair, when the secretary, Mr. Walter R. Watson, read a paper on "Sir Christopher Wren." The essayist gave an historical and descriptive account of England in the middle of the 17th century, and explained the state of general science and the architectural practice of the period. The chief events of Wren's interesting and eventful career were then alluded to, notably the visit to Paris, and it was showed under what advantageous circumstances that visit was made. Referring to the circumstance that Wren, unknown even as an architectural amateur, was selected to assist the surveyor-general, the lecturer remarked that he was at that time, more than any other man in the kingdom, equal to anything of national importance that might be required. His love for architecture was only a part of his sympathy for everything that could appeal to a man of genius. Had there been no mathematician of eminence besides himself, nor any remarkable poet, painter, or sculptor, Wren would have been all or any of these, as the necessity of the time might have required. The second part of the paper was devoted to a description of a few of the great architect's better-known works, and was illustrated by diagrams, photographs, &c.

Surrey Archæological Society.—The fortieth annual meeting of this Society was recently held at 8, Danes Inn, Strand, when the President, Viscount Midleton, occupied the chair. The report stated that the Council took this opportunity of returning the thanks of the Society to all who assisted in rendering the meeting successful. The part of the Society's "Collections" (vol. xii., part i.) for the year 1894 was issued to all members not in arrear with their subscriptions. In this part is a valuable paper on "Compton Church," by Mr. J. L. André, F.S.A., and one on "The Manor of Lambeth," by Mr. S. W. Kershaw, F.S.A. The catalogue of church plate is still being continued, as are also the extracts from Surrey wills. The "Visitation of Surrey" is drawing to a close, and the editors hope to finish it in the next part. The library still further continues to increase by exchanges from kindred societies, but from lack of funds it is impossible to keep up the binding of the various "Transactions" received. The number of members is 313. During the year 14 new members have been elected. By death the Society has lost 4 members, and by resignation 7 members; total 11: gain over loss, 3 members. Although not strictly within the limit of this report, the Council desires to refer to two events which have occurred in the early part of the year 1895. The first is to record the loss the Society has sustained in the death of Mr. J. W. Butterworth, a vice-president, and one of the founders of the Society. The second event to which the Council desires to refer is the issue of the "Calendar of the Feet of Fines for the County of Surrey, from Richard I. to Henry VII." For those working on the early history of the county, this Calendar will prove of the greatest service, for there is no calendar to this class of document in the Public Record Office. Mr. J. F. Eastwood said the Surrey County Council was about to build a science and art building at Kingston, which was to contain a county museum, and it was a question whether the County Council would receive and show their collections for them.

Dundee Institute of Architecture.—The first annual dinner of the Dundee Institute of Architecture, Science and Art, was held in the Royal Hotel, Dundee, on Friday night. Bailie Keith, President of the Institute, occupied the chair.

AN exhibition of railway appliances and inventions is to be one of the features of interest in the forthcoming summer season of the Imperial Institute. The display is to be held in connection with the International Railway Congress, which is to be opened by the Prince of Wales in June, and it will be located in special buildings in the south-east quadrangle of the Institute.

SAWDUST.

WE regret to announce the sudden death of Mr. T. C. Wakelin, Architect, of Merthyr, which occurred on the 3rd instant.

THE tender of Mr. H. A. Forse, for the erection of schools at Victoria Park, has been accepted by the Bristol School Board. The amount is £10,000.

THE re-opening of St. George's Church, Hanover Square, London, has been postponed until after Easter, in consequence of the electric organ not being completed.

THE illuminating power of gas largely depends on the shape of the burner employed. The smaller and thinner the flame, the more rapid the consumption, and the less the light.

A PAPER is to be read at the Society of Arts at an early meeting after Easter by Mr. R. E. Crompton, the well-known electric engineer, on "The Use of Electricity for Cooking and Heating."

THE Whalley sewerage works contract has been let to Mr. John Sharples, of Accrington, for £3,619, subject to the schedule of prices for extra work being altered to the satisfaction of Mr. Diggle, the engineer.

LORD MORLEY'S Committee of the House of Lords on Monday, passed the bill authorising the Edinburgh and District water trustees to borrow £750,000 for the construction of new works for obtaining an additional supply of water.

ACCORDING to the latest reports, there are in the World 140,384 miles of submarine telegraph cable. Of this total the various Governments own 14,480 miles of cable and 21,550 miles of wires. The balance is owned by private companies.

IT is with regret we announce the death of Mr. Thomas Andrew Sugden, of Keighley, formerly a member of the firm of Sugden and Smith, architects. Mr. Sugden, who was for a few years a member of the Keighley Local Board of Health, was 75 years of age.

OUT of 70 candidates, Mr. H. Ashton Hill, A.M.I.C.E., gas and water engineer to the Wallasey District Council, has been appointed to the post of chief engineer to the South Staffordshire Waterworks Company, at a commencing salary of £600 per annum.

THE Highway Committee of Blackburn, out of 59 applicants, has selected Mr. Thomas Vickers, aged 27, as assistant engineer. The salary is £130 per annum. The successful candidate served his articles with the late Mr. McCullum, Blackburn, borough surveyor.

A NEW Primitive Methodist Chapel is to be built at Wesham, Lancashire. The contract is let to Mr. W. Tomlinson, who expects to have the work completed in about six months. The site is on Garstang New Road. The architects are Messrs. Paley, Austen and Paley, of Lancaster.

MADAME SARAH BERNHARDT is said to have purchased a little island in the Bay of Naples, once owned by Fouquet, and in a castle there, which she means to restore to the semblance of its ancient architectural dignity, she intends to reside in periods of temporary retirement from the stage.

At the meeting of the Wetherby Union Board of Guardians and Rural District Council, held on Thursday, it was resolved that the Committee be instructed to procure an architect to draw up plans for an isolation hospital, at a cost of about £1,000.

THE new Baptist school-chapel in Brynland Avenue, Horfield, will be Late Gothic in character. Mr. Herbert J. Jones, of Bridge Street, Bristol, is the architect, and Messrs. R. Williams and Sons, of Surrey Street, in the same city, have taken the building contract at £2,100.

It is proposed to appropriate about 1,108 square yards of the piece of land on the south side of Burlington Street, Liverpool, for the construction of a free open-air bath, with all necessary offices, &c., at a cost of not exceeding £700, subject to the bath and buildings connected therewith being so constructed as to permit of the widening of Burlington Street.

THE memorial-stones have been laid of a new Wesleyan school-chapel at Lower Bebington, Liverpool, the erection of which has become necessary by the rapid growth of Port Sunlight. The complete scheme, which includes the erection of a new school at Port Ferry, will cost £3,000.

At the Russian town of Reni, at the junction of the Pruth and the Danube, a rich find was made lately of gold coins of the time of Philip of Macedon, the father of Alexander the Great. They are in excellent preservation, and 512 of them have already been seized by the police and sent to St. Petersburg.

RECENTLY Colonel A. G. Durnford, R.E., an inspector of the Local Government Board, attended at the Council chamber to hold an inquiry into the application of the County Council for permission to borrow £127,280 for the erection of a West Sussex lunatic asylum at Grayling Wells, Chichester.

AN application has been made by the Cheshire County Council, to which no opposition was offered, to borrow £80,000 for the purpose of extending the Upton Lunatic Asylum. Plans have been prepared by Mr. Grayson of Liverpool. The enlargement will provide accommodation for 416 additional patients, and will also embrace large farm buildings.

NEWS is to hand from South Africa, stating that Mr. W. T. Olive has been elected City Engineer for Cape Town, at a salary of £800 a year, and £200 extra for works in connection with the main drainage of the city. Mr. Olive was formerly chief engineer and assistant to the Manchester city surveyor, and during his ten years stay in that city prepared and carried out the works for the relief of floods.

At the last meeting of the Liverpool County Council it was agreed—first, to apply to the Local Government Board to borrow £40,000 for the building of new fire station buildings in Hatton Garden, and, secondly, to accept the tender of Messrs. J. Paterson and Sons, Soho Street, Liverpool, for the erection and completion of the buildings for the sum of £30,770. Plans of the proposed buildings were exhibited.

THE Wombwell Conservative Club in Park Street, Barnsley was struck by lightning during the storm last Tuesday. The iron stanchion used for more securely fixing the pinnacle in its place was torn from its bed, and with the stone work thrown down, and the electric current, tearing along the coping, knocked off the coping stones, and seriously damaged the slating of the roof. The club premises are of a strong substantial character, having been erected some seven or eight years ago especially for the use of the club; and although the roof was damaged the building itself seems to have suffered no injury.

At the monthly meeting of the Carlyle Society, held at Anderton's Hotel, London, Dr. Eugene Oswald, who presided, said that the committee formed to purchase Carlyle's house, Cheyne Row, Chelsea, as a national memorial, had up to the present received the sum of £1,612 in subscriptions, the German Emperor having forwarded a donation of £100. A large sum had been collected for the object in America. A sum of £1,750 was required for the purchase of the house, and, in addition, it had been decided to raise a further sum of £2,400, as a sustentation fund. The acquisition of the house now seemed practically assured.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the work.

BATHAMPTON.—For building School at Bathampton, near Bath. Mr. W. J. Wilcox, Architect, 1, Belmont, Bath:—

LIVERPOOL.—For construction of covered service reservoir at Breeze Hill:—
Holme and King (accepted) ... £16,661 7 7

LONDON.—For proposed re-building of The Globe p.h., Borough-road, S.E., for Mr. George Evans. Mr. W. M. Bruton, architect:—

Rowe ...	£2,350	0 0
Courtney and Fairbairn ...	2,257	0 0
Hooper, T. ...	2,239	0 0
Whitehead ...	2,220	0 0
Edwards and Medway ...	2,216	0 0
Holloway ...	2,200	0 0

LONDON.—For external painting and repairs required to be done at the Licensed Victuallers' Asylum, Asylum-road, Old Kent-road, London. Mr. W. T. Potter, architect. Quantities prepared by Mr. C. R. Griffiths, 31, Farnival-street, Holborn, E.C.:—

Collings, W. H., and Co., Old-street ...	£1,049	0 0
Smith, W., Kennington ...	821	0 0
Walker, J., Poplar ...	694	0 0
Dawes, F., Peckham Rye ...	595	0 0
Pritchard and Renwick, Southwark ...	570	0 0
Hollingsworth, H. H., Peckham ...	559	0 0
Hayworth, S., and Sons, Kingsland* ...	497	0 0

*Accepted.

**LADDERS, BARROWS, STEPS,
TRESTLES, SCAFFOLDING,
For Sale or Hire.**

J. BATCHELAR & CO.,
48, HAMMERSMITH ROAD, W.

LONDON.—For constructing new offices for the boys and teachers of the Compton-street School, Goswell-road, for the London School Board:—

Knight and Son ...	£1,390	0 0
Kirby and Chase ...	1,380	0 0
Mallet, H. ...	1,187	0 0
Newton, G., Southwark-street, S.E.* ...	1,175	0 0

*Accepted.

LUTON.—For residence, shop, and bakehouse, Crawley-road, for Mr. D. Starkings. Mr. A. Wilkinson, architect:—

Saunders, J. ...	£1,456	0 0
Parkins, D. ...	1,380	0 0
Smart, G. ...	1,200	0 0
Kingham, G.* ...	985	0 0

* Accepted subject to amendment.

(All of Luton.)

LUTON.—For residence and stabling, Dunstable-road, for Mr. W. Withington. Mr. A. Wilkinson, Cardiff-road, architect:—

Dunham, W. G. ...	£997	0 0
Parkins, D. ...	887	0 0
Saunders, J. ...	810	0 0
Smart, G. (accepted) ...	735	0 0

(All of Luton.)

MORLEY (Yorks.).—Accepted for the erection of mill premises, Brentcliffe-lane, for Mr. B. P. Hepworth. Mr. T. A. Buttery, architect, Exchange Buildings, Queen-street, Morley. Quantities by the architect:—

Clegg, J., and Sons, Wesley-street, Morley, masonry, bricklaying, and excavating ...	£2,540	0 0
Auty, William, Chopell-hill, Morley, plumbing ...	58	17 0
Haley, E. and W., Bradford, iron-founding ...	435	0 0
Bently, John, Howdenclough, concreting ...	247	0 0
Atkinson, John, and Son, Leeds, slating ...	407	0 0

Total ... £3,687 17 0

MORLEY (Yorks.).—For the erection of hall and reading-rooms, Fountain-street, for the Temperance Society. Mr. T. A. Buttery, architect, Queen-street, Morley:—

Furness, D., Morley, masonry ...	£750	0 0
Hook, J., Armley, joinery ...	392	0 0
Wilson, E., Morley, plastering ...	125	0 0
Naylor, M. A., Morley, plumbing ...	76	0 0
Atkinson, J., and Son, Leeds, slating ...	50	9 0

NEWPORT.—For the rebuilding of two shops in Commercial-road, Newport, Mon., for Mr. F. E. Burpitt. Mr. E. A. Lansdowne, architect:—

Parfitt, A. E. ...	£1,020	0 0
Webb, T. ...	979	0 0
Reed, C. H. ...	962	0 0
Hatherley and Carr ...	950	0 0
Firbank, J. H. ...	948	0 0
Dimond, F. G. ...	940	0 0
Linton, J. ...	920	0 0
Jones, W., and Son ...	919	0 0
Jenkins, J. ...	910	0 0
Moore, W. ...	900	0 0
Price, W. ...	890	0 0
Lock, C. ...	875	0 0
Williams, R. ...	844	0 0
Richards, D. W., Newport* ...	838	0 0

(Accepted.)

WOODFORD.—For the erection of a dwelling-house in Churchfields, for Mr. R. N. Salter. Mr. J. Walter Wyles P.A.S.L., 7, Finsbury-pavement, E.C., architect:—

Mundy ...	£1,250	0 0
Reed ...	1,139	0 0
Catley ...	1,070	0 0
Jolliffe ...	1,018	0 0
Osborn and Sons ...	993	0 0
Slow and Punter* ...	925	0 0

* Accepted with modifications.

WORCESTER.—For alterations and additions to Draycott House, near Worcester, for Colonel Scott, R.A. Mr. A. William West, 44B, Maddox-street, W., architect:—

Steed, London ...	£2,077	0 0
Underhill ...	1,847	0 0
Stokes and Sons ...	1,779	0 0
Wood and Sons ...	1,779	0 0
Bromage and Evans ...	1,671	0 0

Rest of Worcester.

Reading Cases may be had on application to the Manager. Price, 2s. each.

COMPETITIONS.

BELFAST AND COUNTY DOWN RAILWAY.

COMPETITION FOR PROPOSED HOTEL AT NEWCASTLE.

Alfred Waterhouse, Esq., R.A., and the Directors have to-day awarded the prizes as follows:—

1st Prize.—James J. Farrall, Esq., M.R.I.A.I., 6, Westmoreland-street, Dublin.

2nd Prize.—Messrs. Gibson & Russell, 11, Gray's Inn-square, London.

3rd Prize.—Messrs. F. H. Tulloch & Lionel Littlewood, F.S.I., Albany-buildings, 39, Victoria-street, London.

All the plans sent in can, on application to the Secretary, be seen at the Belfast Terminus, by Architects and their friends, from TEN to FOUR o'clock daily from 1st to 6th APRIL, inclusive.

As the sealed envelopes of the other Competitors have not been opened, those of them who wish their names appended to their drawings should send in to the undersigned, a rough tracing of their block plan for identification.

THOS. J. BRITAIN,

Board Room, Belfast, Secretary.
March 29th, 1895.

TO ARCHITECTS.

THE FOX ALMSHOUSES TRUST.

DESIGNS, SPECIFICATIONS, AND ESTIMATES are invited by the Trustees of the late John Henry Fox, for not less than TWELVE, and not more than FIFTEEN, ALMSHOUSES to be erected on ground at Norton, near Stockton-on-Tees. Each almshouse to contain one sitting-room and one bed-room, with a kitchen behind and necessary out-offices. The superficial size of each sitting-room and bed-room must be 12ft. square or equal thereto. Also a room to be used as a common room, equal to 20ft. by 20ft., and a clerk's office, and a porter's lodge. The ground site is at present covered with buildings which will be cleared by the Trustees, who propose to appropriate as much of the ground as can be made available for an ornamental pleasure ground for the inmates. The cost of the required buildings must not exceed £2,500.

A plan of the site can be seen, and copies obtained, and all further information had at the office of the undersigned.

A prize of £20 will be given for the design which the Trustees may accept, and £10 for next in merit. If the architect whose design is accepted shall be disappointed architect for the work, the prize money shall be accounted for as part of his commission.

Designs, specifications and estimates are to be sent to the undersigned under a non-de-plume, accompanied by the name and address of the Competitor in sealed envelope, not later than the 13th day of MAY, 1895.

H. STOWELL CROSBY, Solicitor,
Clerk to the Trustees.

80, High-street, Stockton-on-Tees.

SMOKEY CHIMNEYS & DEFECTIVE VENTILATION.

THE "DULCE DOMUM" CHIMNEY TOPS & VENTILATORS (Downes' Patent).

The only Chimney Top which can be easily swept with the Ordinary Apparatus without being damaged. A Positive Preventative of Down-Draught, so Constructed that it Creates a Continuous and Powerful Up-Draught. Simple in Construction having No Movable Parts, Nothing to Oil or Repair. Cannot Get Out of Order. Strongly Made in Galvanised Iron. Once Fixed will Last for Years. Applicable also for Ventilating Public Buildings, &c.

Builders' &c., testimonials can be seen and prices obtained at the Patentee's Offices:—

11, THE PARADE, Lewisham High Rd., New Cross, LONDON, S.E.

Gambling in Architecture.

THE flutter in the Architectural dovecote of Dublin over the result of the Portrairie Lunatic Asylum Competition is merely the periodic return of the big, black bogie of disappointment. In this particular instance competitive designs were invited for a lunatic asylum for the Richmond district, Portrairie, Dublin, and the cost of the whole thing was not to exceed £200,000. Twelve schemes were submitted, and the judges—Dr. J. M. Moody, of Cane Hill Asylum, Mr. G. P. Hine, of London, and Mr. Sydney Mitchell, of Edinburgh—instead of assessing the respective merits of the three best sets, simply bracketed all three together and left it to the wisdom of the Board of Governors, which had appointed them, to make a final selection from the premiated sets. It happens that one of the most pronounced "conditions" issued to competitors was the item of cost—"Economy of construction, and economy of working supervision and future extension," being strongly pointed. Two out of the three selected schemes had respected this condition, the other had ignored it, and by that means was able to produce a much more effective design. The Board of Governors—being composed of atoms of ordinary humanity—swallowed their conscience and the bait, and selected the author of the more effective set of drawings to carry out the work, *after* he has reduced the scheme down to the limit of the £200,000. The lucky competitor is Mr. G. C. Ashlin, R.H.A., a man perfectly capable of carrying through the work, but Mr. W. Kaye Parry, F.R.I.A.I., of Dublin—they also go in for alphabetical distinction in the Emerald Isle—has kicked against the pricks, and the decision of the Board of Governors, and has addressed a lengthy grumble to the Council of the Royal Institute of Architects of Ireland. We think Mr. W. Kaye Parry was perfectly justified in

his disappointment, in his grumble, and in the action he has taken, but he would have been far wiser to have given a good hearty laugh at the result and gone home profited by the experience. The Council of the Institute have replied to the "memorial" of Mr. Parry in the very excellent method of Councils. It deprecates the action of the Board; the assessors were not justified in doing this; they were not consistent in doing that; no opportunity should have been afforded to the other; and so on. No doubt this is balm to Mr. Parry's heart, but nobody but the authors of the other premiated designs care a brass farthing about it. It is extremely rough on conscientious men who accept restrictions and frame their schemes as closely as they can upon them, but we have, "in other places," frequently advised competitors to study human nature a little more and the con-

BUNGALOW COMPETITION.—THIRD PREMIATED DESIGN, BY D. B. DOBSON.

ditions of their work a little less. The modern system of competing for artistic work is a curse. Every architect admits it, especially *after* he has been successful once or twice; and one has only to turn to the big public buildings of our largest towns to see the awful mistakes the competitive system has to answer for. But then it is the only means of unearthing buried talent, and there is not so much of that running to seed that we can honestly disown all affinity between good work and competitions. At best, and at worst, it is a gamble, and as in all species of gambling, those who "know something" invariably come out top side.

Slow Revival. Slow but sure, we trust, are these signs of revival in the Australian building trades. The official reports that came last week, dated the end of February, are certainly of a re-assuring nature, not so much on account of the extra business actually done as from the indications afforded that the end of the prolonged depression has been reached. Australia has suffered even more than America from the wild and reckless jerrymandering of the speculator and the bogus financier. These new countries cannot support such a suicidal policy and retain their credit in the money market. It takes an old country, full of revenue and resource, and, we may add, respectability, to effectively face impending ruin and survive. Australia has practically been ruined, and she has her inherent English determination and her governmental association with the Mother Country to thank for having emerged from the crisis without perpetual paralysis. The attack was sharp, sudden; some thought fatal, but these reckoned without British blood and bone. We are, in our quiet way, a great believer in the force and energy, the art and labour of Britain, and so, even amid the thunder of bank crashes there was hope. This hope appears to be on the way towards security, though it is true that the respective Governments and private enterprise are timid still in building. The Australian Year Book tells of continued stagnation in architecture, but this may be because the slow and upward movement in building has not, so far, dared to call in Art and the muses. Plain buildings for utility's sake are ventured, while daintiness, or dignity, or decoration is kept in abeyance. But should the revival be sincere and strong, it will not be very long before the higher and happier inspirations are invoked and buildings shall rise, fair to see, and of noble origin and influence. At present Sydney and Melbourne are remembering their ambitions and are going in for external colour decoration. Those architects busy, seem to lean to the

Jacobean, following in the wake of our home tendency. New South Wales would appear to have been the most vigorous colony and the quickest in recovery. Over a quarter of million of money has been spent by the Government, mostly in the extension of buildings already in existence. Colleges, hospitals, asylums and schools constitute the major portion of the new work. Private enterprise has followed the sensible, if limited, lead of the Government. But when you come to consider styles you find more variety. Victoria, having suffered much, has spent little, and that little in repairs and additions. The same tale is told of Queensland and of South Australia, while Western Australia hardly yet counts in solid building. Yet, and notwithstanding all this, the individual trades bound up in building report renewed, if a modest, activity, and an all round improvement is eagerly expected and somewhat confidently anticipated. Melbourne is moving in iron. Iron tubing and builders' hardware, and better qualities of goods can be sold, and at Sydney building materials are actually going up in price. It is true that the galvanised roof still holds a good deal more than its own, and is progressing to the dismay of architects who can do little or nothing with this material. In New Zealand, happily, buildings are in demand, and can be sold at moderate profits. South Australia's home brand of "Portland cement" having been pronounced so excellent, and equal to the "English variety" should come in useful for its neighbour, and may establish stucco throughout the Australasian colonies, though we hope not. However, from many small straws, such as these, the highest Australian discerns the way of the wind, and that wind is "favourable." We wish it would blow our way, too.

A Little Brief Authority. A CASE was brought against Mr. Iliffe, a newspaper proprietor, by the Urban Sanitary Authority of Coventry. He was summoned for a breach of the building laws. This, we do not pretend to say, is singular; many men are guilty of common offences, and men who build are not yet too good for this World. But the details against the defendant showed somewhat of the temper in which these little parochial authorities approach building matters to the parade of their little brief authority. It was alleged that the defendant sent in plans for a large show, with showroom and stores above; also with back premises. Subsequently, a further plan was sent in for a stock-room over the said back premises. Now a vigilant official discovered that defendant had converted his premises to other uses after having had them built, the plans, we presume, having been passed in the first instance. For this and for some slight irregularity at the rear the defendant was summoned. His architect, Mr. Quick, stated that plans for conversion of upper rooms had not been sent in it was true, but defendant was not aware of this. Moreover, the new premises were "an ornament to the street," in place of old dilapidated buildings. The Bench imposed a nominal fine, but the case opens up the somewhat serious nature of urban and all other "authorised" interference. A man puts up a new block, changes his mind as to the use of his rooms, prefers bed-rooms to store-rooms after all, and is promptly pounced down upon by the authority. Truly, authorities are fearfully and wonderfully made, and we might add marvellously multiplied!

[“The Institute and the A.A.”—We had intended completing this article in the present issue, but such a mass of information and opinion has reached us that we deem it better to hold it over until next week. Ed.]

COMBINATIONS OF METALS.

A COMBINATION of copper and zinc makes bell metal, a variety of bronze of which bells are made.

A combination of tin and copper makes bronze metal, with a preponderance of copper.

A combination of tin, antimony, copper and bismuth, makes britannia metal.

A combination of tin and copper makes cannon metal.

A combination of copper and zinc makes Dutch gold.

A combination of copper, nickel and zinc, with sometimes a little iron and tin, makes German silver.

A combination of gold and copper makes standard gold.

A combination of gold, copper and silver makes old standard gold.

A combination of tin and copper makes gun metal.

A combination of copper and zinc makes mosaic gold.

A combination of lead and a little arsenic makes sheet metal.

A combination of silver and copper makes standard silver.

A combination of tin and lead makes solder.

A combination of lead and antimony makes type metal.

A combination of copper and arsenic makes white copper.

A combination of tin and lead makes pewter.

THE COLOUR DECORATION OF GOTHIC CHURCHES.

IN the great Gothic churches of our own country colour has rarely been employed on the exterior and always in a restrained manner and without injury to the general harmony, for the colour on porches and in niches is altogether insignificant in this point of view, and, besides, there is nothing to show that it was not added long after the erection of the structure on which it is found. One of the things most to be admired in these vast edifices is the art, or, if you will, the luck by which the builders have succeeded without colour, by having recourse only to Architecture and Sculpture, in giving to the exterior of the edifices a variety which in no respect injures the imposing effect of the whole. If we now regard the interior of these churches, the magic of the colour of the stained windows will complete the enjoyments the sight can receive from colour allied to Architecture, enjoyments which can only strengthen the power of the religious sentiment in those who enter these edifices to address their prayers to the God of Christians. If all the influences of painting have from the beginning really concurred with Architecture, and even with painted Sculpture, in the interior decoration of Gothic churches, it can only have been in a secondary degree, from the time when it had been decided to put in windows of stained glass, for no painting applied upon an opaque body, such as stone and wood, could sustain itself beside the brilliant coloured light transmitted by the glass. And if this painting had been graduated according to the rules of chiaroscuro, all its merit would have disappeared for want of pure and white light, the only kind suitable for illuminating it. Is it true that the vicinity of stained glass necessarily requires, as an effect of harmony, painting on contiguous walls? Without deciding absolutely in favour of the contrary opinion, it is to be confessed that, after reflecting also upon the deep impression received in great Gothic churches, where the walls present only the simple effect of light and shade upon an uniform surface of stone, where there are no colours except those transmitted by the stained glass, the sight of more varied effects would have appeared an error.

THE SYMBOLISM OF COLOUR.

THE symbolism of colour reached a transcendental point in the Byzantine school of religious painting, which still governs art in the Greek Church. We are so fortunate as to possess the actual code of rules drawn up to regulate it. This most curious manuscript—inspired, as the Orthodox believe—is kept at the famous monastery on Mount Athos. It was written by a monk, named Dionysius, in the tenth century; but he alleges, truly, no doubt, that he used a much earlier edition. The unbroken persistence, or rather identity of types in the Greek religious pictures, from the seventh century to the present day, had perplexed all who studied them until this discovery explained it. Not a detail is left to the artist's fancy. Not the Virgin only but every Saint whom he would be likely to depict is catalogued to the minutest touch—features, hair, attitude, equipment, and colour. It is roundly enacted that the flesh of all holy personages must be "yellow," and yellow it was, as we see, for ages. But in the last century Truth revolted against this item. Orthodoxy shuddered, and it found an uncompromising champion in a painter named Stroganoff, whose school is still honoured. He admitted that the code of Dionysius should be reformed. The flesh tints of a saint ought to be not yellow but dark green, and all the truly pious agree with him to this day. Symbolism could not go beyond that. Most obvious of all is red, to signify anger, hence, by a natural deduction, authority. Haroun Alrashid, we are told, used to dress in red when he felt inclined for an outburst. The Persian Shahs maintained this tradition until the present reign. Burton mentions that the Sultan of Darfur put on a red cashmere turban when he meant mischief, and the despatch of a red dress to any subject was an order to commit suicide. In China alone, perhaps, is red the colour of happiness and peace; the Celestial will always be an exception. Even white has been or is abhorred by some races, perhaps for the reason which Herodotus suggested in the case of the Egyptians, who hated a white pigeon—it reminded them of leprosy. All white animals are disliked in India. The Niger tribes sacrifice an albino upon occasions of great importance, but, perhaps, this is an honourable distinction. Palgrave notes a strange peculiarity of the Arab race in the matter of colour. They "habitually confound" green, brown, and black, using the words without discrimination, though, when challenged, they know the difference. Thus, for example, they say a mulatto is "green," a quadroon "grass green," an octoroon "emerald." Nowadays we can suggest an explanation which would scarcely have occurred to Palgrave. Arabs may be subject to a peculiar form of colour blindness. That curious malady indeed was recognised by science more than a hundred years ago, but the public resolutely declined to credit it. Regarding Arab colour-blindness, it may be observed that some etymologists derive not a few of our European names for tints from that language and the Persian. Thus "lake" is *lakki*; crimson, *germez*; "azure," *lazwerde*; the two last seem complex, but we transcribe faithfully. "Lilac" evidently is the Persian *lailak*, and "strawberry" applied to a horse, comes, no doubt, from the French *aubère*, which, it is likely, may be a corruption of the Spanish *hobero*; and in that case, perhaps, it is derived from the Arabic *habari*, bustard-colour, the plumage of that bird being mottled. But as for a French word *jargon* signifying "orange," and coming from the Persian *zergoun*—in the first place we demand evidence that there is any such word. And when it comes to deriving *rouge* from *arjwan* the mystery becomes too deep for sounding. But there is no improbability in the assertion that many of our colour names have been adapted from Oriental tongues. The industry and the civilisation of the Moors in Spain, whilst Christian Europe was a den of savages, would have that effect. Nearly all our names for "stuffs" of the luxurious class are Oriental.

THE spring meeting of the Iron and Steel Institute will be held in London, on Thursday and Friday, May 9 and 10 next.

A CHAT WITH THE MASTER OF THE ARCHITECTURAL SCHOOL OF THE ROYAL ACADEMY.

THE STORY OF NORMAN SHAW'S WITHDRAWAL FROM THE INSTITUTE.

IF it was not that your mission was an important one, and the knowledge that Mr. R. Phené Spiers could enlighten you on many matters connected with the vexed question of examinations and architectural teachings in general, no prospective chat with any mortal being would have prompted you away from the glorious balm of the first spring afternoon, and beyond the sunshine which lifted all the heaviness and vexations out of one's existence.

It would not be just to say that Mr. Spiers was eager for the fray, he was merely ready, as all good workers are at any moment, to do battle in the cause they hold to be sacred. And surely there is no man more competent than he to gauge the mode of warfare. The surroundings were not inducive of contention. The little room in Carlton Chambers smacked of an earlier day. A few Dutch

tiles upon the mantelpiece and bits of various ware; a Scriptural oil or two upon the walls; a dozen or more water-colour sketches of country houses, very un-English, but very pure in style, severe and unaffected; a small collection of pamphlets and books, one of which, to-day is extremely useful. Mr. Spiers had gathered into one volume all the printed matter connected with the Institute examinations; there it was, beginning with Mr. Ashpitel's paper on Voluntary Examinations, read before the Architectural Association, on the 29th of November, 1862. This paper was the outcome of advances made by the Committee of the Architectural Association to the Institute that an examination should be instituted toward which the students might fashion their own work in the classes of the Association.

"Now, mark the development," says Mr. Spiers, still retaining possession of his precious book. "In January of 1863 the first examination was held, and again the following year, but there was a feeling of insecurity about the whole thing. You got nothing for your pains; no certificate; not even a letter from the Secretary; nothing but a notification in the Transactions that Thomason Swift had satisfied the Examiners of the Royal Institute of British Architects."

"Why was that?"

"One hardly knows! except that in those days the profession was somewhat like an omnibus, and the passengers inside, considering it was full, kept their knees together against all comers."

"In 1865 there were no candidates for examination."

"Really!"

"In '66 a few were scraped together, but in '67, '68 and '69 the scheme utterly failed. In 1870 a Preliminary was started, as it was feared the requirements of the Examiners had been too stiff, but both examinations dragged slowly along."

"And yet the energy of the Institute did not succumb?"

"Undoubtedly, no! But in 1882 the Compulsory Examinations were commenced, entitling the successful men to nomination for election as Associates of the Institute."

"And these Compulsory Examinations have been successful?"

"Yes; 641 candidates have passed, and during the ten years from '82 to '92 there have been an average of thirty men come up from the Architectural Association."

"And that is why you think, Mr. Spiers, that if the Examinations were suddenly stopped the A. A. would expire in three or four years?"

"Precisely. My expression was somewhat figurative. But I believe that many young men go through the classes of the A. A. in order to pass the requirements for membership of the Institute?"

Not being prepared to vouch for the individual integrity of the A. A. students I changed the subject. "Do you possess an opinion, Mr. Spiers, upon the Association itself?"

"I do. It is the most remarkable Institution I know of. No other profession in the World can show its equal. In any other country but this it would be impossible. Mutual and self-help, as you know, was the watchword in the earlier days, but the classes became too numerous, and now the Association has out-grown its initial ambitions and pays over seven hundred pounds a year in Lecturers' fees."

"Young men, young blood, new schools, new ideals, Mr. Spiers." But Mr. Spiers was discreetly not listening at the moment.

Mr. Spiers speaks with the utmost authority upon the Architectural School of the Royal Academy, for he has never released the reins of mastership since he first took them up, more than twenty years ago. It is quite true, he sadly admits, that the attendance is frightfully below what it should be, and all the inducements held out to students do not seem to bring them in. The stability of an architectural student is an unknown quantity. Students enter at the beginning of the term, but the staying power diminishes rapidly and fades away almost before serious work is started. The average attendance is too low even to be mentioned.

Before the chat ended, and you were once more in the delightful sunlight outside, we ventured upon discussing the Institute and many things connected therewith. But Mr. Spiers is of the old brigade and perhaps the wiser for it. He sees difficulties and appreciates them; he sees errors which he would wish retrieved; he sees rocks and knows the trouble in navigating round them, but as if he feared the difficulties were as apparent to you as to himself, he exhorts you to keep a perfectly free and open mind upon all things.

When we got to discussing men and matters, Mr. Phené Spiers spoke of the wonderful initiative of the late G. E. Street, and what good he did for the Academy Schools, and then, most interesting of all, how it was Norman Shaw came to sever himself from the Institute. In early days Shaw and Nesfield were in partnership, and occupied the same suite of offices. They had both just joined the Institute as Associates, when Professor Donaldson called to see Mr. Shaw to ask him to read a paper. Shaw was not in, but he saw Nesfield and told him he also

would be expected to deliver a paper at the Institute."

"What paper?" asked Nesfield.

"What paper!" replied the Professor, in mock horror—"What paper; don't you know that all Members of the Institute are *expected* to read a paper?"

Poor Nesfield protested that he had never read a paper in his life, and Donaldson retorted that it was an excellent time to begin.

Nesfield, taking Donaldson seriously, consulted Norman Shaw, who likewise affirmed that he had never written a paper in his life and never intended to.

"What's to be done?" queried Nesfield.

"Resign," laconically came from Shaw, and their resignations were posted the same night.

HOW TO PREVENT DRY ROT.

DRY rot is a misnomer. This disease in timber ought to be designated a decomposition of wood by its own internal juices, which have become vitiated for want of a free circulation of air. If you rear a piece of timber, newly cut down, in an upright position in the open air, it will last for ages. Put a piece of the same tree into a ship or into a house, where there is no access to the fresh air, and ere long it will be decomposed. But should you have painted the piece of wood which you placed in an upright position, it will not last long, because, the paint having stopped up its pores, the incarcerated juices have become vitiated, and have caused the wood to rot. Nine times in ten wood is painted too soon. The upright unpainted posts in the houses of our ancestors, though exposed to the heats of summer and the blasts of winter, have lasted for centuries, because the pores of the wood were not closed by any external application of tar or paint, and thus the juices had an opportunity of drying up gradually. On making some alterations in a passage, the writer put down and painted a new plinth, made of the best and apparently well-seasoned foreign deal. The stone wall was fast with wood and laths, and the plaster was so well worked to the plinth that it might be said to have been air tight. In about four months a yellow fungus was perceived to ooze out betwixt the bottom of the plinth and the flags, and on taking up the plinth, both it and the laths and the ends of the upright pieces of wood to which the laths had been nailed were found in as complete a state of decomposition as though they had been buried in a hot bed. Part of these materials exhibited the appearance of what is usually called dry rot, and part was still moist, with fungus on it sending forth a very disagreeable odour. A new plinth was immediately put down, and holes $1\frac{1}{2}$ inch in diameter at every yard were bored through it. This admitted a free circulation of air, and to this day the wood is as sound and good as the day on which it was first put down. If, then, you admit a free circulation of air to the timber which is used in a house (no difficult matter), and abstain from painting that timber till it be perfectly seasoned, you will never suffer from what is called dry rot.

MR. THOMAS TAYLOR, Queen Street, Oldham, is the architect of the new Board Schools in course of erection at Afghan Street, Derker, a suburb of Oldham. They consist of two distinct buildings, a Mixed School accommodating 1,120 scholars, and arranged as a Central Hall, with Class Rooms on ground floor, and gallery level, and an Infants' School for 33 children. The walling is of plastic bricks, and the floors of wooden blocks laid on concrete. The contract for foundations has been let to Mr. Whitworth Whittaker, of Oldham.

* One of the old bye-laws stated that on election every member was expected to read a paper or make a donation to the Library.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
16th April, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

THE spring meeting of the Iron and Steel Institute will be held in London on Thursday and Friday, May 9th and 10th next. The building operations at the Civil Engineers will prevent the meeting being held at their house, as has been the usual practice, and it will accordingly be held at the rooms of the Society of Arts. The presidential address will be delivered by Mr. David Dale, and the Bessemer gold medal will be awarded to Mr. H. M. Howe, the distinguished American metallurgist, who will contribute a paper on the hardening of steel. Mr. Stead, of Middlesbrough, will contribute a paper of great practical importance on the effect of arsenic on steel; Mr. Sergius Kern, Metallurgist to the Russian Admiralty, will discuss the manufacture of armour-piercing projectiles in that country; Mr. Herbert Scott will communicate a paper on the iron ore mines of Elba; and Mr. W. J. Keep, of Detroit, U.S.A., will contribute a paper on tests of cast iron.

If one, Mr. Richard Parry is to be believed, the majority of those persons on the look-out for a desirable residence had better expend their energies outside London. In an interesting paper read before the members of the Auctioneers' Institute, Mr. Parry summarised the essentials of a desirable residence as follows: (1) Well built, (2) dry, (3) well ventilated, (4) well drained, (5) supplied with good water, (6) well lighted, (7) well warmed, and (8) well planned. Mr. Parry noted the tendency of not only the wealthy, but the middle classes, to seek professional advice on the question of purchasing or taking houses for residence, and urged that, after a purchase, if dissatisfaction should arise through defects in part of the house not mentioned in the professional report, the surveyor should be discredited. Mr. Parry should have warned his audience against purchasing houses erected by incompetent persons without the assistance of an architect.

THE Art Loan Exhibition at Guildhall is in so forward a state as regards the reception and hanging of the treasures lent by their owners, that the Library Committee of the Corporation is enabled to fix the ceremonial opening by the Lord Mayor for Saturday, the 20th instant, which day, and also Monday, the 22nd, will be reserved for "private views," admission being by ticket. The Queen is again a contributor.

A NEW Pulpit and Baptismal Font for the Catholic Church at Malton, Yorks, have been erected. The Pulpit is of Caen stone, and is in the Decorated Gothic of the thirteenth century. The front is divided into five panels, with coves and angles, showing beaded mul-

lions and arches over recesses deeply sunk, with plate tracery, trefoils, quarterfoils, &c. There is an ornamental book-rest, supported by mouldings from mullions and cornice above. The sides are pierced, and show beautiful examples of bar tracery, to correspond with the front. There are two plain panels between plinth and string, which are left for carving to be done hereafter. The Pulpit is fixed against the south wall of the Church immediately outside the communion-rail, and is entered from the sanctuary between two ornamental pillars. The work has been executed by Mr. Lyons, of Norton, near Malton. The Baptismal Font, which harmonises admirably with the Altar, Pulpit, and other architectural features of the Church, is the gift of Mr. Lyons. The base is of Robin Hood stone, polished; the shaft and capital, of Roche Abbey magnesian limestone, circular and moulded. The Font itself is of Carrara marble, octagonally planned. The lid, of dark brown oak with brass fittings, assumes the form of a cone, surmounted by a cross. The Font stands in the south-west corner of the Church, and has the following inscription carved on the base: "Ex dono Antonii Lyons, A.D. 1895."

THE German Department of Telegraphs has been carrying on an investigation with a view to determining what effect the telephone wires in cities have on atmospheric electricity—whether the danger from lightning is increased or decreased by the presence of the miles of wire now necessary in cities in which the telephone is extensively used. The result of the investigation has been to show that the wires tend to weaken the severity of thunderstorms and to decrease the danger from lightning. From information received from 340 cities with telephone wires, and from 560 without them, it appears that the danger of damage by lightning in the two classes is as 1 to 4·6. Although, as is the common experience, the danger from lightning is greater in the country than in cities, and it is therefore to be expected that the towns without telephones, which are generally country villages, should show a greater percentage of damage by lightning than large cities, yet the difference cannot be more than 50 per cent.; while in the figures just given it is seen that places without telephones are almost five times more liable to damage by lightning than the places with telephones. A further interesting point is this, that in the places without telephones, five lightning strokes on the average occur during every hour of thunderstorm activity, while in cities with telephones only three occur. It appears, therefore, that the presence of many wires in our cities is a protection against damage by lightning, a rather singular, if safe, conclusion.

THE Parish Council of Barrow, near Leicester, has been the first to distinguish itself by defying a Government Department. By the Act of 1894, where the area of the Burial Board is co-terminous with the parish, the Council takes over all the duties and powers of the old board. They are bound to provide a burial ground for the parish, either within or without it, and to divide it into two parts, consecrated and unconsecrated (16-17 Vic., c. 134, s. 7), or to provide separate and distinct burial grounds (20-21 Vic., c. 81, s. 3), and for this they must obtain the approval of the Home Secretary, and this the men of Barrow have failed to secure. The action of the Home Office is awaited with curiosity.

YET another "poster problem." The C.C. will now have to adjust its spectacles and adjudicate upon Mr. Julius Price's striking poster for "An Artist's Model" now upon the hoardings. The Vigilance Association objects to models of any kind, and

Sir John Bridge is to be asked, in the first place, for his opinion. This obtained, no doubt the C.C. will be busy. This poster is a picture of a very prepossessing young lady whose attire, whatever it may be, is concealed by a large palette which she is holding out in front of her. There have been threats and remonstrances and protests and reports. The police authorities took official possession of a copy, which is to be reported upon by an expert. If it is hung up in Scotland Yard, it will do something to give a much-needed touch of cheerfulness to that sombre building. It is objected to by some people on the ground that, although it undoubtedly gives the idea of an artist's model in professional attire, still it conveys a false impression as to the richness of the costumes in the play. Sir John Bridge seems to be in the enjoyment of a happy time, but it is a good thing for him that only one "Model" holds the legal field—or rather, we should have written, "wall!"

UNDER section 25 of the Metropolitan Gas Act of 1860, London gas should be tested against the light of sperm candles of six to the pound, each burning 120 grains an hour. Avoiding mathematical perplexities, this is equivalent to the illuminating power of 16½ candles. The question naturally arises as to the quality of the testing candle, and it is a question which can be fought out very acrimoniously by three parties—the gas referees, the companies, and the candle-makers. First, a sperm candle, or, as the technical authorities describe it, a spermaceti candle (which is composed of sperm and a proportion of wax to break the grain), is the best form of candle; a tallow, wax, or paraffin candle being of considerably less quality. Yet there are candle-makers and candle-makers, and one can produce a better article than another. But it may be gainsaid that, as the test candle alluded to is described in a most bewilderingly technical manner by the gas referees, so as to fulfil most detailed conditions of weight, quality, and make of wick, there should be no difficulty in satisfying the requirements of the Act. The fact remains, however, that the test candles vary, and that the gas companies are quite alive to the advantages of getting as poor a specimen of the test candle as possible, because even one candle power less than the 16½ means many thousands of pounds. The gas referees, in spite of their elaborate notification as to the methods of making test candles, actually suggest that the wicks should first be washed in distilled water before steeping them in the preparation with which they are "dressed." In the opinion of a well-known manufacturer, this is a very untechnical suggestion; but the fact is, the apparently prosaic art of candle-making is more occult than is generally supposed, and the secret of "dressing" wicks burns only in the breast of the maker, transmitted from father to son. The interest of the public should certainly be to obtain the best test candle which the Act allows.

AMONG many interesting and important objects of art recently sold at Christie's, the more notable were to be found in the valuable collection of silver and silver-gilt plate, removed from Wimpole Hall, Cambridge-shire, the seat of the Earl of Hardwicke. Very high prices were paid for examples of the work in silver of Paul Lamerie, among which were a large sugar-caster, chased with lions' masks, 11 in. high, dated 1740, £176 19s.; a circular flat bowl, with fluted border, chased with female heads and flowers, dated 1725, £266; a pair of two-handled cups and covers, with bands of openwork, strap ornaments and masks, 12½ in. high, dated 1723 and 1736, sold separately, but realising a total of £552 9s.; two oval soup tureens and covers, the handles formed as dolphins, also sold separately, and realising

a total of £430 16s.; a circular sideboard dish, the border richly chased with masks, scroll ornaments, &c., date 1725, £393 15s. Only buyers possessed of decent bank books had a look in, for old silver is very tempting—except to the poor—and they have no eye for these things unless one accounts the honest burglar poor.

THE Lord Mayor makes an appeal in the name of the Council on the Dwellings of the Poor. Sir Joseph Renals says: "During the past twelve months alone the paid inspectors working from the central office have made 7,759 visits to alleged insanitary properties, and such cases as were found necessary were reported to the local authorities with marked success. The expenses of the Council are not heavy, but, inasmuch as the measure of the work to be done is limited only by the resources of the fund at command, and as the Council has thoroughly established itself as a proved and trusted friend of the poor, I have no hesitation in asking the wealthier citizens of London and inhabitants of the Metropolis to strengthen the Council's hands by becoming annual subscribers, or by sending donations." It is needless to add that a Lord Mayor of London never appeals in vain.

THE fact that the sum of £750 was contributed in one evening is strong evidence that the people of Walsall appreciate that noble institution, the Walsall and District Hospital, which is so closely identified with the name of Sister Dora. But, to restore the building, £1,800, it is estimated, will be required; or, if medical wards are to be added, £3,000. In the town and surrounding districts are 40,000 workers, and it is suggested that each one of these should work one hour per day overtime for a week (a plan already adopted in some places), and allow the employers to pay the wages for the same to the fund. Then, probably, at least £2,500 would be realised from the working men alone—a sum sufficient, with that already in hand, not only to restore the damaged buildings, but to build the medical wards, which the town so greatly needs.

PRIMITIVE Architecture, we should have thought, would be the characteristic of the Cathedral on Wheels, run by the Right Rev. William David Walker, the Bishop of North Dakota. The "Cathedral" is a railway car specially built at Pullman, Illinois, at a cost of 3,000 dols., to visit the widely scattered villages on the lines of the Northern Pacific, Chicago, Milwaukee, and St. Paul, Great Northern, and "Soo" Railroads, within the limits of Northern Dakota. It is 64 feet long, and lo! its principal external feature is a Gothic projection or Transept! At one end is the Chancel, with altar, lectern, and font, and at one side is a cabinet organ. The body of the Cathedral is equipped with 80 chairs. In the rear of the Chancel is what Bishop Walker calls the episcopal palace. By day it serves as a study, rectory, robing room, and, on occasion, as a kitchen. At night a berth is let down, and the episcopal palace becomes the bishop's bed chamber. This

travelling Gothic is, surely, the latest attempt in Renaissance!

COMPARISONS of cost between the new Baltic Canal, soon to be opened, and the Manchester Ship Canal, accentuate the sad case of the latter. The German enterprise cost £7,800,000 for 61½ miles; the English £15,500,000 for 35½ miles. Their respective costs per mile were £126,858 and £436,619. It is true that they are widely differing enterprises; but one of the most important differences is connected with the fact that the original estimate for the German work has not been exceeded. The tendency of engineers to under-estimate has been successfully resisted by the Germans.

AN old Gobelin of the seventeenth century, hitherto kept in the Hohenzollern Museum, the work of Abraham Begyn, who went to Berlin from Holland in 1697, and was noted for his architectural perspective pictures, has just been repaired and taken to the Royal Palace in Berlin. It represents the deed of the great Churfurst, and measures about 5 yards high by 4 yards broad. The moth-eaten places having been repaired

caverns in the chalk having deep narrow vertical entrances" which exist in groups in various parts of England, especially along the Thames in Essex and Kent, and to which this name is applied, have been a puzzle to antiquaries from the time of Camden. The first scientific exploration of a group of deneholes was undertaken some years ago by the Essex Field Club at Hangman's Wood, near Grays, where within a space of four acres there are seventy-two of these pits. Each shaft is about eighty feet deep, and widens out at the bottom into a broad "vestibule," round which are ranged "six spacious crypt-like chambers" in a double trefoil pattern. A chamber is usually about thirty feet long, eleven or twelve wide, and eighteen high, and may lie towards any point of the compass. Deneholes cannot date back to the Stone Age, because the marks of the metal picks with which they were excavated are still quite fresh. Pre-historic man might have dug out the chalk in the search for flints, but Mr. Christy declares most positively that the flint bands which show in the sides of the chambers have never been worked out, as at the well-known pits at Brandon or Cissbury.

In early traditions these deneholes were regarded as the "deserted goldmines of the British King Cunobeline," but though they never yielded any mineral more precious than flint, this theory of their British origin cannot be disproved. It is just as hard to ascribe to them a definite purpose.

ALTHOUGH there is not to be a Domesday-book for London showing the various owners, we are to have a ground plan which will show the leading estates. It is reported that this scheme is making progress, and that 206 estates have been delineated on the map—representing one-fifth of the total area.

BUNGALOW COMPETITION: PLAN OF SECOND PREMIATED DESIGN, BY S. H. GODWIN.

with new threads, and the tarnished silver by new, the whole composition has regained its pristine brilliance. The subject is the siege of Stettin, with batteries and groups of generals and soldiers. A broad and rich border with warlike emblems surrounds the centre picture. The great Churfurst always intended to have the military acts of his reign represented in Gobelins, and after his death his successor religiously carried out his intentions. The value of this old Gobelin is estimated at about 300,000 marks.

THE New English Art Club showed signs of improvement in its last exhibition, but this year's show is less impressive. The pictures, for the most part, are of that wild impressionist style which characterised the earlier exhibitions of the club. There are, however, a few brilliant pieces of work, such as "A Portrait," by Mr. Roger E. Fry, and "Battersea Church," by Mr. C. E. Holloway. The exhibition is poor indeed in comparison with what was expected after the cultured and convincing work of last year.

MR. MILLER CHRISTY'S amusing paper "On Deneholes" in the *Reliquary*, will serve the useful purpose of letting people know what a denehole is. The "ancient artificial

THE widening of Wellington-street at its junction with the Strand is again being considered by the Improvements Committee. A former scheme was rejected because the freeholder, the Duchy of Lancaster, ruled out "betterment." It is now proposed to buy a narrow strip of land (1,096 square yards) at the eastern side of Wellington-street, which would widen the Strand at this point 64 ft. to 80 ft., by rounding off the corner. The leaseholder is the National Telephone Company, which is ready to sell for £6,000, while the Duchy requires £10,000 for the freehold. The Council would have to bear all costs and expenses of the sale, and would have to pave the new portion of the street. Would the Strand Board of Works contribute towards the cost? The Improvements Committee suggests that the present opportunity is a "very favourable one," and that "an expenditure of seven or eight times the present cost will have to be incurred in the near future, as is inevitable, if the improvement has to be carried out under the ordinary conditions of compensation."

UNDER the will of the late Mayor of Kendal (Alderman Wm. Bindloss), the testator bequeaths £3,000 as an additional sum to the £7,000 already given by him for a Chime of

Bells for the new Kendal Town Hall. He also bequeaths his family residence, Castle Green, Kendal, and surrounding land and buildings, together with Castle Green Farm adjoining, to the Kendal Corporation for the maintenance of the Kendal Town Hall; and £30,000 for the extension and improvement of the Kendal Water Supply. He also leaves £1,000 upon Trust for the purchase and conversion of his Hospital at Milnthorpe, near Kendal, into a block of Almshouses, together with £1,000 for maintenance of the same; £1,000 to the Royal Albert Asylum, Lancaster; £1,000 to the Westmoreland Schools, London; £200 to Kendal National Schools; £1,000 each to Middlesex Hospital, St. George's Hospital, and King's College Hospital, London; £1,000 to the Church of England Waifs and Strays Society; also a large number of private legacies—all free of duty.

EXTRAORDINARY enthusiasm has been aroused in Greece by the project of reviving the Olympian games. An Alexandrian merchant offers half-a-million drachmas—about £17,700 sterling—for the restoration of the Stadium, so that the games may take place on their proper ground, and with their ancient surroundings. It does not seem extravagant, after what has been done, to expect that his example will be contagious and that the work will be taken in hand. Whether it can be completed in time for next year's "international contests" is doubtful. But the construction of the Stadium was simple. It consisted of a hollow space scooped out of the ground, 680 feet long and 130 feet broad; and it was cut round into tiers for 40,000 spectators. These tiers were furnished by Herodes Atticus with Pentelic marble; and in marbles Greece is still one of the richest countries in the World. But will all the spectators wear sandals?

EARLY in June the new gallery of ancient paintings in the Palazzo Corsini in Rome, to be called the "Corsini Gallery," will be opened. It will be composed for the most part of paintings from the gallery of Prince Torlonia, and some ceded by the Government, hitherto kept in the ancient gallery of the Monte de Pietà, joined to those already existing in the Corsini Palace, which is now closed till the time appointed.

THE Bologna Academy of Sciences offers a prize of £40 for the best system of preventing or extinguishing fires by chemical, physical, or mechanical means. The competition is open to the World. Essays must reach the Secretary of the Academy not later than the end of May, 1896. They may be written in Latin, French, or Italian, but any other language is permitted, provided it is accompanied by an Italian translation.

LOVERS of illustration are beginning to protest against the ousting of the artist by the camera, and Sir Frank Lockwood did well to draw attention to the state of the young draughtsman walking from illustrated paper to illustrated paper with a portfolio of clever drawings under his arm. It is idle to deny that the camera may produce true works of art, and we are all quite willing to see it play its part in the illustrated journals of the day. But when it threatens the work of the pen and pencil, then reasonable warfare should be declared. The hand-camera will soon be a public nuisance. In France—where the mania for "snapping" everything and everybody is even keener than here—legislation is already on foot against it.

THE treasure-houses of Japan have hitherto been the Buddhist temples, for there has existed a close connection between that faith and the intellectual and æsthetic development

of the nation, a connection which does not exist in the case of the Shinto cult. No temple was without its examples, and the best works of Japan's finest artists and craftsmen were given as offerings either to the priesthood or to the shrine. At the close of the feudal period the temples lost the great endowments of land they had received in earlier times, and were thus deprived of a considerable source of revenue. This loss, to some extent, they made up by the sale of objects given by "pious founders," and it is thought that the priests have not always been careful to distinguish between those given to their fraternity and those intended as heirlooms of the shrine. To counteract this diminution of the national treasures, the Government decided to have a descriptive catalogue of them compiled by experts. This was not a very effective measure, for it was still possible to replace one object by another of inferior value, and to substitute a clever but worthless forgery for an original; and, apart from this, it is clear that many difficulties of identification must almost necessarily arise from time to time. The treasures of art are now to be gathered into the museums of Kyoto and Nara, and made available for the examination of students and for the inspection of the public. As there are 193,242 shrines and 72,154 temples, they must possess in the aggregate a very large amount of artistic material suitable for display in national museums of the kind now contemplated.

THE "Governor's Guide to Windsor Castle" is out. It is not cast in the mould of the ordinary guide-book, but is rather a popular little work on Windsor Castle. In other words, it is meant as much for the man who may never see Windsor Castle as for he who goes there with the guide in his hand. In so far that it deals with the visits of great notabilities like Louis Napoleon or the Tsar Alexander to Windsor, the volume has a personal note. It gives some sixty pictures and plans of Windsor. The "Governor," it may be remembered, is the Marquis of Lorne.

THE request, relative to the woodman sparing the tree will have to be adjusted a little, seeing that electricity is pushing its

another advantage. The charring of the surface of division increases the value of the timber by preventing decay. Eight trees may be felled by electricity while one is being brought down by axe and saw. So much for the good old woodman! The new force sweeps all before it.

BRAZILIANS are not satisfied with their present capital, Rio de Janeiro, which is not central, not very healthy, and perhaps not roomy enough. They are about to build themselves a brand new capital, embodying, as the projectors would say, every modern improvement. This was announced to the French Academy of Sciences by one of its members, M. Faye, who had just received a communication anent the new capital from Senhor Cruls, who appends to his name the substantial title of President of the Brazilian Committee of Preliminary Investigation for the Removal of the Capital of Brazil to the Centre of the States of the Confederation. Senhor Cruls states that the new federal capital will be built on the central plateau of Brazil, in a rectangle of about 25 miles long and seven broad—quite a city of magnificent distances, equal to anything in the United States. May not all this be permissibly described as a Capital suggestion?

WHILE New York has been trying to solve the problem of rapid transit within its borders by elevated railroads, and cable cars already in existence, and underground railroads, which so far are only projected, Brooklyn seems to have solved its problem by the introduction of the trolley system of electric cars, but the loss of life which has resulted so far has been something frightful to contemplate. The 105th victim killed in the streets of Brooklyn since the trolley system commenced its deadly work not more than two years ago, is recorded, to say nothing of the maimed and wounded, although it is only just to say that the number of maimed and wounded does not largely exceed the number of those who are killed outright. The accidents are usually quite fatal. In fact, the cars are constructed with trap doors in the bottom, so that the remains of a victim can be gathered up without resorting to the necessity of throwing the car off the track.

BUNGALOW COMPETITION.—WEST ELEVATION OF SECOND PREMIATED DESIGN.

way as a forest-feller. It is stated that on several estates trees have been felled by means of a platinum wire, stretched between two poles and used as a saw, heated to whiteness by electricity. The work is cleaner, and accomplished more quickly than by the old-fashioned method. The waste of sawdust is done away with. And there is

When one considers the fact that sometimes these cars are run at as high a rate as twenty miles an hour along the streets of some of the most populous districts of Brooklyn, the only wonder is that the deaths have not been more numerous than they have. The indignation against the trolley lines in Brooklyn has become so great that determined efforts

are being made to limit the rate of speed to something which will give a reasonable assurance of safety to the public.

A MOST prominent instance of a good property going begging was seen when Lord Dartmouth's residence, 55, Manchester Square, was recently put up at the London Auction Mart. Lord Dartmouth was chief Whip to the Conservative Party under the late Government, and is better known as Lord Lewisham. His residence, as was the case when it was previously offered twelve months ago, failed to elicit a bid. This is surprising considering the ridiculous price at which his lordship was prepared to sell. The house was occupied by Lord Dartmouth until his accession to the Peerage two or three years ago. It is mainly remarkable for its large square halls, with fine old mahogany staircase, and handsome reception rooms. It also contains a billiard-room, and was but recently modernised and decorated, under the direction of Professor Roger Smith, at a cost of £7,000. Not many years ago the lease—which at a ground rent of £60 per annum, has an unexpired term of 26 years—cost £8,000. Half that amount, however, it was announced, would now well satisfy Lord Dartmouth, notwithstanding the fact that in the course of last year he had refused offers of £3,800 and £4,000. Still there was no bid.

PLANS have been prepared by Mr. J. E. Leak, Architect, of Hunslet, for a block of new almshouses to be built through the generosity of the late Mr. Scott, of Hunslet, who left the sum of £10,000 to provide almshouses for ten poor people of the parish; one-half was to be spent in purchasing a site (which has been secured) and on the buildings, and the other half devoted to an endowment. The buildings will be of a substantial nature and in the Classic style.

THE Commissioners appointed to superintend the erection of the new public baths and wash-houses for the parish of St. Saviour, Southwark, may be congratulated upon very excellent results. The Commissioners appear to have seen that everything was substantially constructed. The first-class swimming bath, which has a water surface 100 ft. long by 30 ft. wide and a depth of 3½ ft. at the shallow end increasing to 6½ ft. at the deep, seemed to be one of the brightest and cleanest on the Surrey side of the Thames. The total cost, including £10,000 for the purchase of the freehold site, has been £40,000.

THE death, at the great age of 93, of Mr. Robert Fitch, the well-known archæologist and antiquarian, is recorded. Mr. Fitch was probably the oldest magistrate in the country. He was the author of a widely read book on "The Gates of Norwich," of which city he was at one time Sheriff. Formerly he possessed what was considered to be the finest private collection of antiquities in the kingdom. This collection he presented some years ago to the town of Norwich, and it is now located in what is known as the "Fitch" room at the Norwich Museum.

BELIEFS so general that they have become to be accepted as scientific facts, are often shattered by experiment. It has been considered as beyond question that iron becomes more brittle from the effect of cold, and that the dangers of railway travelling from the breakage of axles or rails are increased in frosty weather. Professor Dewar has communicated to the Royal Institution the result of a series of experiments proving indisputably that, so far from this being the case, the effect is precisely the opposite. The experiments were made with wires 2 in. long

and a tenth of an inch in diameter. The only exceptions were zinc, bismuth, and antimony, in all of which the tenacity was diminished instead of increased by the intense cold. These experiments prove the absolute fallacy of the popular belief, and show that the risk of accident is considerably diminished by the influence of excessive cold.

As the result of opening a stone-yard to all comers during the past winter, the Metropolitan Union of St. Olave has paid £7 a ton for the breaking of 2,500 tons of stone. Of course knack is required in this work, as in all other, and men unaccus-

BUNGALOW COMPETITION.—EAST ELEVATION OF SECOND PREMIATED DESIGN.

tomed to it do but poorly. But, allowing for this, and for the effect of paying those London men a weekly "living wage" instead of what they could earn on piece, it does seem that the Guardians of St. Olave's Union were entitled to grumble. It is computed that their pampered out-of-works—"Socialists," every man of them, no doubt—worked between 20 and 30 times less effectively than old men do along the highroads.

THE opportunity for comparing pictures by English masters with those of painters of the Continental schools is amply furnished in the forty-second exhibition of the French Gallery in Pall Mall. Works by Corot, Jacque, and Troyon, Lhermitte, Van Marcke, Heffner, Scheffer, and Heilbuth are to be found side by side with those by Constable, Morland, Gainsborough, Crome, Turner, Linnell, and Wilson. Nearly the whole of one wall is devoted to a dozen or more examples of a young artist, W. B. Tholen, who, if little is known of him in this country, has been the recipient of medals and honorary awards from many of the art societies of France, Belgium, Germany, and elsewhere. The gem of the collection in the way of landscape is, however, undoubtedly Turner's "St. Mark's Place, Venice," which came from the Novar, and afterwards passed into the Kirkman Hodgson collection.

THE last of a long line of "Millers of the Dee" recently died, and the Chester Town Council has resolved unanimously to purchase the historical Mills for £7,000, the object being to secure possession of the weir at the mills to improve the boating and navigation, and to prevent the flow of sewage up the river on the tides. It was stated that the grant of these Mills, with the fishing, was originally made by Edward VI.

WE are threatened with the extinction of the Seven Dials. At the meeting of the Board of Works for the district, it was proposed that application be made to the London County Council for an order incorporating Great St. Andrew Street and Little St. Andrew Street under the name of St. Andrew's Circus, St. Giles. The Post Office authorities, it was stated, were favourable to the suggested alteration, as no little inconvenience and confusion resulted from such a multiplicity of streets and thoroughfares of the same name in the Metropolis. Not only mistakes were made, but delays occurred in the delivery of important business letters

from the similarity of street nomenclature. The Seven Dials for centuries bore an evil reputation, although according to Evelyn it was originally laid out in the reign of the second Charles for wealthy and aristocratic tenants, and was mentioned by the poet Gay as

That famed and ancient spot,
Where to seven streets seven dials count their day,
And from each other catch the circling ray.

Its glory has, however, long departed, and recently it has acquired unenviable reputation and notoriety as the headquarters of a band of young thieves known as the "Hooked or Crooked Stick Brigade." After some discussion, it was agreed to refer the subject, with the memorials of the inhabitants of the Seven Dials and St. Andrew Street, to the Works Committee.

So the Roman villa recently unearthed at the pretty little village of Darenth, in Kent, is attracting a large number of visitors. Many of these, no doubt, are impelled by pure curiosity, but the majority give the impression of being learned in antiquarian lore. It may interest architects to know that the nearest station is Farningham Road, on the London, Chatham, and Dover Railway, about twenty minutes from the discovered ruins—quite an agreeable little walk.

SIR FREDERIC LEIGHTON, Bart., P.R.A., has, in obedience to the orders of his medical adviser, left England for two months. It is requested that during his absence all letters on business matters be addressed to the Secretary of the Royal Academy of Arts, Piccadilly, W.

A NEW Chancel has been lately added to St. Thomas's Church, Seaford, which was built in 1815 by the late Sir John Gladstone, and in which Mr. W. E. Gladstone, the present patron, worshipped as a boy.

ARCHITECTURE AND THE EISTEDDFOD.

STUDENTS should know that next year's Welsh Eisteddfod will offer prizes for architectural designs, sculpture, and carving. We append particulars;

ARCHITECTURE.—Set of Measured Drawings of an Old Building, drawn to $\frac{1}{4}$ scale with selection of full-sized mouldings, prize £5 5s. Design of an Elementary Public School, suitable for 400 scholars, the cost not to exceed £12 per head, drawn to $\frac{1}{4}$ scale, perspective optional, £10 10s. Set of Plans of one or more, of a Row of Workmen's Cottages, which could be let at 4s. per week, drawn to $\frac{1}{4}$ scale, £6 6s. Set of Plans of Farm Buildings, suitable for a mixed farm of 60 to 80 acres, drawn $\frac{1}{4}$ scale, £10. (Open to architectural students and assistants under 25 years of age.)

SCULPTURE AND CARVING.—Modelling in Clay of a Head, from life, to be executed in the presence of the adjudicators in two hours; prize, £3 3s. Panel in Clay, size 3 ft. by 2 ft., the subject to be emblematical of the National Eisteddfod, either figures or coat of arms; prize £2 2s. Carved Chimney-piece in hardwood (open to amateurs only), £3 3s. Carved Case in oak of a Grandfather's Clock; prize, £5.

SMITHS.—Wrought-iron Gate, 4 ft., for hanging on stone pillar, and suitable for villa, not to exceed in cost £5; prize, £3. Length (about 6 ft.) of Wrought-iron Railing 2 ft. 6 in. high, not to exceed in cost 17s. 6d. per yard; prize, £2.

VENETIAN MOSAIC WORK.

THE British Consul at Venice has just sent home a very interesting report on the lately revived art of working in mosaic as practised at Venice, which we learn therefrom is now employed chiefly in the internal and external astistic decoration of private and public buildings there, and which is now carried on uninterruptedly on a large scale and with great success there. A mosaic is a work formed by the use of "tesserae," or small cubes of enamel, marble, or other material, and of a gold and silver leaf between two films of the purest glass of various colours, which are skilfully fixed on cement so as to produce the effect of a picture. The composition of human figures in different attitudes, animals, draperies, or other objects requiring a careful delineation, are entrusted to the best workmen, and the execution of the back-ground to less trained workmen. The splendid mosaics which are made at Venice continue to be in great demand in the artistic markets of the world, for the skilful manner in which the tesserae are arranged, for their extreme beauty and delicacy of colour, the rich harmony of effect, and from their being nearly indestructible. The manner in which mosaics are now made for decorative purposes is quite different from the elaborate system used by the ancients, which consisted in fixing the tesserae one by one on the cement previously applied on the wall. The modern method of the Venetian school consists in executing the mosaic in the workshop, by having the tesserae fixed with common paste on the section of the cartoon assigned to each workman. When all the parts of the mosaic are complete, they are put together on the floor, or on a special wooden frame. The mosaic, which is then a perfect representation of the original cartoon, is again divided into sections on the reverse side, marked with a progressive number, and carefully packed to be sent off to the place for which it is intended. The surface of the wall where the mosaic is to be fixed is then covered with cement, into which the sections of the mosaic are uniformly pressed, according to their numbers and the key plan supplied to the fixers. When the cement has hardened, the paper on which the tesserae have been pasted is gently taken off, and the faithful copy of the original cartoon is again exhibited on the right side.

The Builders' Journal.

MEN WHO BUILD.

No. 10.

MR. COLE A. ADAMS.

WHAT I have done and been able to do, lies more in the past than in the present."

You had sent a message to Mr. Adams, and his reply contained this sentence. He was not desirous of posing as a celebrity. He had evidently mistaken your request. He was a better man than he deemed himself to be.

A very dreary thoroughfare is Victoria street, Westminster. It possesses but one single specimen of architectural merit; the rest is a conglomeration of debased design and fiendish taste. The air in the street always seems moist and cool, as if the sun were ashamed to look at it. A story runs that behind one of the hoardings thistles and nettles have flourished for twenty years. They are not lonely. There are thistles and nettles of architectural art all round, and the nearer you approach them the more they sting. The road is wide—its only virtue—and George Augustus Sala still hangs his banners on the outer walls, what time that flowers are plentiful, and the trailing blooms are strong enough to stand the treatment of a London summer. Sala seems quite alone in his attempt to add a speck of colour to the most colourless street in the Metropolis; and, although your tastes and his do not fit over matters architectural, he is worthy of respect for many of his archæological loves and hatreds. In this street, at Princes Mansions, constructed of terra cotta of a particularly offensive colour, Mr. Cole A. Adams finds peace, the while he overlooks the drill grounds of the London Scottish, and gets a peep, across the canyon—of the District Railway—at the Niagara Rotunda, devoted to the pleasures of a sixty thousand pound skating rink. His love for colour—the harmonies and grandeur of good colour—must be inborn, unless he brings it daily from his home in Sutton Court, for there are no influences, no subtle suggestions, no inspiring surroundings in Westminster. It is not so much as a colourist, or as an architect who may or may not have enjoyed a large practice, that you spend an hour with Mr. Adams, but to gather from

him, a thoughtful and experienced man, some of the conclusions he has arrived at upon architectural ethics. It must be more than ten years since he first occupied the chair of the Architectural Association, and his presidential address still remains the best that has ever been delivered. He has a peculiarly rich and resonant voice, given to but few of his fellow practitioners to possess, and there is a studied reasoning in all he says, and a tinge of unbelief as if he had weighed life in

the balance and found it wanting. In the old days he travelled a bit; no time, however, in Italy, the glorious land of colour; but he has made up a little for his loss by designing and executing with his own hands the decorations of his ceiling. Some day he will finish his work; it is always good to have something that wants doing in the future. His room possesses two fine old cabinets, of one of which he whispers to you that it has never been near Wardour street. It is really a beautiful old seventeenth century Dutchman, far finer than the specimen at South Kensington.

Mr. Adams, in speaking of the Architectural Association, remembers, so he tells you,

WOODCLIFFE HOUSE.—MR. COLE A. ADAMS, ARCHITECT.

the delightful year of office he had in Conduit street. His recollections of the Association of course go back farther than that, to the days, when self-help and mutual study were coupled with the "Design in beauty, build in truth," and when, so he thinks, it was the better for it. He himself had no finger in the "New Scheme" of 1882. He doubted its wisdom; and although it has shewn to have had no ill effects,—although men still come willingly to swell the ranks, yet he has a sneaking fondness for the days when each man helped the other, and a strong vein of good fellowship bound all together. Things change, says Cole A. Adams, and not always for the best.

Mr. Adams was the first Member of the Council of the Institute to officially represent the Architectural Association. It happened in this way. The Committee of the Architectural Association being invited by the Institute to vote for one of the candidates at

cannot examine a barrister in the art of pleading, and is not *that* the one thing for which he studies? There were at least half a dozen other instances in which you could *not* examine, and every one of them went home to the uttermost point of conviction. But away for the time present with perplexing details of this broil. Mr. Adams can go back to his own student days with more relish, and seriously criticises the modern fashion of sketching. He vividly remembers returning from a fortnights sketching tour with many evidences of his labour. With glee he presented the drawings to his master and proudly awaited his praise. It came. The sketches were handed back, with this laconic judgment written in red ink in the corner, "How much prettier these would have been, covered with figures." Since then pretty sketches have had no place in Mr. Adams' heart. "Measure and sketch, sketch and measure," is what Fergusson

refrains from doing it is no matter of the World's, nor of yours; it merely demonstrates the love of peace that has filled him these many years; peace, which allows the swifter man to win the race for commissions, but leaves *him* satisfied with the self-satisfying conviction that what he has done he has done well, and what he has missed doing, would have been better done, had he himself done it.

AN ASSYRIAN PALACE.

A VISITOR was ushered in through the portal, guarded by the colossal lions or bulls of white alabaster. In the first hall he found himself surrounded by the sculptured records of the empire. Battles, sieges, triumphs, the exploits of the chase, the ceremonies of religion, were portrayed on the walls, sculptured in alabaster, and painted in gorgeous colours. Under each picture were engraved, in characters filled

A HOUSE, NEAR PRESTEIGNE: MR. COLE A. ADAMS, ARCHITECT.

the forthcoming election of its Council, Mr. Adams—then in the chair—replied that his Association, consisting of nearly a thousand men, should, in the opinion of himself and his Committee, have an official representative on the Council of the parent body. The suggestion was instantly accepted by the Institute, and the President himself was sent up to become the first representative. Since then the President of the Association is, practically speaking, an *ex officio* Councillor of the Institute. Talking of these things with Mr. Adams naturally leads one to the red rag of examinations, and once more you are thrown off the conviction that it is possible to determine the artistic capacity of a candidate by examining him. Mr. Adams believes that you can't. And he believes—in his belief—strongly and firmly, and brings many tantalising similes to prove it. You cannot examine a medical man, says Mr. Adams, in what I will call the delicate demeanour of the bedside, and is not that one of the "arts" of the physician? You

advocated, and that is the cry of this man of colour. For many years the colour class of the Architectural Association over which Mr. Cole A. Adams has presided has been one of the most successful held, and this, curiously, in face of the fact that more and more the architect is losing hold of colour, and calling in the services of the professional decorator. It is a pity, of course, but after all we are not a nation of colourists; and outside the natural colour of materials used in the internal construction of our homes we do little. Your chat with Mr. Adams—as interesting as it possibly could be—does not lead itself to the manufacture of copy; more surely does it build up that vast mass of conflicting evidence which goes to prove that all is not good architecture that looks it. Mr. Adams has devoted a fairly full life of toil to the faculty of getting to the bottom of things—of architectural things, and there is no man in the profession who could better throw light upon the dark spots of Architectural practice than he. That he

up with bright copper, inscriptions describing the scenes represented. Above the sculptures were painted other events—the king, attended by his eunuchs and warriors, receiving his prisoners, entering into alliance with other monarchs, or performing some sacred duty. These representations were enclosed in coloured borders of elaborate and elegant design. The emblematic tree, winged bulls and monstrous animals were conspicuous amongst the ornaments. At the upper end of the hall was the colossal figure of the king in adoration before the supreme deity, or receiving from his eunuch the holy cup. He was attended by warriors, bearing his arms, and by the priests or presiding divinities. His robes, and those of his followers, were adorned with groups of figures, animals and flowers, all painted with brilliant colours. The stranger trod upon alabaster slabs, each bearing an inscription recording the titles, genealogy, and achievements of the great king, and doorways, formed by gigantic winged lions, led away into other rooms.

THE LAST OF SOHO!

THE fame of Soho, Birmingham, has existed for more than a hundred years, but in a few months the great work will be lost or ever. The Soho House, where Matthew Boulton lived, with lavish courtesies to all the famous people of the last century, still remains as a School of Art. The old Soho Works, so well known, and so famous as "the toyshop of Europe," and the development of the vast houses of steam-power, the rare and graceful products of skill and fashion, for all parts of the World, the huge and busy workshops which were the "sights of Soho," and the admiration of all who saw them, secured for Soho unrivalled fame. Half a century ago the times and fashions had changed, and in 1850 the works were slowly dismantled, and scarcely a relic now remains. The "Old Pool" was drained in 1860 or 1861; the picturesque trees which surrounded the

which was developed and increased, partly by Matthew Boulton, and in later years by the genius and industry and skill of William Murdock in 1809, when solid cylinders were bored, special slide-valves invented, oscillating engines perfected, models of locomotives made, gas-lighting purified and perfected, and the area and powers of the foundry were marvellously improved. In 1850, when "Soho" was dismantled and broken up and sold, the coinage was removed to the foundry, and continued and extended with marvellous skill and success, especially in the bronze coinage, which has never needed alteration or correction, and which produced enormous quantities of the familiar coins. Matthew Boulton himself, not merely an able business man, but an able mechanic, designed all his presses and dies, and his work has remained unchanged and unchallenged down to our own times. Fortunately, although the old works are to

growth of nearly all the great industries of Soho. In many cases the details of wages, the costs of materials, estimates, &c., are preserved. The letters, not only of Boulton and Watt to each other, but those of Murdock, Creighton, Southern, and Buckle, the famous "Soho" men, almost innumerable letters from the most eminent scientific men of the past eighty to one hundred years, number, all told, about 15,000. All of these are full of interest, and have great historic value. Many of the minor inventions, as models, of Watt and Murdock, have been carefully preserved and endorsed; and rare engravings, the original letters patent, and daily records and incidents of scientific value, have happily been saved from loss. Most of these have been unseen and unknown, and might readily have been lost, but some years ago the manager (Mr. W. Henry Darlington) collected and arranged the mass of papers, drawings and relics, and

DESIGN FOR CEILING: BY MR. COLE A. ADAMS.

works were felled; the vast manufactory, which had been growing for nearly a hundred years, with the fine and handsome Soho House, was rapidly surrounded by the modern builder, and the eight various branches of industry—"Buttons in general, buckles and latches, silver and plated goods, medals and rolled metals, mint for Government coin, mercantile trade, ironfoundry and steam engines, and letter-copying machines," the pleasant views, and the keepers' cottages were doomed and lost for ever, leaving scarcely "a wrack behind." One portion of the works which had been added by Boulton in 1775 and completed in 1776 was, however, an important establishment, although at a considerable distance from "Soho." It was provided partly as a relief from the crowded workshops in the original building on Soho Hill, and over the Great Pool, and partly for the manufacture and finishing of heavy work and machinery, for boring, drilling, lathes, cylinders, and especially for foundry work,

be dismantled, there are some relics of great interest, and even of historic value. The machinery may be removed and disposed of, but the records remain. These include nearly all the books, drawings and plans which have been preserved for nearly a century and a half; the books of letters, wages and drawings have, happily, been preserved, and form an unrivalled mass of facts relating to the founding, development and growth of one of the largest and most interesting departments of a great and famous industrial enterprise for more than a hundred years. Excepting the Plantin Museum, at Antwerp, where a printing office of the sixteenth century has been preserved intact, with its presses and types, and where even stray "proofs" have been kept, there is probably no other record so extensive as the relics of the Soho Foundry to be found anywhere. The drawings and papers include the growth and progress of all kinds of work, the history of the steam-engine, the development of gas-lighting, the

placed them in a special room, where they were overhauled and preserved—a record-room which is unrivalled and which will be found to be not merely curious, but a unique summary of industrial history and of national progress.

THE competition for the District Council Buildings for New Hunstanton, Norfolk, has just been decided, the plans of Messrs. George J. & F. W. Skipper, architects, of Norwich, being unanimously selected. Four other architects (all of London) were invited to submit plans. The amount to be expended is £2,000.

SOME concern is felt as to the scheme initiated for the building of a Church to take the place of St. John's, at Buxton, inasmuch as it has been found that the foundations of the edifice now standing are solid and all right, but elsewhere is understood to be not solid. Sir Arthur Blomfield, who has had the matter placed in his hands, has tested the earth about the site, and we understand that no solid foundation can be found, although a depth of 27 feet has been tested.

A MODEL TECHNICAL SCHOOL.

BIRMINGHAM'S NEW BUILDING APPROACHING COMPLETION.

THE well-equipped Technical School for Birmingham, the erection of which was commenced about eighteen months ago, is now rapidly approaching completion, and there is reason to believe that by the time the winter session is opened in October next the teachers and students will be in possession of their new home. As a building it will be one of the most impressive edifices in Birmingham. It is very prominently situated, and there is no local building of modern construction to compare with it in its general aspect, for it possesses the distinction of being the only public building in Birmingham, with the exception of the Town Hall, which can boast of three elevations. The total area of land occupied by the school is about 3,000 yards, and the building is four storeys in height from the ground floor. The frontage to Suffolk street measures 120 ft., and the frontage to Summer street is 130 ft., the depth between the two streets being 208 ft. The principal elevation faces the former street, and the building will be surmounted by a central turret, which is in process of construction, and will terminate with a large weather-vane. The style of architecture adopted is that of the English

also contain allegorical groups of figures. The entrance is flanked on either side by a pair of enriched columns with an entablature bearing the words, in terra-cotta, "Technical School," worked between the triglyphs in the frieze. From the entrance hall a bold flight of steps, 16 ft. wide, leads to the staircase hall on the ground-floor level. The assembly or examination room is a spacious apartment, 45 ft. wide, 70 ft. long, and 20 ft. high, which is lighted from one side by four large mullioned windows, and will be enriched by an ornate terra-cotta dado, 14 ft. high, arched, and richly moulded. Above this will be a frieze 5 ft. high, which will probably be decorated at some future time with a procession of the trades of Birmingham. The ceiling is to be panelled in squares and richly moulded. Next to the examination hall is a commodious library, 45 ft. by 40 ft. On every floor there are two spacious corridors communicating with the staircases, so that every facility is provided the students for obtaining access to any particular room in the building. The staircases are arched and moulded in terra-cotta, and the corridors are lined with brown glazed bricks and terra-cotta, the windows being finished in terra-cotta outside and inside. On the first floor is the physics department, with a large lecture-room adjoining, the

and a small lecture-room. The iron and steel shop is 56 ft. wide by 45 ft. long; and on the opposite side of the basement is the brass shop (80 ft. long and 20 ft. wide), the pattern makers' shop, and the metal-plate and plumbing shop. Outside the main building, but in the school-yard, is a two-storey building, the floor at the basement level being set apart for the accommodation of the metallurgical plant, the accumulators in connection with the electric lighting, and a smithy. Below this, in the sub-basement, is the engine-room (40 ft. wide by 36 ft. long), which contains the gas-engines for supplying the motive power to the school and driving the electric-light plant, adjoining this room being the apartment containing the heating apparatus, the foundry, and rooms for teaching die-sinking and stamping. In the construction of the school everything that is possible has been accomplished for the comfort, convenience, and safety of the students, and under the supervision of the architects, Messrs. Essex, Nicol & Goodman, every effort will be made to make the institution a model of what a great technical training school should be. The total cost of the building, furnishing and fitting up of the school, will be about £70,000.

THE wooden Bridge over the river between Waterloo Place and Grant Street, Inverness,

BUNGALOW COMPETITION: A PERSPECTIVE SKETCH BY "VIOLET."

Renaissance, with bold gables and mullioned windows, the arches being elliptical in preference to semi-circular or pointed. To relieve the elevation it is well buttressed, a practical advantage which is enhanced by the fact that it has given the architects an opportunity of securing windows very much larger than they otherwise would have been. The building is erected of red brick, with buff terra-cotta mullions and dressings to the windows and the cornices, the terra-cotta being in all cases taken through the walls. The principal entrance is in Suffolk street, the elliptical arch being boldly moulded and richly ornamented in terra-cotta. The four swing-doors are approached by six steps, and open into a spacious hall, 28 ft. wide, 16 ft. long, and 28 ft. high, the walls being lined with terra-cotta. Beneath the arch at the entrance are three panels of terra-cotta sculpture, descriptive of various subjects taught in the school. The centre panel represents an ancient school of alchemists, with a background of Grecian pillars, the students being grouped around the teacher. On one side of this panel is a modelled group of figures representing chemistry, astronomy, and physics, and on the other side a group illustrative of the iron and steel industries. The spandrels

chemistry lecture-room, and the electrical engineering and telegraphic laboratories, the dynamo-room, and an apartment for applied physics. The second floor is principally set apart for the women's department, but it also contains class rooms for botany, geology, and chemistry, and sanitary museums. On the third floor is situated the chemical laboratory, the main room, the largest in the building, being 100 feet long by 56 feet wide. This room is lighted almost entirely from a glass-roof, which is carried upon open lattice girders and iron trusses. On the fourth floor well-lighted rooms have been erected for the study of building construction and geometry. Returning to the entrance hall, there are still two floors to be inspected. The first is called the lower ground floor. On this floor is the metallurgical laboratory, which is scarcely of less size than the large chemistry laboratory, being 100 ft. long by 45 ft. wide. Near it is the electro metallurgical and bronzing laboratory, 56 ft. by 30 ft., as well as several small lecture-rooms, &c. Adjoining Summer street are lecture-rooms, the metallurgical museum, and the carpenters' shop. The basement contains the metallurgical lecture-room and preparation-room, the mechanical laboratory,

will soon be a thing of the past. The Rose Street Foundry Company are the contractors for the erection of the new Bridge. Designed by Mr. J. A. Mackenzie, the Burgh Surveyor, the new Grant Street Bridge will be a handsome structure. It will stand upon four pairs of piers formed of cement, bound and encased in metal cylinders. These cylinders are 7 ft. in diameter, and will go down about 14 ft. into the bed of the river. There will be a massive stone abutment at either end, and these and the pilasters surmounting the piers will be capped with lamps. The span of the lattice girders is about 70 ft., and the entire length of the structure is 350 ft. The carriageway of the Bridge will be 18 ft. wide, and there will be a footpath 5 ft. wide on each side of the carriage way.

A MOVEMENT is on foot for the bridging of Lough Corrib, county Galway, at a point where it converges to a narrow isthmus of about a quarter of a mile across. The coastline of the lake is seventy miles long, and the people at one side of the narrow isthmus have to make half the circuit of the lake with all but the very lightest kind of traffic. The movement has the support of practically every one in the district concerned.

ANCIENT ART OF PREPARING PAINTS.

IT is matter for regret that the subjects of the works of the great masters have been entirely lost, as also are many of the secrets of colouring with which they were possessed. The description by Sir Humphrey Davy of his explorations among the baths of Titus, at Damascus, the decorations of which were of a most magnificent character, gives us some idea of the accustomed voluptuousness of the time. These decorations were only to be seen by torchlight, and are worthy of note. They are still regarded by connoisseurs as performances of great excellence, and the minor ornaments have given rise to that style of painting which ought rather to be called Romanesque than Arabesque. That there is a lost art in preparing paint is undoubtedly true, for none of the beautiful painting—or rather colouring—of the Vatican can at the present day be equalled. Sir Humphrey Davy found, in the baths of Titus and the ruins of those others known as the baths of Libya, a large earthen vase filled with mixtures of different colours. This was in the year that the celebrated chamber was opened in the baths of Titus, that caused such a stir throughout civilised Europe, viz., 1813. There were, in the vase referred to, three different shades of red—one of a bright, approaching to orange colour, another a dull red, and the third a purplish red, nearly of the same tint as prussiate of copper. On exposing the bright red to the flame of alcohol it became a darker red, and on increasing the heat by means of the blow pipe it fused into a mass very much like litharge, and which was really demonstrated to be this substance by the action of sulphuric and muriatic acids, proving that it is minium and red oxide of lead. On exposing the dull red to heat, it became black, but on cooling recovered its natural tint. When subjected to heat in a glass tube, it afforded no volatile matter. Acted on by muriatic acid, it rendered it yellow, and the acid when heated upon it yielded an orange-coloured precipitate to ammonia. The colour, when fused with hydrate of potash, rendered it yellow, and the mixture acted upon by nitric acid, afforded silica and orange oxide of iron. It is very evident from these results that the dull red colour was an iron ochre. The purplish red mixture, when subjected to experiments, exhibited very similar phenomena, and proved to be an ochre of a different tint. In his report to the Royal Society, in 1815, on these ancient painting mixtures, Sir Humphrey Davy said: "I found another red in the walls, of a different tint from those in the vase, and much brighter, which had been used in various apartments and formed the basis of the colouring of the niche and other parts of the chamber in which the Laocoon is said to have been found. On scraping a little of this from the wall it was found by chemical tests to be vermilion or cinnabar, and in heating it with iron filings running quicksilver was obtained from it. The above particulars of a matter of the far distant past may prove useful, and those modern decorators who like to know what they are working with, and who are chemically inclined, may possibly pursue the subject still further."

FOURTEENTH CENTURY GOTHIC.

THE fourteenth century was the glorious age of Church Architecture. It was the climax beyond which Christian art was never carried. Though all that riches, piety, and talents could effect was done to sustain its consummate excellence, it followed the universal law, and, having once reached perfection, began gradually to decline. We have some difficulty in forming an accurate idea of the extreme architectural and decora-

tive magnificence which prevailed at this period. It may, however, be fearlessly asserted that not only were the Abbey and the Cathedral of gorgeous beauty and wealth incalculable, but every Parish Church was proportionately adorned. Let us take the Lady Chapel at Ely. Examine any one of its hundred canopied sedilia. Look at the exquisite mouldings and panelings of the projected Purbeck shafts and buttresses below; then admire the minute images, the crisp bunches of hollow foliage, carved like ivory balls with almost microscopic nicety. Lastly, see the thick flakes of gold which overlay them, and the bright varied colouring which may yet be traced under the coats of modern whitewash. Then view the spangled vault, once glowing with stars and golden bosses; the windows, which were filled with the richest stained glass, as their scanty and obliterate fragments still attest. Observe the countless compartments of tracery within tracery, and canopy above canopy, which climb even to the ceiling. The remains of ancient workmanship which have not been hewn away by the axe and the chisel should also be minutely observed. Or imagine Lincoln or Westminster in its glory. There are many parts of these, and indeed of every cathedral, where a single square yard of sculptured detail exhibits the labour of months, while a niche or a canopy or a moulded base must have been the task of many a long toilsome week. The aggregate cost of any one such building would now be almost incredible. Take the first of that long series of high tombs, with its panelings, its canopies, its effigies; the jewelled mitre and ring, the painted orphery, the gilded crocket; look up under the dark canopy, there is gold and colour and intrinsic glistening, though man's eye was never likely to behold it. The pavement was once of coloured tiles or mosaics, in which a hundred latent effigies and crosses shone resplendent. You may still see the marble slabs reft of their metal, the boss faint with its faded gold, the canopy deprived of its silver saint, the window without its ancient hues. Go again to the Village Church. In the time of the Edwards alone, thousands of these were built throughout the land. It is certain, and may be proved by actual examination in numberless instances, that even these, however remote, generally possessed the most exquisite decoration.

THE Sanitary Committee has decided to recommend to the Coventry City Council that additional accommodation for small pox cases be provided on land belonging to the Corporation at Pinley. The total estimated cost is £5,227, exclusive of roads, fencing, heating, architects' commission, clerk of works, and incidental expenses.

THE Admiralty intend to extend and improve Devonport Naval Ordnance Depot to provide accommodation for nearly double the number of men now employed. It is intended to spend on the extension during the next twelve months over £8,000. The existing police quarters are to be altered and extended at a cost of £3,000, and the water supply is to be improved at an expenditure of £3,000.

THE strike of Douglas house painters has collapsed. The men had been out for exactly five weeks. Their demand was that they should be paid at the rate of 7d. per hour from the 1st March to 31st October, and at the rate of 6d. during the rest of the year, instead of at the rate of 6d. per hour the year round. They have now gone in at the old rate, with the exception of a few men who are jobbing on their own account.

EXTENSIVE alterations are to be carried out to the Voluntary Schools at Hasland, to meet the need of additional accommodation. It is hoped to raise the money by subscription.

THE sum of £7,000 has been given by the executors of the late Mrs. Baker, towards the building of the new Bridgnorth and South Shropshire Infirmary.

SOCIETY MEETINGS.

Sheffield Society of Architects and Surveyors.—The annual general meeting of the members of this Society was held at the School of Art, Arundel Street, on Tuesday last, the president, Mr. E. M. Gibbs, F.R.I.B.A., in the chair. There were also present, Mr. C. Hadfield, F.R.I.B.A., Mr. F. Fowler, F.S.I., Mr. C. J. Innocent, F.S.I., F.R.I.B.A., Messrs. Thomas Winder, W. T. Campsall, J. T. Wheen, W. C. Fenton, J. R. Wigfull, A.R.I.B.A., W. J. Hall, J. Smith, E. Winder, jun., J. B. Mitchell-Withers, and many others. The report of the Council was read by the hon. sec., Mr. C. J. Innocent. It referred to the satisfactory condition of the Society, and said that the following members had been advanced from the Student to the Associate Class:—Messrs. Bromley, Campsall, Flockton, Hadfield, Innocent, Lancashire, Sampson, Woffenden, and the following had been received as new members:—Students: Messrs. Appleby, Chippling, Clayton, Dawson, Day, Ensor, Hemsall, Parkin, Robinson, Sandford, Gillham and Skill; Fellow: Mr. Bryden; and two Lay Members, Mr. B. Bagshawe and Mr. W. J. Gardner. Dr. H. C. Sorby had consented to become an honorary member. The report made reference to the work of the session, to alteration made in the rules, and to improvements made in the library. At the invitation of Mr. E. W. Mountford, the students visited the new Town Hall. The classes during the year had been well maintained, and the sketching class had visited numerous places in the neighbourhood. Mr. F. W. Chapman had secured the president's prize, and Mr. Y. C. A. Feather the Society's prize. In the designing class, Mr. Y. C. A. Feather had taken first, and Mr. Y. V. Woffenden the second prize. Mr. Charles Hadfield was elected President for the ensuing year.

Liverpool Geological Society.—The last meeting of the present session of the Liverpool Geological Society was held on the 9th instant, in the Royal Institution, Colquitt street, when the chair was occupied by Mr. T. Millard Reade. Mr. T. W. Davies read a paper entitled, "Description of the Strata exposed during the construction of the Seacombe branch of the Wirral Railway." A number of interesting geological specimens which had been found in the cutting at Seacombe and Poulton were exhibited, and it was stated that several of the specimens were exceedingly rare. The strata exposed was of great scientific interest to geologists.

Edinburgh Architectural Association.

—At the last meeting of this association, which was held in the Royal Institution, Mound, Mr. W. W. Robertson, the president, in the chair, Mr. John Kinross, A.R.S.A., made a communication on St. Andrew's Priory, in which he dealt, in the first instance, with the history of the buildings, and proceeded afterwards to describe in detail the excavations which Lord Bute had undertaken in connection with the ruins. In his opinion the evidence was amply sufficient to prove that the monastic buildings were commenced after the Cathedral building was completed. Mr. Thomas Bonnar read a communication on "Some Notes on the Ancient Mural Decorative Art in Scotland."

Leeds and Yorkshire Architectural Society.

—At the annual meeting of this society the following gentlemen were elected officers for the session 1895-96:—President, E. J. Dodgshun, F.R.I.B.A.; vice-presidents, W. Watson (Wakefield), W. Carby Hall, A.R.I.B.A.; hon. treasurer, William H. Thorp, F.R.I.B.A.; hon. librarian, W. H. Beevers, A.R.I.B.A.; hon. secretary, Francis W. Bedford, A.R.I.B.A.; members of Council, W. S. Braithwaite, H. B. Buckley, G. F. Danby, W. A. Hobson, Jas. Ledingham, F.R.I.B.A. (Bradford), W. C. Williams, F.R.I.B.A. (Halifax); auditors, H. S. Chorley, B.A., L. S. Dodgshun.

WHILE breaking down a mahogany log in a North London saw mill last week, the blade of a razor was found within three inches of the centre. It was broken in three pieces. The size of the log was 24 in. by 24 in.

SIR F. LOCKWOOD ON DRAWING.

ART V. THE CAMERA.

SIR FRANK LOCKWOOD, in opening the annual exhibition of drawings, held by the Royal Society of Great Britain and Ireland, remarked that no phase of the Society's work interested him more than that which promoted drawing from memory, for it was well that such drawings should be encouraged in these days. He had no great admiration for the camera or the kodak, and he looked with the gravest apprehension at the illustrated papers of to-day when he found that they were

A person unaccustomed to that found a little difficulty, but Mr. George Du Maurier had told him that in those days he drew with the greatest confidence upon it. An alteration could easily be made. Reproduction, however, was expensive, because the block had to be cut, but now they had the process system, which was adopted by the illustrated papers, and by which they reproduced with the most wonderful fidelity a drawing which might be made with pen and ink upon a sheet of paper. That should be a great encouragement to those who wished to develop drawing in black and white, for if they spoiled one piece of paper they could easily

named Blackmore, discovered a heap of coins, about a hundred in number, in a good state of preservation, though they are said to be about 1,000 years old. The man gave a quantity to his master and sold the others at prices ranging from 6d. each and upwards.

FROM a revised list it appears that there are now on the books of the Institution of Civil Engineers 6,737 members of all classes; there being seventeen honorary members (including five princes of the blood), 1,862 members, 3,687 associate members, 355 associates, and 816 students.

THE German Chapel Royal attached to Marlborough House is now undergoing extensive alterations, and is to be made similar to the Chapel Royal, St James's. The old pulpit, a heavy thing with a hood, has been removed, the altar rails advanced, and the old seats have been taken away. The organ, which is over the altar, is not at present to be moved.

IN view of the unusually large number of imposing town mansions that are just now in the market, the keen competition that resulted in the sale of the lease of No. 12, Charles-street, Mayfair, the residence of the Marquis of Ailsa, at Tokenhouse yard, has a special significance. The opening bid was 17,000*l.*, and it was not until 24,000*l.* had been offered that the valuable lot was deemed sold.

THE amount of gas annually made in England is 60,000,000,000 cubic feet. To produce this quantity 6,000,000 tons of coal are used.

At a recent meeting of the Council of the Royal Society of Painter-Etchers, the following Associates were elected Fellows of the Society: D. Q. Cameron, J. Finnie, Oliver Hall, J. Knight, R.I., and A. Legros.

A MISSION-ROOM formed out of two cottages, which has been used for eighteen years, in the Lower Easton district of Bristol, is about to be replaced by a new Wesley Hall, on which it is proposed to spend £1,400.

MR. ARTHUR S. COPE, the portrait painter, has been commissioned, by the Emperor of Germany, to paint a full-length portrait of his Majesty for presentation to the Queen. The Emperor is to be painted in his uniform as colonel of the Scots Greys.

THE date of the opening of the new water-works at Malvern, by her Royal Highness the Duchess of Teck, has been altered from the 22nd to Tuesday, the 23rd inst. Their Royal Highnesses will arrive at Madresfield Court on the Saturday.

BUNGALOW COMPETITION: CROSS SECTION BY "VIOLET."

nothing more than a bundle of indifferently-produced instantaneous photographs. He feared that great danger would result from this. Of course, the draughtsman, could not get as near the truth, perhaps, as the camera, but he was thankful to think in the cause of Art that there was always something which the artist could get that was far removed from the power of the camera. No doubt, there was little encouragement for art or art students. He should think it a dull day for a young fellow who walked down Fleet Street with a portfolio of drawings, full, perhaps, of ability and talent, which he took from one illustrated paper to another, only to find that the rival camera forestalled him wherever he went. Illustrated journals had multiplied enormously during the past few years, but, unfortunately, the avenues for the youthful artist had not been multiplied to the same extent, and he wished to take that opportunity of entering his protest as strongly as he could against the art of the country being driven out from amongst them by the camera. Turning to speak of drawing from memory, he should think it an immense advantage to a caricaturist. Nothing he should think would be more offensive to the person who was to be caricatured than to see an artist sitting down before him and exaggerating all those defects which the model would probably hide. But if the caricaturist had the gift of drawing from memory, he could make his drawing under circumstances which would in no way lead to his detection, and he could reproduce with satisfaction, if not to the object at least to the friends of the object, the result of his observation, and that result would give satisfaction to the friends of the object in proportion to the exaggeration of the defects of the person who had been drawn. They had one great black and white artist, Sir John Tenniel, who, for more than forty years, with courage, with pathos, with humour, and with no unkind or ungenerous line in his composition, had drawn our national history, all from memory. He thought that the Society did well in encouraging tastes that were artistic. He remembered the time when black and white work was produced practically in one way only for purposes of illustration. In those days a boxwood block would cost something like 7*s.* 6*d.*, and not everyone who could draw in black and white had 7*s.* 6*d.* in his pocket. Then they had to cover it with Chinese white to draw upon it.

get another, and take it to their publisher directly, without having to trust to the person who cut the block, a person considered sometimes by artists to be somewhat erratic, and they would have the certainty of obtaining the greatest facsimile of their work.

SAWDUST.

FOR the new Court House at Richmond, Surrey, the committee having considered the report of Mr. Edmeston, the consulting architect, have recommended the Council to award the first premium of £21 to the author

BUNGALOW COMPETITION: EAST ELEVATION BY "VIOLET."

of the design marked "Esperantia," and the premium of £10 10*s.* to the author of the design marked "Justice." The author of the design marked "Esperantia" was Mr. N. J. Ancell, the architect of the Town Hall, and "Justice" was Mr. Frank J. Brewer, of Richmond.

THE Devonshire County Council is making extensive alterations at the Asylum at Exminster. While engaged in excavating a workman

It is proposed to enlarge the Sunday school premises in connection with the Heelis-street Wesleyan Chapel, Barnsley, by the erection of new class rooms, at a cost of £300.

TENDERS will shortly be required for the erection of a drinking fountain at Sheffield, which it is proposed to place at the junction of the Sheffield and Doncaster Roads, as a memorial to the late Mr. F. W. T. V. Wentworth. The sum to be expended is £250.

ARCHITECTURAL IRONWORK: CONSTRUCTIVE AND DECORATIVE.

*A Series of Instructive Papers for the
Artist and Worker.*

CHAPTER VII.

GIRDERS—continued.

WE now come to the consideration of cast-iron arch girders, which, with wrought-iron tension bars, are very frequently employed for the support of front or back walls of brick edifices in this country, although they are adopted on a far more general scale in the United States, and they are really a very cheap and effective method of securing wide openings. The casting is made in one piece, with box ends, these latter having grooves and seats to receive the wrought-iron tie-rod. This tie-rod is made from $\frac{1}{2}$ inch to $\frac{3}{4}$ inch shorter than the casting, and has square ends, forming shoulders, so as to fit into the casting. The rod has usually one weld in its length, and the greatest care should be observed that this weld is perfect. The rod is expanded by heat, and then placed in position in the casting, and allowed to contract in cooling, thus tying the two ends of the casting together to form abutments to receive the horizontal thrust of the rod. These members require to be very carefully proportioned and constructed. The girder should have a rise of about 2 feet 6 inches on a length of 25 feet. One square inch of cross section of rod should be allowed for every ten net tons of load imposed upon the span of the arch. It may here be mentioned that a cubic foot of brickwork weighs one hundredweight, and a foot of brickwall, 16 inches in thickness, will weigh 150 pounds. It is sometimes supposed that iron members, whether in the form of pillars or beams, tend to render an edifice fire-proof, or partially so, but this may fairly be set down, as results have demonstrated from fires which have of late years taken place in the Metropolis and elsewhere, as a decided error. Unprotected iron, and especially cast-iron, will easily succumb to intense heat if it is continued for any length of time. Iron columns are generally cast plain, with plain caps and bases. More rarely, they are fluted to give them somewhat of an ornamental character, if exposed to public view, as previously mentioned.

The next division of the subject which comes up for consideration is that of wrought-iron beams and girders, which are often employed instead of cast-iron members, though it must be admitted that they are hardly so satisfactory, everything considered. Architectural members of the description under notice, when made of wrought-iron, are not actually hammered out on the anvil or by the steam hammer, but are in reality constructed of rolled malleable iron-plate of the proper section, secured together by rivetting. In these all calculations of strength will be largely dependent on the rivetting and bolting, and too much care cannot be devoted to these very and all important joints. The following items with regard to rivetted joints are essential to be borne in mind. In many instances these wrought-iron plate girders are secured together by placing angle irons at each corner, and then rivetting through the whole, especially when the girder has a double web. Girders of this description are made of a great variety of forms, of sections and combinations, according to the purposes for which they are required, and the loads which they will have to sustain. Obviously the strength of girders of this kind is largely dependent upon the rivets and rivetting. Wrought-iron girders are designated by a variety of names, according to the principle adopted in their construction, such as "plate," "lattice," "trellis," &c. The following figures give some particulars of a single web girder: Web, 20 inches by $\frac{1}{2}$ inch; top plate or flange, 10 inches by $\frac{3}{4}$ inch; top angles, 4 inches by 4 inches by $\frac{1}{16}$ inch; bottom angles, 3 $\frac{1}{2}$ inches by 3 $\frac{1}{2}$ inches by $\frac{3}{8}$ inch; length of 30 feet, say 2,600 lbs.

In treating now of rivetted joints, it may be mentioned that, according to Mr. Adams, "the nominal diameter of a rivet is the diameter before being heated. The hole is larger to allow of the heated and expanded rivet entering

without difficulty. The hole whether drilled or punched averages $\frac{1}{16}$ inch larger in diameter (at the junction of the plates) than the rivet, and the finished rivet of course fills the hole. The diameter of head averages 1.7 times that of the shank, with a thickness equal to $\frac{3}{4}$ of the shank. The total length of rivet shank to fill the hole and make the closing head is commonly made equal to the total thickness of plates passed through + $\frac{1}{16}$ inch for each joint, or $\frac{1}{32}$ inch for each plate + $1\frac{1}{2}$ times its diameter. For instance, a $\frac{3}{4}$ inch rivet would have a snap head $1\frac{1}{2}$ inches diameter and $\frac{9}{16}$ inch thick, with a rivet hole $\frac{5}{8}$ inch diameter, and passing through three $\frac{1}{2}$ inch plates would have a length from underside of head to point of $2\frac{3}{4}$ inches." On the same subject Professor Unwin states that "the tension in the rivet may be estimated at 21,000 lbs. per square inch of its section, and friction due to this would be about 7,000 lbs. per inch of rivet section." Experiments show a still greater friction, but if the tension in the rivet exceeds the elastic limit, its performance cannot be relied upon. English engineers entirely neglect the friction in estimating the strength of the joint, the reasons assigned being that the amount of tension in the rivet is not ascertainable, and that vibrations and other causes, tending to slightly elongate the rivet, may, in course of time, destroy it altogether.

Coming now to the lap and pitch of rivetted joints, the least should allow of a clear space of metal in each direction equal to the diameter of the rivet. Generally in girder work a joint with $\frac{3}{4}$ inch rivets will have a minimum of 3 inches pitch, with a distance of $1\frac{1}{2}$ inches from the centre of the rivet to the edge of the plate. The tenacity of iron plates is considered to be decreased by from 5 to 20 per cent. by punching, and to be increased by from 10 to 12 per cent. by drilling.

The average tenacity of joints is reckoned in pounds per square inch on net section in iron plates thus: Single rivetted drilled, 40,500; single rivetted punched, 35,400; double rivetted drilled, 43,700; and double rivetted punched, 39,000. The original tenacity of iron plates is 46,000 pounds per square inch. The shearing resistance of iron and steel bars averages $\frac{2}{3}$ ths of their tensile strength, but in the case of rivets the resistance is from various causes apparently less. The average resistance to single shear per square inch of section, is in iron rivets with punched holes, 46,000 pounds, and in iron rivets, with drilled holes, 43,000 pounds, so that a $\frac{3}{4}$ rivet in a punched hole in single shear would have an actual diameter of .8 inch, an area of .5 square inch, and a resistance of 23,000 pounds, which, at a factor of safety of $\frac{1}{4}$ th would give a safe load of 5,750 pounds or 2.567 tons. In speaking of the crushing action in hole, Professor Unwin states that "the value of the crushing stress, which produces injury to the tenacity, or shearing resistance of the joint, is very uncertain. In the case of steel joints there is no indication of injury with crushing pressures of 50 tons per square inch. With the ordinary proportion of rivets, the crushing action will in no case need to be considered in single shear joints, and only in double shear joints when the plates are less than $\frac{7}{8}$ inch thick." On the whole, Professor Unwin is "inclined to believe that the importance of crushing action has been exaggerated."

In our next chapter we shall proceed to treat of iron work as employed in roofs.

(To be continued.)

HAMMERSMITH is to have a Free Library, so the ratepayers have decided by a large majority. The Ecclesiastical Commissioners and the Copyholders of the Manor of Fulham have presented a valuable site, and Mr. Passmore Edwards has offered to provide the building, at his own cost.

AN extension of the Liverpool Library and Museum buildings to Byrom Street is urgently needed in the interest, not only of the Museum, but of the Liverpool School of Science, Technology, and Art. Ample accommodation could be found for the two bodies as well as for a public hall capable of holding 1,500 persons. We understand the Finance Committee is giving the matter careful consideration.

ANOTHER BLOW AT THE BUILDING TRADE.

THE THREATENED STRIKE.

PRESENT indications suggest that the 1st of May will see the opening of another war in the Building Trade, which must cause ruin to many of the smaller builders and misery to many of the 40,000 men employed in the industry in the Metropolis. Some time back there was published a lengthy statement of the position from both sides, Mr. Henshaw, the secretary of the Central Association, for the master builders; and Mr. Verdon, the secretary of the Building Trades' Federation, speaking for the workmen. At the time it looked as if the matters in dispute might be settled; conferences were to be held, and the points of difference did not seem difficult of adjustment. But these hopes have now been destroyed. The first conference on February 18th was certainly amicable and conciliatory in its character, but that of March 11th was just the opposite, and the negotiations were broken off. The employers put forward, in addition to minor proposals for changes in working hours and the system of payment, two main proposals, which we quote:—

"That no workman shall be placed under any disability by reason of being or not being a member of a trade society."

"That no objection shall be raised to sub-letting work, provided these rules are observed."

The Union reply to the first proposal is that the men are willing to work with non-union men as a whole; but that they claim the right to refuse to work with any of those who have acted for the Free Labour Associations or independently against other workmen when there has been a dispute. The Union holds that even if the agreement was made it would be impossible to compel individuals to keep to it, and that in any case the presence of non-union men on the works would lead to friction and quarrelling. As to the other new rule, the workmen refuse to have any hand in an agreement which acknowledges the principle it embodies. They urge that it has been recognised as wrong by the County Council, the School Board, by Government departments, and by local governing bodies, and they point out that if they enter into an agreement sanctioning the re-introduction of the system, they cannot ask these bodies to fight against it. It is further urged that a result of the system would be that the men would again have to scamp the work and rob the public. Another contention is that sub-letting of contracts would allow the employer to evade his responsibility under the Employers' Liability Act and place it upon the shoulders of the sub-contractors.

While declining to agree to this proposal, the representatives of the workmen at the conference on 11th March suggested the formation of a conciliation board composed of equal numbers of masters and men. This was, it is declared, rejected by the chairman of the Master Builders' Association, Mr. Stanley Bird, who said: "I do not see the slightest hope for a conciliation board, because you may take it for granted at once that the builders will not submit." He further declared that unless the conditions suggested by the employers were accepted, there would no longer be any recognised rules of working. Here the matter stands and, as we have said, there does not appear to be hope of settlement.

No decision has yet been arrived at with regard to the new Infirmary which it is intended to erect in connection with the Wakefield Workhouse. Mr. Herbert Beaumont, the clerk to the Board of Guardians, has applied to Mr. Watson, the architect, for details as to the cost of the proposed building, which altogether will amount to £24,500, and the matter has been referred back to the committee.

A NEW clock striking the hours on a large bell, with two external dials and hands, from the designs of the architect, Mr. Robert John Smith, of Albion Street, Leeds, has been fixed in the tower of the parish Church of Woodlesford, near Leeds, by Messrs. William Potts and Sons, clock manufacturers, of Leeds and Newcastle-on-Tyne.

Trade and Commerce.

We shall be glad to receive copies of catalogues from firms engaged in the allied building trades. These will be carefully looked through, any novelty noted, and—should its nature seem to demand it—fuller attention drawn thereto. We are particularly wishful to secure the friendly interest of designers and artificers in THE BUILDERS' JOURNAL, and, now and then, we might see our way to reproduce an outline sketch or illustration of any contrivance that struck us as being new or needed. Building covers up—figuratively, and in fact—so much ground, and we mean to cover the whole of it.

We should be further obliged if firms would indicate, by some suitable mark, the pages in their catalogues to which they would, in particular, desire to call our attention.

E. Farrar & Co.—This Company's Sloping Cill (Regd. No. 225,725), consists of an improvement in the formation of the cill of their casements of the "Climax" and "Eclipse" section, whereby any moisture gathered in the cill is readily passed away. The slope being towards the outside naturally prevents water from resting in the section, and consequently from running over inside the room. The holes drilled along the lower edge of the slope pass the water

to the outside. The sketch also shows the "Condensation Lip," which collects what moisture runs from the inside of the window and passes it down the slope of the cill to the outside. Messrs. E. F. & Co. are fitting this cill to all their best work, and the casements for the Hampshire County Council Buildings, Winchester, and several mansions, both in England and Ireland, which have been fitted in this way, have given great satisfaction.

Douglas, Isle of Man.—The details of the information from Douglas that the strike of the house painters has collapsed, is of very little importance beyond the one fact that the workmen have, after a senseless strike lasting five weeks, gone back to their work at the old rate of wage. When will these misguided work-people learn wisdom?

Manchester Improvements.—One of the inspectors of the Local Government Board has held a series of inquiries into applications of the Manchester City Council to borrow sums amounting in the aggregate to more than £260,000. Of this £100,000. was for the extension of the electric-light system in the city, £100,000. for works of sewerage and sewage disposal, £50,000. (in excess of present borrowing powers) for the building of the technical school, and £10,000. for the replacing of defective drains in the poorer parts of the city.

Drainage of the Law Courts.—The drainage of the eastern block of the Royal Courts of Justice is now being entirely reconstructed and replaced, and will take some months to finish. With the completion of this part of the building the whole of the drainage of the Law Courts will have undergone a thorough overhaul, and when finished all the latest sanitary appliances will have been provided for the various lavatories, &c. More direct access to the waiting rooms for witnesses and others will shortly be

provided by the construction of doors leading straight from the court corridor to these rooms. The first one to be opened out will be between Queen's Bench Court 9 and Probate Court 1, and will be cut through the stone wall of the court corridor.

The "Lewis Link" for Lightning Rods.

This coupling for connecting the upper terminal round rod to the flat copper tape of a lightning conductor, is the only device for its purpose which is constructed in a single piece, giving a great advantage over all other couplings, and affording a larger area of surfaces of coupling and copper tape in actual contact, which the wedge-shaped socket into which the copper tape is fixed causes to be permanent. The simplicity of its construction is best seen referring to the illustrations. Fig. 1 is a side view of the "Lewis

position, and the screwed portion

of the round upper terminal rod partly screwed through its socket; it would have been better to show this rod screwed right down upon the copper tape, where it would be when in position. Fig. 2 is a sectional view of the coupling, and plainly shows how the copper tape is permanently secured as a wedge in the coupling. Once in position it is simply impossible for the connection, thus simply made, to be broken. It was first exhibited in the Electrical Exhibition of 1892, held in the Crystal Palace, and was there considered worthy of an award by the scientific judges of matters electrical. It is, indeed, the only improvement in lightning conductors for some years, and, although small in size, is of real and obvious importance.

A MEMORIAL CHURCH AT LLANDUDNO.

THE Memorial Stone of the Duke of Clarence Memorial Church, at Llandudno, was laid on Wednesday afternoon by the Duchess of Teck, who was accompanied by the Duke of Teck. Their Royal Highnesses were received by the Bishop of St. Asaph in full canonicals. At the close of the ceremony thirty-six purses, containing donations, were laid on the stone by lady donors. The new Memorial Church is being built on an excellent site given by Lord Mostyn, in East Llandudno, and forms part of the parish of Eglwysrhos (S. Mary's). It is to be built on the cruciform plan and will consist of Nave (the portion already built) 94 feet long by 25 feet wide, with an accommodation for 450 people, with N. and S. Arcades, the Entrances being towards the N. and S. A noble Chancel 37 feet long and 25 feet wide with a Side Aisle or Chancel on side, and Vestries and O. Chambers on the other. The completed Church is calculated to seat 950 persons, and will cost about £10,000. The Architect is Mr. J. Oldrid Scott. In the general lines and in its proportion, the Church will follow the very successful Church at Rhyl, by the late Sir G. Scott, but will differ in detail as well as in the proportion and design of the tower and spire. This will stand at the S.W. angle of the Nave and will form a very conspicuous object, both from the Esplanade and from Mostyn Street. The Church is being built of a very beautiful limestone, with dressings of Bromsgrove stone, the interior facing being of Bath stone Ashlar, with dressings of Bromsgrove stone having occasional bands of its red variety. One feature of the interior is the use of the fine fossil marble from Frosterly (Northumberland) for all the main columns. The Nave benches are of oak and of substantial character. The side arches of Nave are temporarily built up, and having the future Aisle windows built in.

Correspondence.

THE Royal Society of Artists, Birmingham, has organised an especially interesting exhibition of pictures and sketches by George J. Pinwell and George Mason, and by two or three artists of similar belief. Of Pinwell there are eighty-five examples, of Mason forty, three of A. Boyd Houghton, two of Fred Walker, and of Messrs. Charles Green and J. W. North two and ten respectively. The catalogue of the exhibition is a sumptuous publication, prefaced by three short essays, "A Group of Idyllists," "George Pinwell and his Art," and "The Character of George Mason's Painting," by Mr. Harry Quilter, and illustrated by sixteen woodcuts from drawings by G. J. Pinwell and Mr. J. W. North.

The Builders' Journal COMPETITIONS.

RULES.

- 1.—There must not be more than three separate sheets of drawings submitted by any competitor in any single competition.
- 2.—The scale must be a uniform one of 8 feet to the inch for plans, elevations, and sections. Detail drawings must be to half-inch scale, and a perspective in ink may be included.
- 3.—All drawings must be inked in, and be without colour or wash.
- 4.—Drawings in each competition must be sent in on the date specified, and must be submitted under a motto, accompanied by the name and address of each competitor in a sealed envelope.
- 5.—All competitors must be under the age of twenty-six.
- 6.—A public exhibition of the premiated designs will be held. The result of each monthly award will be announced in our columns and the assessors' reports will be published in full. The Drawings will remain the property of their authors, but we shall reserve the right to reproduce any we think fit.

THE AWARDS.

- 1.—A Gold Medal and a Cheque for £10 10s., to the competitor who submits the best half-dozen sets of drawings during the session of twelve months.
- 2.—A Silver Medal and a Cheque for £3 3s., to the competitor who submits the best single set of drawings during the session.
- 3.—Certificates signed by the Assessor and countersigned by THE BUILDERS' JOURNAL, will be awarded to the authors of the premiated designs in each competition, who will each receive a cheque for half-a-guinea for out of pocket expenses.
- 4.—At the end of the session the whole of the premiated designs will be submitted to a committee composed of the monthly assessors, and the Gold and Silver Medals and cheques will be awarded by them.

THE SECOND COMPETITION.

A Village Club House.

The Proprietors of the BUILDERS' JOURNAL invite drawings, in competition, from those under twenty-six years of age, for a Village Club House, on a corner site, 150 feet by 40 feet. The Club to contain a general room with a dais for the villagers, a reading room and library, a bowling alley, service bar, tea room, committee room, housekeeper's apartments, and three cubicles for public use. The necessary outbuildings must be provided. Cost not to exceed £2,000. Drawings to be delivered at Talbot House, Arundel Street, Strand, not later than Monday, the 6th May, 1895.

ANNOUNCEMENTS.

SAWDUST.

A NEW Gasholder is to be erected by the District Council at the Spalding Gasworks, the estimated cost being £2,500.

THE Committee of the Blackpool Corporation charged with the work of selection has decided to adopt the design for a new Town Hall submitted by Messrs. Woodhouse & Potts, of Bolton, awarding the second premium to Mr. A. Gilbertson, Liverpool, and the third to Mr. J. Lovell, London. The estimated cost of the building is £8,000, and the site selected is the land at present occupied by the disused Town Hall and adjoining buildings. An immediate start is to be made with the work.

APPLICATION is to be made by the Town Council for sanction to borrow £6,000 for the erection of new Baths at Tunbridge Wells.

ON the new Chronic Blocks at Menston Asylum, Yorkshire, £57,000 has, so far, been expended.

IT is proposed to build a New Church at Bretherton, near Croston, to seat 300 persons, at a cost of about £1,100. Mr. Andrews, of Preston, is the architect.

MESSRS. T. H. & F. HEALEY, Architects, of Bradford, Yorkshire, have prepared plans for the re-building of Farsley Parish Church Tower. The Tower is to be similar to the original structure, but so arranged as to admit of a peal of bells at a future time. Tenders have been accepted, and the work is to proceed at once.

THE Town Council of Nottingham purpose borrowing the sum of £73,000 for the purposes of sewerage and sewage disposal, £2,000 for laying out a building estate, £1,300 for the purchase of two steam fire-engines, £775 for street improvement, and £350 for the improvement of the Sneinton Baths.

THE Coseley District Council has decided that alterations and additions be made to the Council buildings, so that a new Council Chamber and offices for the Council officials be provided, at a cost of £409 15s. 8d.

THE contract for the construction of the new rifle butts at Gravesend for the Lee-Mitford range has been placed by the War Department with Messrs. B. Cooke & Co., Phoenix Wharf, Church road, Battersea.

A MAIN sewer is about to be constructed under the Seine, just above the Pont de la Concorde, for the conveyance of most of the sewage of the south of Paris. It will be 10 feet below the bed of the river, and will, it is believed, be completed by next spring.

THE plans sent in by Messrs. Marshall & Dick, Architects, Newcastle and North Shields, in the competition for new schools in Coach lane, North Shields, have been placed first in the order of merit by the assessor, Mr. E. R. Robson, F.S.A., London. The schools will provide accommodation for 1,350 children, at an estimated cost of about £15,000.

At the meeting of the Dewsbury Town Council, on Tuesday last, the recommendation of the Sanitary and Farm Committee for the erection of a refuse destructor on the site of the Old Anchor Mill, Webster Hill, was adopted. It was agreed that the new baths and library be fitted throughout for electric lighting, and that two new lodges be erected at the Park, one in Cemetery Road and the other in Boothroyd Lane.

MR. HENRY HARBEN, of Hampstead, who has taken the greatest interest in the North-west London Convalescent Homes Fund for working men, has decided to erect at his own expense a building at Littlehampton, to cost £20,000. The home will contain reading-rooms, &c., and all the latest improvements, and be lighted throughout by electricity. The work will be put in hand forthwith.

It is announced that Sir Frederic Leighton, Bart., P.R.A., will be absent from the Royal Academy banquet this year. The President was advised by Sir W. Broadbent that he must at once leave England on a prolonged holiday, and he started on Thursday therefore for Gibraltar, his first resting place. Sir John Millais, Bart., R.A., will fill the vacant chair at the banquet in May.

THE Cheshire County Council purpose borrowing £80,000 for enlarging the Upton Lunatic Asylum.

A WEALTHY Greek of Alexandria has offered half a million drachmas for the restoration of the ancient stadium or racecourse, so that it may be used for the Olympic games to be held at Athens next year.

A wonderful ivory mat is to be exhibited at Earl's Court. It is one of the only three in the World, and was made in a small hill State in the North of India. The Rajah to whom it belongs laid out a big fortune, a matter of hundreds of thousands, it is said, upon this treasure.

PLANS have been prepared by Mr. W. S. Morley, F.R.I.B.A., of Bradford, for a new Wesleyan Church and Schools at Bramthorpe.

PLANS have been prepared by Messrs. Heaton and Ralph, of Wigan, for a new School to be erected at Standish Lower Ground, Wigan. Tenders are being advertised for.

IT is proposed to extend the Asylum at Coxlodge, Gosforth, Northumberland. Plans are by Mr. J. W. Dyson, of Newcastle-on-Tyne.

THE Sedburgh School, York, which was founded in 1551 and ranks as one of the great public Schools, is about to have a new School Chapel added to it. The portion to be built first will comprise a part of the Nave and Aisles, Chancel and Vestry and Organ Chamber, with temporary Porch, leaving the west end of Nave and South Transept for future extension. The work has been let to Messrs. Brassington Bros. and Corney, of Settle, for £4,098 (including stone lining), and the cost will be defrayed by a sum raised by the masters of the School. The plans have been prepared by Messrs. Paley, Austin & Paley, architects, of Lancaster.

THE workmen have commenced clearing the ground for the purpose of laying the foundation for St. Alban's Church, Burnley. The contract for this part of the work has been let to Messrs. Smith Brothers, Burnley, but that in respect to the superstructure has not yet been decided.

PLANS have been prepared by Mr. W. C. Hardisty, of Manchester, for the new Christ Church, Moss Side, Manchester. The work is to be begun early next year if half the sum required can be guaranteed by the efforts now being made.

THE foundation stone of a new Board School has been laid at Starbeck for mixed and infants. Each department is to have a Central Hall with surrounding Class Rooms, separated by glazed screens and doors, and each Class Room accommodating 60 children. The buildings will be in the Tudor style, and of Pateley stone, with ashlar dressings. The cost of the building itself will be £6,000, which, includes the Master's and Caretaker's Houses, and with the land and furnishing, will reach £10,000. Messrs. H. & E. Marten, of Harrogate and Bradford, are the architects.

BOARD Schools are to be built in Raynham Road, Upper Edmonton. Mr. P. B. Freeman, of Staple-inn, Holborn, is the architect, and the tender of Mr. C. G. Hill, of Coventry, has been accepted for the execution of the work at £17,720.

THE tender of Messrs. Hill & Smith, Dudley, at £800, has been accepted for fencing St. Paul's Churchyard, Birmingham, which is to be laid out as a garden and recreation ground. The work will be proceeded with at once.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the work.

SMOKEY CHIMNEYS & DEFECTIVE VENTILATION.

Chimney Top.

THE
"DULCE DOMUM"
CHIMNEY TOPS & VENTILATORS
(Downes' Patent).

The only Chimney Top which can be Easily Swept with the Ordinary Apparatus without being damaged. A Positive Preventative of Down-Draught, so Constructed that it Creates a Continuous and Powerful Up-Draught. Simple in Construction having No Movable Parts, Nothing to Oil or Repair. Cannot Get Out of Order. Strongly Made in Galvanised Iron. Once Fixed will Last for Years. Applicable also for Ventilating Public Buildings, &c.

Soil Pipe Ventilator

Builders, &c., testimonials can be seen and prices obtained at the Patentee's Offices—

11, THE PARADE, Lewisham High Rd., New Cross, LONDON, S.E.

ESTABLISHED 1866.

BETHNAL GREEN SLATE WORKS,

Bethnal Green, London, E.

CONTRACTS OPEN.

TO BUILDERS.

The Managers of the Metropolitan Asylums Board hereby invite TENDERS for the ERECTION OF STAFF QUARTERS at the South Wharf, Rotherhithe-street, Rotherhithe, S.E.

Copies of the bills of quantities and form of tender may be obtained, and the conditions of contract inspected at the Board's Offices, between the hours of Ten and Four, upon depositing the sum of £10 (in gold or Bank of England Notes), which will be returned to the depositor if he sends in a bona fide tender accompanied by bills of quantities in accordance with the terms of this advertisement.

The drawings and specification can be inspected at the Offices of the Architect, Mr. T. W. Aldwinckle, 1, Victoria street, Westminster.

Tenders, sealed and endorsed, "Tender for Staff Quarters, South Wharf," are to be delivered at the Board's Offices, not later than Twelve o'clock noon on SATURDAY, the 20th inst.

Tenders must be accompanied by the bills of quantities in a separate sealed envelope with the tenderer's name outside.

The Managers do not bind themselves to accept the lowest or any tender.

T. DUNCOMBE MANN,
Clerk to the Board.

Offices of the Board, Norfolk House, Norfolk street, Strand, W.C.

April 3rd, 1895.

TO BUILDERS AND OTHERS.

The Streets Committee of the Commissioners of Sewers of the City of London will meet in the Guildhall of the said City on TUESDAY, the 30th day of APRIL, 1895, at TWO o'clock precisely, to receive TENDERS for the CONSTRUCTION OF UNDERGROUND CONVENIENCES in Circus-place, Finsbury-circus, and in Cannon-street at its junction with Queen Victoria-street, according to plans and specifications to be seen at the Office of the Engineer to the Commissioners, in the Guildhall.

Tenders are to be on the forms supplied at the said Office, to be sealed, endorsed "Tender for Underground Conveniences at Circus-place" (or Cannon-street, as the case may be), be addressed to the undersigned, and delivered before TWO o'clock on the said day.

Persons sending in proposals must attend personally, or by a duly authorised agent, at TWO o'clock on the said day.

Security will be required for the due performance of the contracts.

The Commissioners do not pledge themselves to accept the lowest or any Tender.

Sewers Office, H. MONTAGUE BATES,
Guildhall, March, 1895. Principal Clerk.

TO BUILDERS.

The Commissioners of H.M. Works and Public Buildings are prepared to receive TENDERS for the ERECTION of a NEW POST OFFICE at Tunbridge Wells.

Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster.

Bills of quantities have been prepared for the use of the builders by Messrs. Lee and Sons, of 35, Craven-street, Strand, and, together with forms of tender, may be obtained at H.M. Office of Works, 12, Whitehall-place, S.W., on payment of One Guinea. The sums so paid will be returned to those persons who send in tenders in conformity with the conditions specified below.

The Commissioners do not hold themselves responsible for the accuracy of the quantities, nor do they bind themselves to accept the lowest or any tender.

Tenders are to be delivered before Twelve o'clock noon, on FRIDAY, the 26th day of April, addressed to the Secretary, H.M. Office of Works, &c., 12, Whitehall-place, London, S.W., and endorsed "Tender for Tunbridge Wells New Post Office."

H. W. PRIMROSE,
H.M. Office of Works, &c. Secretary.
April 3, 1895.

TO BUILDERS.

TENDERS are invited for the ERECTION OF SEVEN SHOPS and DWELLING-HOUSES on the Gordon House Estate, at corner of Chiswick High-road and Chiswick-lane.

Plans and specification can be seen at our offices on and after Wednesday, April 17th; and tenders endorsed "Shops, Chiswick," will be opened on WEDNESDAY, May 1st, at Twelve o'clock precisely.

The lowest or any tender not necessarily accepted.—Messrs. F. and W. STOCKER, Surveyors, 90 and 91, Queen-street, Cheapside, E.C.

Decorating Railway Stations.

Decorating Railway Stations.

THERE is a flutter in the daily papers because a Railway Station is going in for the beautiful. The attack is quite mild — only a few fine photographs at Paddington—but more than one enthusiastic writer has dared to hope that Art and Architecture may yet find Waiting Room accommodation at our great termini. We are not carried away by a photographic screen, excellent though the idea be. Awaiting departure, a decent picture helps to while away the time. So, too, does Somebody's Soap and Other People's Mustard. There is no lack of colour decoration—of a sort. Unfortunately, there are no half-tones; the pigments are elemental. But it is interesting to consider what has been done by Railway Companies architecturally. The Midland Railway have given us St. Pancras, an excellent specimen, in its way, and the South-Eastern, in a moment of unaccountable generosity, reproduced for us the Mediæval Cross that stood in the village of Charing. Then there is the Doric archway at Euston, which rather frowns down on the timorous traveller. But as for Liverpool Street, King's Cross, Waterloo and Victoria—could even Railway Companies surpass these in dreariness and dinginess? In the provinces, Lime Street Station, Liverpool, and the Park Hotel and Station, Preston, both on the North-Western, are, perhaps, as good specimens as may be found, the former with its fine facade, and the latter with its hotel reminding one of a French chateau. But there is plenty of room in London and in the Country for the bestowal of more attention on the graphic and plastic Arts by our railway companies, and internally, even in stations of some structural sense of proportion, is a field for artistic effort absolutely untouched. Abroad something has already been done

A COTTAGE

in this regard. A railway station at Milan has several mural frescoes allegorically typifying Rome and Venice. What a comparatively poor and unremunerative company can do should be easily excelled by our opulent railway organisations. The Entrance Hall and the Waiting Room might, at least, be made pleasing and picturesque to the eye, instead of the insufferable draughtiness of the one and the unsupportable dinginess of the other. As a matter of fact, the average Waiting Room, with its scroll of warnings for the day, and its inquisitiveness as to your spiritual welfare, is the sublimest piece of grotesque that railway companies have ever perpetrated. On the other hand, the subjects for decorative painting and sculpture at rail-

traffic is in correspondence with Continental lines might exhibit views of foreign lands. The experiment of making our railway stations internally artistic should be attempted, and this essay at Paddington may be the forerunner of better things in the days when the pencil again claims somewhat of its own from the ubiquitous camera.

The discovery by Professor Petrie of the remains of an hitherto unknown race in Upper Egypt comes as a surprise to Archaeologists and Egyptologists. The "find" may well be described as the climax of the Professor's patient and persistent research. It is true that the explora-

tions at Naukratis and Daphnæ, and the unearthing of the earliest known Temple at Medum, had already added vastly to our knowledge. Moreover, we³ are indebted to Professor Petrie for fragments from the works of Plato and Euripides. But the recent discovery of two thousand tombs containing evidence on one of the early alien races in Upper Egypt, seems to mock, Sphinx-like, at our Museums and Collectors. Here is a field that no other has touched, and our archæological pride is humbled. Near Thebes, Prof. Petrie has found a town mentioned by Juvenal, and near by was another town, "in which not one single object was

found which was known in any other Egyptian town." Again, three or four miles away, another town! The approximate age of the two thousand tombs examined, was determined by the fact that many of them were dug in the passages leading to Egyptian tombs of the Fourth Dynasty. Therefore, the newly-discovered race upon the plains of Thebes must have been buried three thousand years before the birth of Christ. They had nothing in common with the Egyptians; their mode of burial, for instance, being devoid of embalming. The body was simply put down in a crouching position, the head being severed and the marrow extracted

A COTTAGE AT STAPLEFIELD: FRANK T. BAGGALLAY, ARCHITECT.

from arm and thigh bones—a gruesome ritual. Rather remarkably, seeing this race was far behind the Egyptian in intelligence, they were by no means ungraceful workers in clay. Unacquainted with the potter's wheel, they yet managed to turn out some highly finished hand-made pottery. The Professor's theories as to the origin of the new race are interesting. They could not have come from the north, since they would then have been influenced by Egyptian culture, nor from the south, since they were not negroes. They must, therefore, have come from the east or the west, and, adopting the second alternative, they were probably one of two branches of the Libyan race inhabiting North Africa which migrated eastwards about the sixth dynasty, the one towards Syria and the other towards Upper Egypt. The evidence of the pottery and the carved figures found in the tombs appears to lend some countenance to this theory.

Flat Law SCARCELY a week passes without the public being disturbed again. by the in-dwellers of Flats. The in-dwellers themselves are also disturbed—by the overhead piano and other criminal accessories. There may be one Law for the rich and another for the poor, but there would appear to be neither Law, Order, nor Justice in Flats. Every Flat knocks his neighbour a little flatter. The "case" of General Graham, who occupies rooms in Buckingham Palace Mansions, is particularly instructive in showing how utterly powerless the Law is to deal with nuisances of noise and other character, where a small colony of people are content to be sheltered by the one and identical roof, however high. The General applied to Mr. Shiel, at Westminster, for advice as to whether anything could be done to stop "strumming" on the piano, which a lady, who had recently taken the flat above, persisted in nearly the whole day long. He had a daughter who was very ill, and the noise from the instrument prevented her getting rest. He had a doctor's certificate that the piano tended to aggravate her condition. A written remonstrance from applicant, followed by one from his solicitor, had no beneficial effect. The case was too serious to be lightly regarded, but the magistrate's inability to suggest a legal remedy was the drollest piece of unconscious humour. The best thing to do was to induce the lady to cease playing! Exactly. But then any Board School boy would have known that. The diagnosis of disease is nothing unless you can clap on a remedy. In this case there was simply the disease—of piano playing. It is a disease most prevalent in "upper parts," "semi-detached," and it attains its virulence in "flats." Mr. Shiel and the Law could only fall back upon "decent feeling" as the remedy. We have rather lost faith in "decent feeling." For one thing, it does not always seem to exist. General Graham found no redress, and his case once again demonstrates that the Flat system wants thoroughly re-adjusting. Nothing but an enforced agreement, to be signed by all the tenants, undertaking not to annoy their neighbours, will meet the difficulty, and even then what quibbling there will be over the word annoyance! The builders of flats had better make their floors sound-proof.

Sir George Scharf. THE death of Sir George Scharf, Director of the National Portrait Gallery, did not come as a surprise to his friends. We were aware that his condition was grave several weeks ago. Sir George was the son of a Bavarian artist who settled in London early in the century. He was born in December, 1820, educated at the University School, and

having developed artistic inclinations under the tuition of his father, he was admitted a student of the Royal Academy in 1838. A series of etchings by him, illustrating Macready's Shakespearean revivals, was published in the same year. In 1840 Mr. Scharf travelled in Italy, and accompanied Sir C. Fellow in a journey through Asia Minor, to which country he returned in 1843 as draughtsman to a Government expedition. A large collection of his drawings is deposited in the British Museum. On coming back to England, although he exhibited a few oil pictures, his talents were chiefly devoted to book illustration. Mr. Scharf maintained many of the characteristics of the Flaxman School. In 1857, he was appointed Art Secretary of the Manchester Art Treasures Exhibition. At the close of that Exhibition, he became Secretary and Keeper of the National Portrait Gallery, an office which he held for 25 years, when he was constituted Director of the institution, which is mainly indebted for its success to his untiring energy and industry.

THE INSTITUTE AND THE A. A.

II.

ONE of the first reforms—if it be deemed a reform—necessary in the administration of the Institute, is in the length of its Presidency. If the attributes of Presidency be carefully detailed: the architectural faculty in its highest flight; social position; the power of creating and retaining respect; personal bearing; the unflinching and unbending determination of a strong-minded man—then it must be admitted there are not more than a dozen men in practice qualified to fill the Presidential chair of the Institute. No institution, formed for the advancement of any of the fine Arts, should be influenced by the popping in and the popping out of yearly Presidents. Be the man ever so strong and self assertive, it is quite impossible for him to make any beneficial impression in so short a period as twelve months; and one has only to discover the lesson taught by every kindred fine art society to see that Architecture stands almost alone in attempting it. The system now in vogue, and, if we know anything of human nature—especially the human nature of English architects—likely to be in vogue until a perfect revolution of architectural things happens, lends itself to an enormous amount of vexation of spirit and corrupt practice. The ballot box is the curse of everything it appertains to; its rattle is the knell of parting peace, awakening all the petty jealousies which slumber but lightly under an irritating cloak of indifference and respectability. Can we look down the list of presidents for the past five and twenty years and discover half-a-dozen men who were really fitted to represent the Architectural Art of England? And what of the rest?

If the Council of the Institute is human enough to imagine, or frail enough to discover, that a body of professional men must depend upon mutual admiration for its success, then things must be in a very poor way. For our part, we think it entirely wrong in either of such conclusions. It is the weakness of the administration that frightens so many good men. It is the numerous personal motives floating about the business of the Institute that sickens so many "outsiders." The Institute is like a big jelly fish possessing a certain amount of fascination for young people, without a backbone to satisfy their elders. Grey-haired as it is in its respectability of years, its grandchildren do not hesitate to discuss its general health, to ridicule it, even to throw stones at it. Its authority and dignity are so evanescent that a number of its children run

away and make up a game of their own, and are allowed to continue in their shocking behaviour instead of being thrashed for their impertinence and (professionally) whipped off the face of the earth. Whilst the majority, men within and without the portals of the Institute, treat most of these things with sublime indifference, we have for many years watched most carefully the progress of events. We have discovered much; not, however, a single benefit to architecture emanating officially from the Royal Institute of British Architects. Its existence has never inspired a single man to higher aims; its dignity has never deterred a single unsuitable man from "becoming" an architect. Of deeds it has no record, of influence it is dumb, and so it devotes its energies to examining the young, and passing vapid obituary condolences on the old. That being the present condition of affairs, it looks a difficult task to bring the Institute up to the proper level of its usefulness and importance. Who is to perform the task we do not know. We candidly confess we could not name a man. Did George Edmund Street but live, and in the prime of life, he might have grasped the true position and have been the one man to have started the movement. These movements want but a very little primary force to put the natural laws of change into motion. It is but the first plunge; if some one would but start, all would soon be tumbling into the Waters of Lethe, and emerging freed from the infirmities that flesh is heir to. Where is the architectural equivalent of the President of the Royal Academy? If such a man exists let him be found, for a glorious opportunity awaits him. Granted a longer lease of Presidential life, he could gather round him the flower of English practice—Norman Shaw, Champneys, Pearson, Jackson, Waterhouse, Aitchison, Belcher, George, and others. They would come in for their own self-respect could no longer permit them to remain outside. And then the noble band of "youngsters, coming on,"—Reginald Blomfield, Douglas Caröe, Arthur Street, Waterhouse, jun., Halsey Ricardo, and dozens more we cannot stay to mention, would bring pure architectural blood into the mass of infirmity passing as the Architecture of a civilised age. Fellowship could then die down to a normal number of one hundred—the Elect; and death alone should be the cause of repletion. Associateship could be what it is now, except that a candidate should come with *proof* of his reputation in his own right hand, instead of presenting himself, stuffed like a Michaelmas goose, for examination.

(To be continued.)

BUILDING TOOLS IN ANCIENT EGYPT.

THE brickmakers used moulds, probably of wood, for making the bricks, stamps to impress on them the requisite names or inscriptions, vases for the water to mix with the clay, and yoke across the shoulders to carry them to their destination, and plumb-lines to keep the walls perpendicular. In the time of the eighteenth and nineteenth dynasties foreign captives under Egyptian superintendence were employed. The plasterer used a kind of adze and spatulæ for laying the plaster on walls of clay mixed with straw, smoothers to flatten the surface, coarse brushes of palm fibres, and paint pots to whitewash and colour it. Wooden objects first had a piece of cloth or linen glued on them, and the plaster was afterwards laid upon it and smoothed over.

ADDITIONAL accommodation for cattle from America is about to be provided by the Mersey Dock and Harbour Board, at the Wallasey Section of the Birkenhead Receiving Wharf, the expenditure involved being upwards of £30,000.

A NEW ARCHITECTURAL FEATURE OF LONDON.

THE OFFICE FOR THE PRESERVATION OF RECORDS.

THE old Record Office, containing the national archives, had long ago outgrown the accommodation provided in the Tudoresque building lying between Fetter Lane and Chancery Lane, erected in 1856. Prior to that date the records of public affairs were distributed over no fewer than sixty places, and were as inaccessible to the searcher as they were widely scattered. When at last they were brought together under one roof in the present building on the Rolls estate, which was erected from the designs of Sir J. Pennethorne they formed a collection of great size and importance. They had no equal, declared Sir Francis Palgrave, in the civilised World in antiquity, continuity, variety, extent, and amplitude of facts—containing, in fact, full materials for the history of the country, civil, religious, political, social, moral, or material, from the date of the commencement of the Domesday Book to the present day. But the building, which at the time it was believed would hold all the records that would accrue for fifty years at the least, soon grew too small. In twelve years it had to be enlarged. In forty years it has had to be supplemented by the new building in Chancery Lane, which, within the last few days, has been opened up to view. The building now in use was a substantial, though not handsome, structure, partaking too much of the unrelieved German type; the new building will rank as one of the architectural features of London. In course of time it will be followed by another block, which will necessitate the demolition of Rolls House, connecting the new building with the old; and a further block will be built on the vacant site in Fetter Lane, which is now an eyesore to the neighbourhood. There will then be a complete quadrangle of buildings, forming a Record Office in every way worthy of the multifarious and varied collections of papers, books, and documents deposited within them. The completion of this scheme will take many years. At present the Office of Works is only concerned with the Chancery Lane block. Now that the hoarding is removed, the facade is visible, and will be generally admired. It is at present a mere shell. Inside all is a chaos of ladders and building material. The exterior, however, leaves little to be desired. There is a handsome Gothic doorway flanked by two square towers, and two large windows above. At the extreme corners are hexagonal towers, and all the towers have stone turrets. Altogether the building covers a site 225 feet long and 65 feet wide; and the whole of the work reflects credit upon Mr. Taylor, Surveyor of Her Majesty's Work and Public Buildings in London.

In arranging for the extension of the Record Office, Mr. Taylor was handicapped by the fact that the present office, designed by Sir J. Pennethorne, was designed to face a thoroughfare that was never completed. At that time a project was on foot—indeed was practically decided upon—to construct a new arterial thoroughfare from Piccadilly Circus cutting through Long Acre, and, absorbing Carey Street, leading into the heart of the City, the design being to relieve the Strand, on the one hand, and Holborn and Oxford Street on the other. But the only bit of the road ever made—unless Coventry Street is included—is that which fronts the present Record Office. This accounts for the curious situation of the building, which seems to have been dropped down hurriedly in a builder's yard and forgotten. The scheme was one that could not be revived, for in the meantime the new Bankruptcy Court had been erected directly on the line of route. The scheme, therefore, by which with successive blocks of buildings a perfect quadrangle will ultimately be formed, was decided upon. This sealed the fate of Rolls House, a very unpre-

tentious structure, which has been used as an adjunct of the Record Office, mainly being used by Mr. Lyte, the deputy-keeper, and his assistants. This will come down before the next block is commenced, the few relics in it being carefully preserved.

It was at first intended that the Rolls Chapel, which has been very justly described as "singularly ugly and plainly built," should also be removed. But it has many associations and a rather curious history. Originally it was a hospital for converted Jews; and afterwards it was used for the storing of the early records of the Court of Chancery after they were removed from the Tower, subsequently becoming the Rolls Chapel. It was built during the reign of Henry III., at the King's expense, having then a tower, which disappeared many years ago. The Chapel itself, however, was in so good a state of repair that it was declared to be an act of vandalism to remove it. It was, therefore, arranged that the north wing should be carried on arches over the Chapel, which will subsequently be used again, as it was for several generations, for the storing of some of the more important of the Records.

In order to avoid danger to the safety of the records by fire, the most elaborate precautions have been taken in the new building. Only the smallest possible quantity of wood has been used. All the rooms are lined with iron. Doors of iron are provided everywhere. Hydrants and fire-extinguishing appliances are fitted to every floor; and there will be as few

people. The greatest surprise is created among both by the fact, not generally known, that there are two Domesday Books—though the singular number is invariably used in speaking of them. Those who see them for the first time are also surprised to find them no larger than an ordinary family Bible. The various old charters are curious and fairly complete, though lacking the most important, the "Magna Charta," which is in the possession of the British Museum.

DISCOVERY OF A NEW RACE.

LECTURE BY PROFESSOR PETRIE.

A LECTURE was delivered before the Royal Society, Edinburgh, by Professor Petrie upon the results of his recent archaeological excavations and researches in Egypt, which include the discovery of a new race, whose existence was hitherto unsuspected in that ancient land. After describing the district in which he and his companions had been at work—namely, between Ballas and Negahdeh, about thirty miles north of Thebes—Professor Petrie said that a quarter of a mile from the ancient Egyptian town of Nubt, which was discovered to be the centre of the worship of the prescribed god Set, lay another site of a town. Not only was a town found, but also a series of cemeteries of this same new race; and altogether nearly 2,000 graves have been completely excavated, every object noted in position, and

everything preserved and marked. The result of this thorough exploration was most strange and inexplicable. In this great number of graves not a single Egyptian object was found, and not one body was mummified or buried at full length; all were contracted, with the knees bent up to the arms. The position was always with the head to the south and the face to the west. The extent of this race is shown by their characteristic objects having been found abundantly as far north as Abydos and as far south as Gebelen. This is a district of rather more than a hundred miles in length, opposite to the Great Oasis and the Western Oasis, which would give access to it across the desert from the West. The age of this people was the next problem, and we can, said the Professor, definitely say that they were between the VIIth and IXth dynasties, or about 3000 B.C.; and they probably were the people who overthrew Egyptian civilization at the close of the old kingdom, and so pro-

duced that dark age of the VIIth and VIIIth dynasties, when the Egyptians seem to have been narrowed and oppressed by disaster. The arts were well advanced in most ways. In pottery these people excelled. The exquisite colouring of the red vases, showing every shade of crimson, with brilliant black tops, produced by being burnt in the ashes, is more rich than in any Egyptian ware. Who this unknown race were and from whence they came, said Professor Petrie in conclusion, cannot yet be decided. It may be proved in future that these were a branch of the same eastward migration of Libyans, which founded the Amorite race in Syria. But the remains of both the people and their works must be thoroughly studied, and further research made for other settlements of theirs, before positive conclusions can be drawn.

YESTERDAY afternoon, Sir F. S. Powell, Bart., M.P., formally opened, and handed over to the Borough, the Boys' Reading Room, in connection with the Free Library, at Wigan, which he has erected at his own expense, the cost being between £3,000 and £4,000. The building is situated in close proximity to the Free Library, which is regarded as one of the best in the industrial centres of Lancashire. Mr. Wm. Winnard, the contractor, handed to Sir Francis a golden key as a memento of the occasion.

DESIGN FOR DISTRICT OFFICES—BY FRANK T. BAGGALLAY.

fire-places as possible. Indeed, the latter are only to be provided in the rooms of the officials, which will be quite shut off from the store rooms by iron doors. As far as possible, everything is fireproof, the floors and staircases being of iron and stone, the roof of iron, while the windows have stone mullions and iron lights. It is in no sense a case of locking the stable door after the steed is stolen, for there is no nation in the world whose records have suffered so little from fire as those of this country, and though it is only within comparatively recent years that they have been brought under one roof, having previously been scattered over various public offices, they are singularly complete from the date of the Norman Conquest to the present year. And not only are they safely stored, but preserved in such a way that they are readily obtainable by searchers, of whom many every day avail themselves of the opportunity of investigating facts which have long since become part of the forgotten history of the country. Musty files of papers are constantly being overhauled by students, historians, and others. To the casual visitor these possess no attraction, save exciting a passing feeling of wonder that they should be worth the expense of keeping at all. For the mere sightseer, however, there are contents of perennial interest. Foremost among these are, of course, the Domesday Books, which, somewhat singularly perhaps, have an even greater fascination for Americans than for English

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
23rd April, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

ARE Free Libraries equipped in technical information? Answers in the negative point to the preponderance of fiction, and to the devotion of an undue share of the public monies to that less substantial section of Literature. Imagination is all very well, they say, but we want concrete knowledge. The Science and Art Department appears to take this gloomy view. Grants to free libraries for the purchase of technical books having been made by some County Councils, correspondence has taken place between the London County Council and the Science and Art Department on the subject. While the Department says that such grants to free libraries are, under certain conditions, legitimate, it does not consider them advisable. Among the reasons it gives are "the unsatisfactory proportion of money spent at present by the Free Library Committees on educational literature," and "the consequent belief that the funds of the Technical Education Committee would be used to set free rate funds for the purpose of purchasing works of fiction, if not possibly even for the relief of the library rate."

THE excavations by the American School at the Heraion of Argos, in Greece, under the direction of Professor Waldstein, which were resumed this spring, have been very successful. Two hundred and fifty men have been employed on the work. Besides the two temples and five other buildings previously discovered, a large, well-preserved colonnade, 45 metres long, has now been found, twenty-five feet below the surface, south of the second temple. The discoveries include parts of metopes, two marble heads of the best Greek period, a hundred objects in bronze and gold, gems, vases, and terra cottas of the Homeric period, as well as numerous scarabs, several Mycenaean tombs, with Argive inscriptions on bronze, probably of a religious character. The excavations, which are now in the fourth season, will be completed this year. They rival the French excavations at Delphi in magnitude and importance, representing all the periods of Greek life from pre-historic to Roman epochs. They have given specimens of sculptures and architecture of the Periclean age, and have already produced more material for the history of the earliest Ceramic art than any excavations hitherto made.

WE are glad that success has so far attended the movement initiated a while ago by Mr. Dethridge, vestry clerk of Paddington, for doing fitting honour to the memory of Mrs. Sarah Siddons. Her last resting place in Paddington Old Churchyard—now transformed into a public garden—is

merely marked by a slab of cement with an inscription cut in its upper edge, and enclosed within unsightly iron railings. It is now contemplated not only to make this tomb worthy of the memory of Mrs. Siddons, but also to have a handsome marble statue in a prominent position on Paddington Green, facing the Harrow Road, and within a few yards of the grave. Besides the gifts of influential local residents and most of the surviving members of the Siddons and Kemble families, liberal contributions have been made towards the proposed memorial by the Duke of Westminster, the Dean of Hereford, Miss Ellen Terry, Lady Martin, Madame Antoinette Sterling, Mrs. Sarah Lane, Mr. H. Irving, Mr. S. B. Bancroft, Mr. J. L. Toole, Mr. J. Hare, Mr. A. W. Pinero, Mr. H. A. Jones, Mr. G. Alexander, and Mr. Augustin Daly. Up to the present Mr. Frank Dethridge, the honorary secretary and treasurer of the fund, has received about £150, but the committee which has been formed to carry the project to a successful issue hope that a much larger sum—essential to the due execution of their designs—will be finally forthcoming, and that thus, after the lapse of sixty-four years since her death and interment, a memorial befitting the genius of Mrs. Siddons will be erected.

FOLLOWING up our recent article upon the prevention of dry rot, we have made some inquiries as to what is known as the Haskin method of treating timber. The inventor, Colonel Samuel E. Haskin, contends that the mode now universally adopted of seasoning wood—by the extraction of the sap—is altogether wrong. The sap he regards as the life-blood of the wood, and to take it out is to ensure its destruction. The most effectual way to preserve the timber is to treat the sap within the pores of the wood in such a way that "the whole of its life-preserving properties are retained and solidified within the substance itself." The Colonel claims that by his method—practically vulcanising the wood—the Haskin process does in a few hours what Nature would take years to effect. It is, perhaps, needless to state that the Colonel is an American, seeing that the proofs of the excellence of the process are drawn from the United States, where, we are told, "vulcanised railway sleepers have had a thorough time-test, and so far as is known timber so treated will not rot." Examples of the vulcanised wood have been brought to England for inspection by Municipal and other authorities. If this method be reliable, great has been our sin of commission in the past!

THE Continental capitals and many other foreign cities of note would appear to be suffering from exhibition enterprise—a modern malady. There is, for instance, the approaching International Exhibition of Art in Venice, and Paris is well ahead with her plans for the Exposition of 1900. Of Russia's forthcoming exhibition we have given particulars, and Germany is also in the field. At the Industrial Exhibition, to be held in Berlin next year, the Colonial Section is to be made a specially prominent feature. The first main group will relate to the growth of the German colonies and the developments of their colonial commerce. In the second group, great numbers of the natives of different parts of Africa and Emperor William's Land, will be shown to the visitors. The small troupes of natives that have heretofore been exhibited in different places of amusement, will be totally overshadowed by these "exhibits." Exhibits is the official word—rightly or wrongly applied to human beings. As for the Paris Exhibition, it is to cost four millions sterling, and will cover an area of nearly two thousand acres, including the Champ de Mars and all the open ground

near it, the Esplanade des Invalides, the Trocadero, the Jardin de Paris, the present site of the Palais de l'Industrie, and all the quays between the Bridges of La Concorde and Jena. To prevent the crowding of any particular point, entrances will be numerous, and two of them will be monumental. The grandest will be in the Champs Elysées, where the Palais de l'Industrie now stands. This portal will open on the future avenue which, by means of an iron bridge, 325 feet by 360, is to connect the Esplanade des Invalides with the Cours-la-Reine. The parapets of this bridge are to be extremely light, and to imitate lacework, the object being to prevent the shutting out of the view of the Seine.

WHAT a terrible dearth of matter there is for our architectural contemporaries these two weeks past. What would happen if authors of papers, read before the various societies, were suddenly to be struck dumb can be ascertained by glancing at our friends over the way. One of them devotes *five pages* to a tabulated "retrospect" of Bath Stone with A B and C diagrams in full working order. Another devotes *six columns* to "Books Received," as far back as the 1893 Report of the Department of Public Works, New South Wales, and another gives *seven pages* of "British Museum," unblushingly. *The Architect*, humorously nicknamed the Advertising Mausoleum, is positively becoming a journalistic monstrosity. It has in its current issue less than 2,000 words of original comment.

ROSENEATH, which has been purchased by the Marquis of Lorne from the Duke of Argyll, is well known by name and description to readers of Sir Walter Scott's "Heart of Midlothian." It was here that the famous John, Duke of Argyll, familiarly styled "Ian Roy Cean," established the experimental farm which he put under the charge of douce David Deans; and here also the heroine of the tale, and her husband, the Rev. Reuben Butler, were settled. Scott refers to Roseneath again and again as an island, but this is a mistake. It really forms part of a peninsula, connected by a narrow neck of land with the rest of Dumbartonshire. This peninsula is washed on the eastern side by the Gare Loch, and on the western side by the waters of Loch Long, and its extremity juts out into the Firth of Clyde. Roseneath for a long period was an occasional residence of the Earls and Dukes of Argyll, who used it as a fishing and hunting lodge. The district is famed for the picturesque beauty of its scenery.

THE restoration of St. Giles's Church Tower, Newcastle-under-Lyme, was celebrated on the 13th inst., by the unveiling of a portrait of Mr. F. Stanier, of Peplow Hall Salop. Mr. Stanier recently restored the Tower at a cost of £5,000, and he has furnished the portrait to be placed with others on the walls of the belfry as a memento of the event. The Tower having stood for more than six hundred years, had fallen into decay, and Mr. Stanier, as a memorial to his ancestors, and out of veneration for the structure, decided to restore it to its ancient beauty. The operation has been carried out with careful regard to the preservation of the ancient work, and one or two modern additions which were incongruous and out of character have been removed, with the result that St. Giles's may now be regarded as possessing a high perfect specimen of a thirteenth-century Tower.

THE Leeds Waterworks Committee and City Council have been devoting much time to the proposal for a single ornamental fountain in some public place of the city. This is one of the things they do better in

France, for we take even our fountains sadly! We read, the other day, that the Paris Municipal Council voted a sum of £8,000 to restore and repair the monumental fountains which adorn their city. Paris has always been justly proud of her fountains, and among them are several which might be studied with advantage by the architect selected to design the work of which Leeds dares to indulge some reasonable hope. The story has its other side, however, for instead of being able to boast of a virtually unlimited supply of pure water, the Parisians are so anxious about the future that they are considering extensive schemes for the filtration of the river water. The last thing they would think of would be a diminution of the public fountains or a cutting off of the supply of water that feeds them.

ACCORDING to Board of Trade information, engineering and kindred trades continue to improve, the percentage of unemployed

A COTTAGE AT BROMLEY: FRANK T. BAGGALLAY, ARCHITECT.

members in unions connected with these trades at the end of March being 7·8 compared with 8·3 for February and 9·1 for March, 1894. Employment in the shipbuilding trades improved on the whole in March, and the percentage of unemployed members in unions making returns fell from 16·3 to 12·4, which compares with 13·3 per cent. in March, 1894. The building trades have resumed active operations, and the percentage of unemployed in unions making returns has fallen from 10·1 to 4·9, compared with 3·5 per cent. in March, 1894.

EXPERIMENTS in afforestation, recently made by Lord Rothschild, at Tring Park, are useful in showing what can be done by scientific planting. On the cold and sour soil of the Hertfordshire Hill Tops the owner of Tring Park planted larch, Douglas fir, and beech, but chiefly larch. His Lordship's agent on the Tring estate felled the larch trees off 700 poles of land a few years ago, and sold this timber by auction for £638, the buyers undertaking to fetch it away at their own cost. The plantation thus demolished had stood only for seventy-five years, but yet timber was remarkably well grown. Lord Rothschild is not by any means sure, however, that afforestation will pay. Timber may get cheaper, and in any case it is only worth while to plant such land as cannot be farmed. As things are, the annual thinning sale of his 400 acres of forest at Tring realises about £1,000.

THE primary schools in France give pupils an elementary acquaintance with art, which creates a demand later on for some kind of graphic supplement to the legends and facts of history absorbed at school. Then, too, local pride tends to foster the art instinct there as perhaps in no other country. A youth in any distant department or unimportant French town, who shows a peculiar aptitude for drawing and painting, is often encouraged and aided by a public purse to continue the cultivation of his gifts in the

art schools of Paris. As records of his progress there, and in recognition of this assistance, he sends home from time to time examples of his work, which become the property of his native place. You can come across paintings of superior quality in the museums of comparatively insignificant towns, and they often enough prove to be the productions of a local genius who, on the road to fame, has acknowledged municipal benefactions by perhaps a "success" from the Salon, or by the customary contribution expected of him by the authorities. Something might surely be done in this fashion for the encouragement of British art students.

ANOTHER instalment of Mr. Richmond's decorations at St. Paul's Cathedral was opened the other Sunday. It consists of the second saucer Dome, the subject being the creation of fishes. It is even richer in colour and more brilliant than the one unveiled last year. The pendentives are finished, as are also two more Clerestory windows, which are heavily-leaded and admit a subdued light. Figures of sibyls and temple builders fill up the intervening spaces. The final section of the Choir is now being undertaken.

THE miniatures, drawings, and paintings of Richard and Maria Cosway will form the principal feature of the Art Exhibition which is now held every year on behalf of certain East-end charities. The locale of the show will be the new house of Mr. John Gretton, in Ennismore Gardens. Contributions have been promised by many owners of valuable Cosways. All owners of these artists' pictures or miniatures who are willing to assist are invited to communicate with the Hon. Mrs. Lowther, at Lowther Lodge, Kensington Gore, who has undertaken the control of this section of the Exhibition. The Exhibition will be open from the 6th to the 10th of May.

LA MARIA BERGAMO, MAGGIORE: A SKETCH BY FRANK T. BAGGALLAY.

THE Holmenkollen Hotel, on the heights near Christiania, recently destroyed by fire, was an historic hostelry. Here the King entertained the Kaiser of Germany when, in 1890, the latter paid his State visit to the capital of Norway, and since then it has been visited by the Empress, as well as by the Princess of Wales and her daughters, and the Archduchess Stephanie of Austria. It was a favourite health resort, and was specially "Holmencolonised," as the English said, at Christmas, Easter, and Whitsuntide. The

greatest loss, however, has been the destruction of a most valuable and unique collection of Norwegian antiquities, including priceless tapestries which had been gathered together by the proprietor of the establishment.

In the Art World things seem to be looking up a little. Several important pictures that will be in the Academy next month have already been sold. Sir John Millais has disposed of his Moonlight pictures. Mr. Tate is the buyer, and so it will go to the collection he intends to give to the nation. Mr. Waterhouse's beautiful "St. Cecilia," rumoured to be one of the two or three great pictures of the year, has been sold. Mr. David Murray also comes within the fortunate few with one of his six-footers, and Mr. McWhirter, has also sold a landscape, Caledonian in subject. Mr. Tadema's "Love Token" will be an addition to the Duke of Westminster's collection.

THE Academy of Natural Sciences, Philadelphia, recently carried out an excavation of the Metzgar Indian Mound, on Deer Creek, Yellow Bud, Ohio, and found the skeleton of a man, who seems to have been a great chief, with copper ornaments and shell beads. The remarkable feature of the "find," however, was a "funeral tree," or log of cedar, about 18 ft. long and 5½ ft. in girth, which covered the skeleton at a depth of 10 ft. below the original level of the ground. Cedar saplings had been laid against the log to form a kind of tent above the body, and the whole had been covered with ashes and earth.

LIGHT railways appear to be "moving." The Duke of Westminster has decided upon constructing at Eaton a narrow-gauge railway similar to that on the estate of Mr. A. Percival Heywood, at Duffield Bank, near Derby. Mr. Heywood has undertaken, at the request of the Duke, to lay out the course of the intended line from Balderon sidings on the Great Western Railway, near Chester, to Eaton Hall, a distance of some three or four miles, also to superintend the laying down of the permanent way, and to construct a locomotive and waggons on the same principle as his own. On a fair calculation, the railway when completed, in about nine months' time, will allow of a 20,000 ton haulage per annum if worked anything like full time. The cost of the line, when fully equipped, will be about £1,200 per mile. A cable railway, 3¼ miles in length, has been constructed across country in Derbyshire by a private firm to the town of Derby, traversing the country from the village of Stanley and passing through the intervening parishes of Morley and Chaddesden. If 600 tons per day were carried it is estimated that the cost in labour, including repairs of the road, would not exceed 1d. per ton for the whole distance. This is one of the longest cable railroads in England.

DR. GARNETT says that the 3,000,000 entries in the British Museum catalogue represent something like 2,000,000 books. In 1838 there were only 450,000. The question of finding space is becoming a very serious one, though it is only a few years ago that by the simple contrivance of a sliding press, the accommodation was trebled without extending the space. Since the late sensible rules were introduced checking the issue of current fiction, Dr. Garnett thinks that at least nine-tenths of the readers use the reading-room for some legitimate object of study or reference.

MR. W. S. LOFTIE is the writer of the April number of the "Portfolio," which deals with the history of Whitehall, and is prefaced with a capital portrait of the man whose name is indelibly associated with the architecture of the district—Inigo Jones.

Mr. Loftie gives in detail all the historical facts obtainable about the Royal personages who have inhabited Whitehall, and satisfactorily settles the question why a hole was broken through the wall of the Banqueting Hall to allow Charles I. to reach the scaffold on which he was decapitated. The number is admirably illustrated with unaccomplished designs by Inigo Jones. Many other illustrations and several reproductions of old plans of Whitehall make the number of especial interest to architects and archaeologists.

ANOTHER volume of "The Studio"—the second—continues in excellence what was well begun. The papers are marked by breadth of view and a robust appreciation of many men and many styles. Much attention is given, not only to the work of individual artists, but to the trend of artistic impulse as shown in the schools and the exhibitions. Foreign art is generously entertained, as well as native art. Nor is any special leaning markedly shown to any particular tendency. The Letters from Artists to Artists afford opportunities for criticism. The illustrations are a little unequal in value.

THOSE interested by an Exhibition of Art Furniture, might have spent a fairly profitable time at the Agricultural Hall, Islington, last week. The exhibits covered the whole field of household furniture, appliances, and upholstery, ranging from nick-nacks in domestic ornamentation to such solid specimens of utility as improved sanitary baths and iron sofas. The various stands devoted to the newest fashions in sitting and bedroom furniture proved that there was no decline, but rather an increase in the taste for articles of Japanese design, especially for those of bamboo make.

THE ancient gateway, standing on the northern quay of Calais Harbour, which greets the tourist on his arrival from Dover, is about to be demolished. For nearly three centuries it has withstood the crumbling influence of time, and to this day stands as firmly as when it was built by Cardinal Richelieu in 1633. The old portcullis still shows its rusty teeth in the blackness of the slit at the top of the arch. In the place of this venerable monument of the power of the great Cardinal an avenue is to be laid out, forming a boulevard to that part of the town.

AN unusual scene was witnessed at the annual vestry meeting for the parish of Manchester, held in the Cathedral. A speaker, a worthy but somewhat "Low" Councillor, referred to a Reredos which has been placed in the Chancel of the Cathedral, and described it as an "ugly excrescence." Another said that the Reredos was both odious and idolatrous. An amendment, substituting "Low" for "High" men, was declared lost, but after a second count the Dean declared it carried. The announcement did not give satisfaction, and an attempt was made to arrive at the strength of the two parties by dividing them, for which purpose the Cathedral Aisles were used. This also was a failure. The Dean suggested as a compromise that one candidate from each side should be selected for the two vacancies out of the four names before the meeting. The mover of the amendment was willing, but the seconder remained obdurate, though he was appealed to by the Dean, "in the name of our common Master and for the sake of peace," to accept the compromise. Eventually the amendment was declared to be carried, and Mr. Alan Maclure, a "High" man, was thereby displaced. It is a pity the Reredos controversy cannot be settled by a little common sense. But we fear the matter has gone too far for compromise.

A LONDON correspondent writes:—"I learn from a private correspondent at Washington that the United States Navy Department has taken an important move towards the adoption of nickel steel for marine purposes. It has just been decided that the new boilers of the first-class cruiser *Chicago* should be constructed of this alloy, as the Carnegie Company had demonstrated that nickel steel was not only less subject to corrosion than pure steel, but would stand enormously greater tensile strain. It is long since this fact was demonstrated by Mr. James Riley, of Glasgow, but the price of nickel has hitherto stood in the way of extensive adoption. The price is, however, decreasing steadily with the greater use and production, and there is better prospect of extensive adoption. Moreover, only a small proportion of the alloy is nickel, and there is a great saving in weight, and therefore in first cost as well as in maintenance. The tensile strength of nickel steel boiler-plates is once-and-a-half more than that of pure steel, so that it would be possible in the *Chicago* to reduce the thickness by about a third, which will effect a great saving in weight for the same power, and this is a great consideration. The Steel Board or Committee of the Navy Bureau at Washington, too, have decided that the constructive department should adopt nickel steel in the new warships, and they quote Mr. Riley's results in their case."

RAPID progress is being made with the erection of the Pier Head Station, Liverpool, which is primarily designed to facilitate the conveyance of American passengers from the steamers to their destination, whether it be London or elsewhere. The work was started at the commencement of the year, and it is anticipated that it will be ready by the 1st of June, the time originally fixed, though the officials are sanguine that it may be opened for traffic a month earlier. The site is on the west side of the Prince's Dock. When finished the station will be about 800 feet long and some 85 feet wide—a lofty, well-lighted, and well ventilated structure, and will contain several waiting-rooms, lavatories, and all the equipments of a first-class railway station. There are some half dozen entrances to enable passengers to pass without delay from the Luggage Examination Offices to the station to their trains.

ONE by one the old taverns and posting inns are succumbing. The old Horse Shoe, Newington-causeway, has now been pulled down, and a new house put up on the site. A public-house has been there for upwards of 200 years, for a tavern token was issued from the house in 1667, when John Ives was probably the first landlord, as no building is shown there upon maps of an earlier period. The recent finds in the course of the necessary excavations consist of coins from the time of Charles II. to the present century, about twenty of them together in a small box. Further there are fragments of pottery and glass of the Roman time, a horse shoe, a tusk of the wild boar, a great quantity of bones of the horse; and, under the front of the old house, about six feet from the surface, there was a perfect skeleton of a man of great stature, and the burial seemed to have taken place a very long while ago. Among other finds were a well-made seventeenth century knife, some pottery of the Elizabethan and other periods, and tobacco pipes from the time of Charles I. The old inn seemed to have been once struck by lightning, for a portion of a meteoric stone was found embedded in the gravel. A good deal of interest was taken in the old Horse Shoe during the Wilkes and Liberty Riots in 1768, because William Allen, son of the then landlord, was pursued by a soldier into

the cowhouse at the bottom of the yard and shot. A picture of the incident has been engraved.

EDINBURGH is lit up by electricity for the first time. At a cost of about £120,000, the Corporation has laid down sufficient plant to illuminate 21½ miles of streets and the shops and houses of any consumers who may apply for light near the centre of the city. The generating plant includes engines of 1,620 horse power, and an equivalent set of dynamos of both high and low tension—for the distributing system adopted is the low-tension three-wire system. Prince's Street is to be lighted with arc lamps 50 yards apart, of 3,000 candles each. These, hung on artistic brackets over the northern causeway, will make undoubtedly a brilliant display. In all other streets the public lamps (175 in number) will be of 2,000 candles each. A difficulty peculiar to Edinburgh has had to be overcome in many streets. There are cellars under almost all the pavements, and these, as a rule, leave little space between their roofs and the flags for the laying of mains.

THE town of Abbeville, on the highroad between Boulogne and Amiens, was far better known to English travellers a generation ago. Though tourists who catch sight, from the railway, of the magnificent flamboyant west front of the great Church which Cardinal George d'Amboise began to build at the end of the fifteenth century, often determine to explore the old streets, the intention is seldom carried out. The valley of the Somme is not otherwise attractive, save to architects and students of history, who make it a starting-point for exploring the scene of the campaign of Cr cy. Abbeville is comparatively neglected both by Americans and our own countrymen. But the old home of the Counts of Ponthieu will, in the course of a few weeks, be the scene of a stirring and picturesque festival, one of a kind that is becoming less and less frequent in this country. On the 19th of May the town will be *en f te*, and thousands of visitors will doubtless pour in from the neighbouring towns and villages, attracted by a festival which will take the shape of a great historical calvacade. The history of the town will be represented by seven distinct spectacular processions illustrative of its principal episodes. The Gallo-Roman period will be the subject of the first group; then there will be the gathering of the Crusaders and their departure from Abbeville, with Godfrey of Bouillon as leader; the third group will include the more famous of the kings and princes who came to Abbeville during the Hundred Years' War; and there will be a special pageant representing the expulsion of the English from the town. The marriage of Louis XII. will be the sixth subject, after which there will be a long jump to the entry of Peter the Great into Abbeville; the hero of the last procession will be Admiral Courbet at the taking of Sontay.

THREE Egyptian tomb paintings given by the Committee of the Egypt Exploration Fund, have just been placed on exhibition in the Sculpture Gallery of the Egyptian Department, British Museum. One of these is a very fine specimen of the art of ancient Egypt. It represents a woman dressed in a long gown, open at the neck and reaching down to the feet. Around her neck is a large collar as was usually worn by officers of the Court, and persons of rank. Her hair, which hangs loose, is tied around the head with a fillet, the two ends of which hang down behind. The gown is painted green, but the face and neck a light yellow, this colour being the one usually used for women by the ancient Egyptians. The second sculpture represents four persons kneeling down, each within a kind of square,

and separated from one another. These figures are painted red upon a blue background. The third object depicts two men—one standing up, throwing seed over his back, while in front of him the other is busily engaged working up the ground with a hoe. These sculptures, which show us the art of the Twelfth Dynasty, come from the tombs at El Bersheh.

THE authorities responsible for roadside lands and village greens, need to furbish up their knowledge of what law there is in the matter, and as to this the "Dept." is about to refresh their tardy memory. A memorandum designed especially for Parish and District Councils, acquainting them with the powers they possess with regard to the preservation of roadside waste land, village greens, and recreation grounds, is being sent round, and here is the gist of the document: Where on either side of a public road strips of land exist open to the public, between the metalled road and the fences beyond, *prima facie* the public right of way extends, unless there is evidence to the contrary, over such strips or roadside wastes, and they cannot be lawfully enclosed by the owner of the adjoining land, or by the lord of the manor, or by any other person. Such strips may be of varying width, and the adjoining owner has no right to straighten the line of his fences by taking in any part of the roadside waste. It is not uncommonly believed that there is a right to enclose up to 15 feet from the centre of the road. This is not so. The public, unless it can be proved to the contrary, has the right to the whole of the roadside waste between the fences and the road. The fact that trees or shrubs have been allowed to grow up on these roadside wastes so as to interfere with their use by the public, does not necessarily destroy such right or justify their enclosure. As in the case of foot-paths, the County Council may proceed in instances where the waste has been encroached on before the Act of 1894. Village greens and recreation grounds are placed under the direct protection of the Parish Council or Meeting where the parish is too small to have an elected body. Where on any open land the inhabitants of a village or parish, from time immemorial, have been accustomed to play games, such custom practically constitutes the land a village green, and the inhabitants cannot lawfully be deprived, by enclosure or otherwise, of their right to use it. In such a case, where any attempt is made to injure the green or to interrupt its use as a place of exercise and recreation, the Parish Council may proceed against the person committing such act before the justices, and such person, if convicted, is liable to damages and penalties.

THE competition was smart at Tokenhouse Yard last week. For the usual small brick-and-mortar investments there was a capital demand, freeholds in Hackney changing hands at from eighteen to twenty-five years' purchase of the existing rentals. A few good City lots were on offer, but, although bidding was fairly active, very little business was done. The public market for West-end residences is still unsatisfactory, but important transactions continue to be effected daily by private contract. It was an unusually heavy week for stocks, shares, and reversionary interests. Although the auction season for large landed properties will not begin till late in the present month, when

the vast Somersetshire estate of Wrington will be brought to the hammer in Bristol, good business continues to be done by private treaty.

THE position of the engineering trades is more satisfactory than it has been for some time. The monthly returns issued by the Amalgamated Society of Engineers show a reduction of nearly 1 per cent. in the number of unemployed. A steady decrease in the number of unemployed members has been shown since the beginning of the year. The Steam Engine Makers' Society also reports a reduction of 1 per cent. in the number of unemployed members as compared with last month. The officials of the trade union organisations are looking forward to increasing activity in the near future.

BRICKMAKERS and tilers of Vienna, numbering between four and five thousand, went on strike on Wednesday morning for an advance of fifty per cent. in wages. The offer of the Kilns to raise the price of piece-work from fifteen to thirty per cent. was refused. This time last year a strike in the same trade resulted in an advance of twenty per cent., and subsequently an additional five per cent. The weekly wages of the brickmakers amount now to from thirty to thirty-six shillings, besides free dwellings in the houses belonging to the Company.

THE English colony in Rome has sustained a loss in the death of Dr. Edwin J. Miles,

HOME LOCH, ALLEN, IRELAND: LEONARD STOKES, ARCHITECT.

who acted for many years past as Honorary Secretary to the British and American Archaeological Society. Dr. Miles had found the Society in a languishing condition, and had really helped to infuse new life into it by his untiring zeal and unflinching courtesy and kindness in the discharge of his honorary duties. His funeral was the occasion for a display of sympathy and regret. England and America were represented by their respective Consuls, and among the many wreaths surrounding and covering the coffin was a large one tied with broad white ribbons, on which, in letters of gold, were inscribed the words, "The British and American Archaeological Society, to its devoted Honorary Secretary."

MAJOR CARDEW's report as to the circumstances connected with a series of explosions which occurred on Southwark Bridge was published on Wednesday. The inspector observes that the existence of numerous empty pipes in the system of mains laid by the City Electric Lighting Company greatly facilitates the passage of gas should it find access in considerable quantity at any point. This accident appears to suggest far more serious cause for anxiety than that which occurred in Cannon Street, and the most striking features are:—1. The distance to which it appears that a series of explosions may travel along the electric mains which form a gigantic network under the whole of the streets of the City; and (2) the proof it

affords of the insufficiency of any ordinary system of ventilation of pipes and street boxes. The report adds that the accumulation of gas should be prevented by thorough ventilation, by making the sides and bottoms of street boxes impervious to gas, and by filling up the boxes as far as possible with incombustible materials. So far the Electric Light Company had done very little towards carrying out these requirements. It must be admitted that in the case of the explosions on Southwark Bridge the main cause was the defect in the gas pipe, and it again directed attention to the very serious danger to the public arising from the condition of the gas pipes in many districts, a danger which was continually increasing, owing to the spread of the use of wood paving and other impervious surfaces, and which was temporarily intensified by every frost. He recommended that the Board of Trade should require the City of London Electric Lighting Company to at once take necessary measures to fully comply with the regulations imposed upon them for the protection of the public safety.

YET another case of petty or rural interference—rather more glaring than usual. At King's Heath, two builders, of Cotteridge, were summoned, at the instance of the King's Norton Rural District Council, for infringing the bye-laws, by constructing houses in the Midland Road, King's Norton, with bricks unfit for use. Mr. R. Godfrey (surveyor for the Council) said he inspected the buildings on April 2nd, and found that the bricks were not good. He had samples, and took them to the Selly Oak Workhouse, where the Council was holding a meeting, and the bricks, on being examined, were condemned. Mr. Pritchett, for the defence, said the case was of considerable importance to builders. The firm who had supplied the bricks was engaged in extensive building operations at Cotteridge, and for the bricks used to be con-

demned in that wholesale manner was a very serious matter. The builders had been given no opportunity to speak, and, therefore, they must have their say now. Mr. Pritchett called the manager of the firm who supplied the bricks, a Mr. Owen, architect, and several bricklayers, to prove that the bricks used in the buildings were sound and good; as well as the foreman of the bricklayers, who said that the samples had been taken from a heap of rejected bricks. The "case" was dismissed.

In the course of his report on the scheme for the construction of a road round the Scarborough Castle Hill, Mr. James Abernethy, the engineer recently engaged by the Scarborough Corporation, is generally in agreement with the report made by the late Sir John Coode some twelve years ago. He agrees that the work contemplated will prove of great advantage to the town, and approves generally of the direction of the proposed drive laid down by Sir John Coode. With regard to the ultimate cost of the proposed road and wall, he is of opinion that the sum of £70,000 is sufficient, including the cost of certain works on the face of the Castle Cliff. Mr. Abernethy holds that the proposed seawall will in no way prejudicially affect the tides and currents, neither will it render the entering or departing of vessels from the harbour more difficult. On the most important subject, as to the cause of landslips which take place from the Castle Cliff, and as to whether, in order to ensure the safety

of the proposed new road, it will be necessary to interfere with the face of the Cliff, Mr. Abernethy states:—"The base, or low portion of the cliff, is generally composed of clay shale, with occasional sandstone rock, the upper portion being of a harder character, mostly composed of sandstone rock and limestone, and therefore less subject to decay, overhangs in large masses, which might become detached at any moment. The main object in placing the intended wall so far from the base of the cliff was to avoid the danger from this cause, but I am of opinion that it would incur great risk to allow these masses to become detached of their own accord, after the drive is constructed, and I strongly recommend that steps should be taken in the first place to scarp down the face of the Castle Cliff. This should be carefully done by blasting and other means, under competent superintendence. The material removed from the face of the cliff can be utilised profitably for concrete and in filling up the space between its base and the proposed road, the construction of which, together with the removal of the projecting and overhanging portions of the cliff, would secure the future stability and safety of the proposed works."

THERE is much charm in Mr. Mallows' drawings of the House at Staplefield, which was erected by Mr. Frank T. Baggallay, some time ago, for a client making astronomy his hobby. The delightful house, entirely free as it is from the fidgetty effect of eccentric design, is beautifully situate on the west side of the Brighton Road, and has a fine Observatory in the grounds. The local bricks being of poor quality, the walls were rough cast, the modelling of the South Gable—so the architect generously informs us—being the work of Mr. J. E. Knox, the architectural carver. Including an Entrance Lodge and the Stables, the work cost just less than £5,000. The engraved block, from Mr. Baggallay's own wash-drawing, is of a Cottage in a fine position in Bromley Park, overlooking the valley to the west and south-west. The view shows the long stretch of roof, the bays of the principal sitting rooms, and the lantern which lights the staircase. The cost was about £1,200.

WITHIN two or three months the statue of the Queen, which is to be placed in the vestibule of the Royal Exchange, may be completed. The commission to execute the work was given to Mr. Thorneycroft, by the Corporation of the City of London, several years ago. The price agreed upon was 2,000 guineas, but no undertaking was given as to when the statue should be finished. The plaster cast was completed as far back as last October, and the work on the marble block has since been proceeding. The Royal Exchange, it may be re-called, was originally opened by Elizabeth in 1571. It was destroyed by the great fire in 1666, but afterwards rebuilt, only to be again burnt down in 1838, and the Queen opened the present building in 1844.

AN extension to the Blackburn Church of England Higher Grade School was commenced last week, Messrs. Stones and Gradwell being architects. The plans include a Schoolroom for mixed classes of 120 juniors, and a Schoolroom for 99 infants. These are to be well fitted up with separate cloakrooms, and the lavatories and usual conveniences are to be admirably arranged. A capital feature will be the covered march ground connected with the play ground, and the heating and ventilation of the whole building are to receive the most careful attention. The building is to be faced by parpoints, and the dressings are to be of Yorkshire stone. The work, the cost of which will be about £2,500, will be pushed forward with all possible speed.

The Builders' Journal.

MEN WHO BUILD.

NO. II.

MR. W. B. RICHMOND, A.R.A.

PROPHET in his own country! You remember the delightful series of lectures delivered some thirteen or fourteen years ago, by several artists of eminence, with the primary purpose of providing much-needed funds for the Society for the Preservation of Ancient Buildings. Mr. Richmond's lecture upon "Monumental Painting" gave you the greatest interest; and almost at the termination of the paper, he delivered this very trenchant remark:—"The influence of the sister arts (of Architecture, Sculpture and Painting) one upon the other must cease. Sculpture is to assert her independence of Architecture; she is to run loose of all constraint and to become, for a time at least, hopelessly imbecile. *Painting is to be picturesque not monumental; her ordered garments are to go in tatters; her serious demeanour is to be changed for the flush of lawless liberty.*" It is far longer back than fourteen years since Sculpture began to assert her independence. It would have been nearer to assert that the independence came from Architecture, who gradually dispensed with the affections of her younger sister, and then broke away entirely from her. Almost with painting, likewise. We have no privileges with monumental art. Our Churches are caves, as Mr. Richmond himself has remarked, or white-washed sepulchres, uncoloured, or if coloured at all, only in parts, patchily and with little general idea of design; and such designs as have been attempted, are formed, for the most part, after mechanical patterns and mechanical colours, under the uniform glitter of tile glazes. And, indeed, there is no hope, not even the semblance of a wish, that the demand for real decoration will arise

or the necessity for it in our Churches and public buildings ever become a part of public feeling. The dreary commonplace platitudes upon morbid or sentimental daily life are self-satisfying to the multitude of art lovers. The impossible forest glades with impossible lights, the boundless blue of the boundless sea, the unfortunate woman with a past, little bits of dog life, and the bloody unrealities of wars, are the deepest thoughts and aspirations of the present man.

Without the arts of Italy, we might be content; there would be no retrospect. In Italy we can discover how monumental

painting grew and under what conditions it flourished, and how the union between the sister arts produced all that is monumental in Italian painting. In the first place the architect, the sculptor, and the painter of Italy did not hold separate functions. All the three arts were in harmony, and in most instances combined in one man; but that man was not a member of a professional society, he was not a sanitary inspector, he was not even a city building speculator—he was merely an artist. Giotto, Brunelleschi,

BEAVOR LODGE: THE HOME OF W. B. RICHMOND, A.R.A.

Andrea Verrochio, Mantegna, Raphael, Leonardo da Vinci, and Michael Angelo, are names that recall masters in each separate sphere of the fortunate Arts. If all these men did not practise Architecture, Sculpture, and Painting, they were at least conversant with them, and were complete masters of their principles. That complete union of the three which existed—in Italy and Greece, at any rate, from the earliest times, each

A RECORDING ANGEL IN THE APSE OF ST PAUL'S :
W. B. RICHMOND, A.R.A.

having achieved the power of expression sufficient for a separate existence—led to the maturity of the noblest characteristics by the habit of mutual constraint, and wherever Architecture, Sculpture and Painting have remained hand in hand in unison, they have clearly defined the natural and philosophic limits of one another. This just limit of each Art, over which there must be no trespassing, was, in the purest times, perfectly understood and recognised. Architecture enriched her lines with Sculpture, her spaces with Painting. At the same time, both Sculpture and Painting were guided and constrained by the severity of contact with the austere lines, the mathematical proportions, and, above all, the conditions of lighting imposed upon both by Architecture. While it is the function of Sculpture to enliven and enrich, both with subject and ornament, the baldness of many architectural forms, no structure should be weakened thereby, nor should simple masses of unadorned space be encroached upon or broken up. The builder has taught the sculptor symmetry, proportion, construction, and restraint, and, as he becomes riotous and unregardful of simplicity, the sculptor follows him. Italian Sculpture and Painting of the twelfth century, and on even to the seventeenth, were all in unison. The three arts lived together in constant contact, and there has been no time whilst they remained acting in conjunction that a common influence failed them. By Architecture also has Painting been restrained. Think of the mere shell of St. Mark's! What can be simpler of construction? Yet every space is so inviting in form, so suggestive of decoration, that it seems constructed for the purpose. The windows are few, but the proportions are grandly simple, and suggest the employment of the brilliancy of gold, its glitter, and its reflecting qualities. The designs of the mosaics are masterpieces of decoration, and for colour are as perfect as any the World possesses. It was through St. Mark's that the great revival of the arts of Italy came

about; and if we would understand the principles of design that governed the art of Giotto—the outcome of Greek tradition grafted upon an Italian spirit—we must study the Greek Mosaics in Venice, in Ravenna, and in Rome.

Who knows all this better than W. B. Richmond? He has stood many times before the mosaics in St. Vitale, which the artists of Ravenna created in the 6th century, and before the figure of the Virgin in the Church of Torcello, "that mighty mother of awe-inspiring dignity and beauty." He has worshipped at the Shrine of Masaccio, who painted the frescoes in the Brancacci Chapel in 1428, with all their fulness and richness and harmony of colour, but in the monumental art of Giotto he discovered the foster mother of the art that followed in Italy. And so it is that to W. B. Richmond it has been given to initiate and to carry out the one great scheme of decoration England has for centuries attempted. Giotto, simplest of all men, was the beginner of the new Italian art which ended with Michael Angelo. The last echo of the voice of Giotto died away in the glorious vaults of the Sistine Chapel. What if our own Richmond is the modern Giotto, and our own glorious, noble Cathedral of St. Paul's the medium of his ambitions? Who said that at the birth of completeness the death knell of monumental art sounded? England has had no monumental art; but does it not now long for it? Why not nail

THE NEW ROMAN CATHOLIC CATHEDRAL.

THE preparation of the plans of the new Roman Catholic Cathedral, which is to be erected at Westminster, have been entrusted, as already announced, to Mr. J. H. Bentley. The style of architecture decided upon being the ancient Basilican, and no living architect in England having planned a Church in that style, it was decided that Mr. Bentley, before preparing his plans, should visit the Continent and inspect the Basilican Churches at Rome, Ravenna, and Florence. After an absence of several months, Mr. Bentley has returned to London, and now that Cardinal Vaughan is also back from Rome it is expected that the plan of the new Cathedral, of which the foundation-stone is to be laid on June 29th—the feast of St. Peter and St. Paul—will shortly take definite form. The site, a valuable freehold property of four and a half acres, on which once stood the Bridewell House of Correction, at Westminster, cost £55,000, and has since been valued at £300,000. In addition to the Cathedral there is to be built on the land a monastery large enough to accommodate thirty Benedictine monks and forty-five lay brethren, together with a Lecture Hall that will admit 2,000 people; while the Cathedral itself, which is to be 350 ft. long by 170 ft. wide, and inside 100 ft. high, will seat 8,000 and hold 10,000.

THE CARTOON OF CHRIST IN THE APSE OF ST. PAUL'S: W. B. RICHMOND, A.R.A.

the base insinuations of its callousness and spring Ambition into being? Painting has been picturesque, it may be monumental. Her ordered garments have gone in tatters; we will garb her anew. Her serious demeanour has changed for the flush of lawless liberty; but she is fretful and abashed; she longs at last for higher and for nobler things.

(To be continued.)

It is estimated that the construction of a road round the Scarborough Castle Hill would cost £70,000.

When these buildings are completed it is estimated that there will still be enough of the land left to yield, if let on building leases, sufficient funds to furnish an endowment for all the expenses connected with the Cathedral. The site, it may be added, is free from debt. Since Cardinal Manning's death the project has been pressed forward, and further substantial support has been received, a single subscriber giving nearly £20,000, and there is now enough money in hand or promised to justify the commencement of building operations, if not to complete the shell of the Cathedral.

"ARTS AND CRAFTS" AT MANCHESTER.

THERE is at present open in Manchester an "Arts and Crafts Exhibition" akin to what has been already held in London; but in addition there is a strong local reinforcement, and the dweller in Manchester who has the capacity to discern local talent worth encouraging and the means to encourage it will find it brought before him by this Exhibition as it has never been brought before. He will find, for instance, that the movement which is so strongly marked among the younger London architects for making the architect a

ANOTHER CARTOON IN THE APSE:
BY MR. RICHMOND, A.R.A.

designer and almost a craftsman as well as a master of "proportional lines" has taken stronger root in Manchester than he had thought, and that there is some excellent furniture in the Exhibition designed by young Manchester architects. He will also discover that at least one Manchester painter, in the person of Mr. F. W. Jackson, has had the sense to get away from the everlasting easel picture, and to paint a great decorative panel—almost as harmonious but less flat than a Puviss de Chavannes—of an old walled garden, which in the right kind of room would make a right noble and delectable frieze. He will also welcome the decisive bound to the front rank taken by so purely Lancashire an enterprise as "Pilkington's Tile and Pottery Company, Clifton, Manchester," whose tiles, whether designed by its artistic director, Mr. Joseph Burton, or by Mr. Leon Solon (the younger), Mr. John Chambers, or that always accomplished master, Mr. Lewis F. Day, are full of interest and charm. Another northern exhibit is that of the Luca della Robbia Company at Birkenhead. Yet it is true there is no Northern pottery to be compared to Mr. de Morgan's finest things, among which what may be called the "fish jar" in particular is a dream of strangeness and beauty. But then Mr. de Morgan is beyond question the first potter in Europe, without serious rival in either France or Germany. There are, too, the wonderful tapestries designed by Sir E. Burne-Jones and carried out by Mr. William Morris, among which the "Wise Men from the East," given to Manchester in memory of his mother by a donor who will be nameless, is the most beautiful and memorable. The mechanical methods of reproducing pictures, drawings, or photographs for book illustration are well illustrated, among them Mr. Crane's original designs for the menu of a well known restaurant, as well as the blocks

and impressions from them. The artist pleads in his preface to the catalogue for the union of "use and beauty in the surroundings of our daily lives," and this charmingly designed leaflet, printed in red on rough paper, shows that he can apply his theory with success to the commonest objects. Mr. Crane's designs to illustrate "The Two Gentlemen of Verona" and the "World's Fair" catalogue hang one above the other in the same room. The Birmingham Guild of Handicraft include in their interesting exhibit specimens of printing and wood engraving, and the art of printing, as it is understood by Mr. William Morris, is well illustrated by a complete set of the publications of the Kelmscott Press.

The Exhibition, which promises to be a pronounced success, will be continued well on into June.

PAINTERS IN WATER-COLOURS.

OPENING OF THE EXHIBITION YESTERDAY.

THE Royal Society of Painters in Water-colours opened its hundred and twenty-third summer exhibition yesterday, after a private view on Saturday. Various circumstances have conspired to prevent a considerable proportion of the members and associates from sending in any works, and, consequently, so far as regards the number of the drawings displayed this year, the exhibition falls short of some of its predecessors. There are, indeed, only 216 works, but in quality and interest they fully maintain the reputation of this old and somewhat exclusive society. There are drawings which show that the hands of the seniors have not lost their cunning. Mr. William Callow, for instance, contributes with a profusion indicative of great activity and vigour, despite his advancing years, and Mr. Birket Foster has several sketches, too. What is perhaps of even greater importance is the indication that the society includes in its membership younger men pushing to the front, well able to keep up its traditions, and to supply the places of those who are passing away. Mr. Thomas M. Rooke successfully attempts a daring and gorgeously-coloured imagination of the scene when Herodias danced before Herod; and of other compositions, "Bertuccio's Bride," by Edward R. Hughes, cannot but attract attention and elicit admiration. Mr. Herbert Marshall is up to date with scenes on the Thames when navigation was icebound by the late frost; while, on the contrary, Mr. A. W. Hunt's sketches of the Parthenon, by including the now happily demolished Italian tower, reveal that they must have been made some years ago. Mr. George Fripp's soft landscapes have a charm of their own, though many may prefer the larger brush and mistier lights of men like Mr. Eyre Walker. Mr. Albert Goodwin produces excellent effects—see his Lincoln, his Whitby, and his scene in Bristol Docks—with exceedingly simple material.

THE CAPE HOUSE OF MR. CECIL RHODES.

A THOUSAND acres on Table Mountain's charming slopes; a quaint old Cape Dutch residence stocked with all manner of interesting antique furniture and story-laden mementoes; an old garden filled with the odour of great beds of violets; a glen carpeted with hydrangeas in flower; a game preserve filled with South African antelopes and birds, with a lion-house for Zambesian forest kings; six miles of oak avenues, commanding vistas and views of sea and mountain gloriously picturesque wherever the eye ranges—all this, flooded with warmth and sunshine, under the cloudless blue by day and the moonlit sable by night! It is a fairly enticing picture which is given us by Cape Town accounts of Mr. Rhodes' residence. "Groote Schuur" is a typical old Cape Dutch house which Mr. Rhodes has

taken in hand with the lavish ideas and imaginative taste of a Monte Christo. He has bought up adjoining estates until he has a frontage of three miles of choicely wooded mountain side; and after enlarging the residence itself in correct style, has made it a perfect museum of old Cape Dutch furniture and curios, and relics from Mashonaland and Matabeleland, and many other places besides. A lover of the antique and a man who had not only taste and means but the power of seeing where he can specialise, Mr. Rhodes has spared no expense or trouble in procuring what is interesting and in character for the interior of his beautiful home. Dutch clocks, Dutch chairs and wardrobes, rich old tapestries, old prints and paintings, keep up the idea of "Groote Schuur" as a Cape Dutch residence; whilst of even greater interest are such relics as Lobengula's rifle, the silver elephant of Buluwayo, the Matabele King's seal and drinking cup, the sacred crocodile-bowl of Zimbabwe, bits of Arab glass from the ruins, blue pottery, and a Roman coin from Mashonaland, and photographs of the men who fell or who conquered in the late little war.

HISTORIC HOUSES TO BE LET.

WITH the approach of the London season there is a large increase in the number of interesting country houses to let. Two of the most historical in the market are Bisham Abbey, at Marlow, and Vale Royal, Lord Delamere's seat in Cheshire. The Abbey at Bisham was granted to the Templars in the reign of Stephen, converted into a priory in 1338 by the Earl of Salisbury, afterwards granted by Henry VIII. to Anne of Cleves, and later occupied by Elizabeth for three years prior to her accession to the throne. Vale Royal is part of the ancient convent to which additions were made by the Holcrofts. The great hall, 73 feet in length, is hung with armour and military weapons, and the windows contains the arms of several well-known Cheshire families. This house was honoured by a visit from Royalty, for the parish register contains the following entry: "A.D. 1617, the 21st day of August, the same day being Thursday, King James came to Vale Royal, and there kept his Court until Monday next after." Other houses for which tenants are being sought are Minster Acres, Northumberland; Dalham Hall, Newmarket; Pixton Park, West Somerset, which the Countess of Carnarvon vacates in June; Combermere Abbey, Viscount Combermere's fine place in Cheshire; and Hinton St. George, Earl Poulett's magnificent seat in Somerset. What is probably the first important sale of English landed Estate for the present year is the disposal to Mr. Ashley Dodd of the home portion of Colonel Leslie Toke's Godington Estate, near Ashford, in county of Kent. The estate has a distinctly defined pedigree from the time of the Conqueror, and in the interval has been in the hands of only four families, viz., the Godingtons, the Champneys, the Goldwells, and the Tokes.

The new stained-glass window which it is proposed to place in the parish Church of Billingborough, Lincolnshire, is estimated to cost about £250. It is intended to serve as a memorial to the late Duke of Clarence and Avondale, upon whom, had he lived, the right of presentation to the living, which now rests with the Queen, would have devolved.

ST. PETER'S CHURCH, Levenshulme, Manchester, is proposed to be furnished with an additional Mission Church. The proposed structure is for the Broom Lane portion of the parish, and efforts are to be made with a view of raising about £2,000, with which to defray the cost of erection and to liquidate a debt on the Mission Church of St. Mark.

THE WORK OF THE "GLASGOW SCHOOL."

FIVE years have elapsed since the work of the so-called "Glasgow School" of Painters, mustered in strength at the final Grosvenor Exhibition, challenged and secured the notice of the critics. Previous isolated specimens of it, seen on the walls of the New English Art Club and elsewhere, had excited passing interest and called forth comment, but it was only when Sir Coutts Lindsay made Glasgow Art the dominant feature of his last exhibition that the new movement forcibly arrested attention and established its claim to serious consideration. For occasional examples might have been and were passed over as mere ebullitions of more or less clever eccentricity, while this collective exhibition, by revealing the similarity of motive and common elements of strength that lurked behind the vigorous diversity of the Glasgow men, proved the possession of a distinct aim, and showed the movement (whatever its aim) to be a factor clearly demanding to be reckoned with in the contemporary development of British Art.

complex. The artists' own acknowledged preferences are for the work of the Barbizon School and that of the Dutch Romanticists, its offshoot, while amongst contemporaries the pre-eminent place of honour in their regard is given to Mr. Whistler. Precisely to what extent and in what manner the different members of the group have been influenced by these preferences is a subtle point of no great practical importance. In a broad sense the French romantic movement may be said to have given the impulse, while for the rest the particular suggestions afforded by the work of this master, and that, have doubtless been assimilated and adapted according to the natural bent of each artist's idiosyncrasy. The strongly marked individuality of each painter is not the least striking feature of the group, and it is this feature that makes the term "school" as applied to them inapplicable. For the Glasgow men have not created a school in the proper sense at all. They have certain ideals and working theories more or less in common, but beyond these the main bond of brotherhood is recognised in the common effort to attain the utmost freedom of expression. Such an aim,

"ON THE SUPPOSED SITE OF LONDON!"

A NOVELIST'S LITTLE JOKE.

AT the third annual meeting of the New Guinea Archæological Society, writes Dr. Conan Doyle, using his lively imagination to the uttermost, a paper was read upon recent researches on the supposed site of London, together with some observations upon hollow cylinders in use among the ancient Londoners. Several examples of these metallic cylinders or tubings were on exhibition in the hall, and were passed round for inspection among the audience. The learned lecturer prefaced his remarks by observing that on account of the enormous interval of time which separated them from the days when London was a flourishing city, it behoved them to be very guarded in any conclusion to which they might come as to the habits of the inhabitants. Recent research appeared to have satisfactorily established the fact that the date of the final fall of London was somewhat later than that of the erection of the Egyptian Pyramids. A large building had recently been unearthed near the

COTTAGE RESIDENCE, STAPLEFIELD, BY FRANK T. BAGGALLAY.

Since then the work of the "Glasgow School" has won recognition and distinguished honours on the Continent. Within the past twelve months, too, it has been made the subject of appreciative comment and exposition in several of the magazines. Perhaps a little of the laudation in the latter quarter might have been spared, for Glasgow Art, regarded as a whole, is yet in but a tentative stage, and is frequently disfigured by the faults and mistakes inseparable from experimental effort. But this much may safely be said, that no group of painters in our own time has given equal evidence of spontaneous vitality and the independence of attitude that springs therefrom—an independence, be it remarked, not always above the weakness of flouting conventionality for the sheer amusement of the thing,—and whether we regard the level of achievement already actually attained or the promise of future development contained in work so palpably inspired by honourable ideals, no "school" of recent origin has succeeded in making the same solid claim to the watchful and hopeful attention of connoisseurs. The circumstances and influences that have played a part in the evolution of the "Glasgow School" are manifold and

making for diversity rather than uniformity, is hardly the basis of a "school," although it may serve as a bond of affiliation. In noticing the work of the Glasgow men shown in the two principal Scottish exhibitions this year, priority of place may be given to the Royal Scottish Academy, not on the ground of the superior importance of the pictures it has secured, but because of the higher official status of that body—an official status which, unfortunately, it does not make much effort to justify. What distinction the Edinburgh exhibition enjoys is mainly due to the contributions from Glasgow, and this fact is officially recognised in the advantageous position accorded to most of the pictures sent from the West. Comparatively few of these pictures, however, are new, many of them having already seen the light of publicity in Glasgow—a circumstance worth mentioning incidentally, as showing the position the Scottish Academy really holds in the representation of Scottish Art. Although the contributions of the Glasgow men to the Royal Scottish Academy lack the interest that attaches to new works, they are yet, taken all in all, stronger and more representative than the examples to be seen this year in the Glasgow Institute.

dried-up bed of the River Thames, and there could be no question, from existing records, that this was the seat of the law-making council among the ancient Britons, or Anglicans, as they were sometimes called. Near this was an oblong building which had originally consisted of brick. Its name has been ascertained to be the Aquarium, which points to its having been used as a place of seclusion for habitual drunkards. The lecturer proceeded to point out that the bed of the Thames had been tunnelled under by a monarch named Brunel, who is supposed by some authorities to have succeeded Alfred the Great. The open spaces of London, he went on to remark, must have been far from safe, as the bones of lions, tigers, and other extinct forms of carnivora had been discovered in Regent's Park. Having briefly referred to the mysterious structures known as "pillar boxes," which are scattered thickly over the city, and which are either religious in their origin, or else may be taken as marking the tombs of Anglican chiefs, the lecturer passed on to the cylindrical piping.

REVISED plans have been prepared for a Hospital for the Clydebank and Renfrew Joint Hospital Board. The estimated cost is £7,000.

LIGHTHOUSES OF EUROPE AND AMERICA.

MR. EDWARD P. ADAMS, C.E., has written in *Cassier's Magazine* a series of illustrated papers on "Modern Lighthouse Service."

The oldest towers known, says the author, were built by the Lybians in Lower Egypt. They were temples also, and the light-keeper priests taught pilotage, hydrography, and navigation. The famous tower on the Isle of Pharos, at Alexandria, built about 285 B.C., is the first lighthouse of undoubted record. At Dover and Boulogne, on either side of the English Channel, were ancient lighthouses, built by the Romans. But the lighthouse at Coruña, Spain, built in the reign of Trajan, and reconstructed in 1634, is believed to be the oldest existing lighthouse. At the present time the lighthouse system of Western Europe leaves little to be desired. The new World has taken its lessons from the old, and welcomed commerce by its beacon lights.

The erection of Eddystone lighthouse at Plymouth, made a new era in the construction of such buildings. Bell Rock lighthouse, the next English lighthouse of a similar nature, is one hundred feet high, and was finished in 1810, at a cost of £60,000. The lighthouse on Sherryvore Rock, off the west coast of Scotland, which cost, with the harbour for the tender, £87,000, was first illuminated in 1844. Another of this nature is the lighthouse on Bishop Rock, off Scilly, one hundred and forty-five feet high, and cost £36,500. Wolf Rock lighthouse, off Land's End, Cornwall, is the latest great British work, and both in its structure and its illumination combines all the refined improvements. The foundation was commenced in March, 1862, and the lighthouse completed in July, 1869. In the first season only eighty-three hours of work could be done, and the whole time occupied in the building was equal to about one hundred and one working days. The cost was £62,725. The great distinction between the latter towers and their predecessors is that the stones of each course are dovetailed together laterally and vertically, so that the use of metal or wooden pins is needless. This method was first used at Hanois Rock, Guernsey.

On the coast of France many remarkable lighthouses have been built. At the present time, probably, the most complete system of lighthouses is possessed by that country. Cape de la Hève, near Havre, at the mouth of the Seine, is marked by two towers with lights of the first order. The first towers were constructed in 1777. The lighthouse of Walde is an example of a successful method used in sand or loose material. It is built upon screw piles, well braced, holding the lighthouse above the reach of the sea. This method was first used by Alexander Mitchell in the foundation of the English lighthouse on Maplin Sand at the mouth of the Thames. The lighthouse of Heaux de Bréhat was built about three miles from the most northerly end of Brittany on a partially submerged rock where the currents at times ran eight knots an hour. Still more difficult was the building of the foundation of the lighthouse of Ar-men, eight miles westward of the island of Sien, on the north-west coast of France. Commenced in 1867, it was not finished until 1881. At first the workmen, wearing life-belts, had to lay upon the rock "working with feverish activity, the waves constantly sweeping over them." This great work was planned by M. Leonce Reynaud, director of the lighthouse service of France.

One more European lighthouse well deserves mention, because it was the first lighthouse, erected at a long distance from land, which does not rest on a rock foundation. This lighthouse is Rothersand in the North Sea, Holland, near the mouth of the Weser. The history of its construction, which extended over seven years, from 1878 to 1885, of its first failure and final success, is exceedingly instructive. To build the foundation a caisson of boiler iron, thoroughly braced, was sunk in the sand to a depth of seventy-three feet below low water, then filled with concrete and masonry to about mean sea level. On this foundation was built a masonry tower with an iron shell, trumpet-shaped at the base, which is thirty-four feet

eight inches in diameter, and seventeen feet in diameter at the top, which is about one hundred feet above the water.

The early American colonists evidently saw the necessity for beacons to guide vessels to a safe anchorage. The first lighthouse in America was built at the entrance to Boston Harbour in 1715-16, at a cost of £2,285. Other colonies followed the example of Massachusetts. By Act of August 7th, 1789, the United States accepted possession of title to the lighthouses on the coast, and agreed to maintain them thereafter.

When these lights came into the possession of the United States, they were placed under the direction of the Secretary of the Treasury. As the result of investigation abroad and several reports to Congress, the Act of June 30th, 1852, was passed, by which the Lighthouse Board was organised as it now exists. In accordance with the provisions of this Act, the President appointed two officers of the navy of high rank, two engineer officers of the army, and two civilians of high scientific attainments, with an officer of the navy and an officer of the engineers of the army as secretaries, to constitute the United States Lighthouse Board. The board is attached to the office of the Secretary of the Treasury, who is its president, and under his superintendence it discharges all the administrative duties relating to the construction, illuminating, inspection, and superintendence of lighthouses, light-vessels, beacons, buoys, and other sea marks, the security of foundations of existing works, procuring illuminating and fog-signal apparatus, supplies and material of all kinds for building and rebuilding and keeping in repair buildings, vessels, and buoys of the United States. The members of the board receive no pay for their services, other than their regular pay in the army, navy or Civil Service. They, as well as all others in the lighthouse service, are prohibited from having any interests in any lighthouse contract.

ART AND SCIENCE AT RAMSGATE.

OPENING OF A LIBRARY AND TECHNICAL SCHOOL.

RAMSGATE is moving with the times, and has been vastly improved even during the last five years. That being so, let Ramsgate's programme have—in the very forefront—better railway stations, a better service of trains, and a town hall worthy of the name, says a spirited contributor to a daily contemporary. Meanwhile, a valued improvement has been added to Ramsgate in the institution of a free Public Library and Technical School. The Mayor and Corporation invited Mr. John Passmore Edwards down from London to formally open the building. Many things in Ramsgate are modest in character. The Town Hall is remarkably so; the market place which is beneath it, is in keeping. In like manner, the new Public Library and Technical Schools are unassuming in character. A large house which had been used as a school was secured and converted, plainly but without meanness, into rooms for readers of papers and magazines, a library for books, and class-rooms for the technical students. A green breadth of lawn at the back, and some little shrubbery are part and parcel of the new privileges which the public will from this day enjoy in Ramsgate. The history of the scheme is soon told. Ramsgate, in 1891, received a grant of £447 from the County Council as its share of the money voted to various urban authorities in Kent; technical classes were formed, and met in the Town Hall. The accommodation proving too small, rooms elsewhere were found. About six months ago, however, the house now secured was taken, and converted into the comfortable and creditable institution now open. The technical classes began with 140 students; there are now 350, and the art class has been especially successful.

ESTIMATES were submitted at the last meeting of the Dunfermline School Board for the erection of a School in the north-western part of the city, according to plans by Mr. Andrew Scobie, architect. The total cost was stated at £8,300.

A TRINITY HOUSE FIASCO.

OFFICIALS FUNK THE FASTNET.

SOME time since it was reported to the Irish Lighthouse Authorities that the stability of the Fastnet Lighthouse left a good deal to be desired. They, after making inquiry, brought the subject to the notice of the Board of Trade, and recommended that something should be done. The "something" involved an expenditure of £75,000. The suggestion was, as a matter of fact, pooh-poohed by the Board of Trade. Upon this the Irish Board of Lights hastened to declare that they ridded themselves of all responsibility in the matter. This attitude of theirs alarmed the Board of Trade, which now requested the Trinity House to investigate the condition of the Fastnet. As a result Mr. Matthews, the Engineer of the Trinity House, accompanied by Sir Leopold M'Clintock and Captain Vivian, went over to Ireland, and proceeded to the Fastnet in a steam yacht, accompanied by Mr. William Douglass, of the Irish Board of Lights. The Fastnet rises a hundred and eighty feet out of the sea. The Irish engineer, nothing daunted, landed on the Fastnet, and then looked to see his companions follow. It was a case with them, however. Mr. Matthews, the Trinity House engineer, and his two companions looked at the Fastnet and at the surf which beat about its feet, and liked not the prospect. So Mr. William Douglass, of the Irish Board of Lights, finding his patience exhausted, had himself slung back into the boat again. Then the whole party returned to the steam yacht, and afterwards went shorewards for safe shelter. Again, on the following day, they returned to the rock, but this time the Irish engineer declined to set an example of very ordinary courage, and his companions were not in a position to make any drafts upon their own supply. Consequently they once more came back into safe harbourage, and with the fixed determination not to attack the grim Fastnet again.

THE question of the erection of a Mortuary at Ilford, is under the consideration of the Urban District Council, which has also decided that plans and estimates be got out for building an Infectious Diseases Hospital on land in Cat's Lane.

THE work of constructing the Thorncliffe Tunnel on the new Midland Railway from Sheffield to Barnsley has had an abrupt stoppage. Through some cause Mr. Hallam, sub-contractor, has thrown up his contract, and the whole of the workmen in his employ have been paid off, and are thus thrown out of employment. Steps are being taken to secure an early resumption of work, and it is hoped this will be the case.

PUBLIC opinion in Edinburgh is strongly in favour of immediate steps being taken by the municipality to erect a statue of the late Professor Blackie, and it is anticipated that at an early date the details respecting the proposed memorial will be arranged at a meeting of the Town Council.

THE Irish military authorities have for some time past been contemplating the erection of a large barracks in Tullamore, capable of affording accommodation to two battalions of infantry. It is stated that the project has been decided upon, and that the necessary negotiations will be begun immediately.

THE ceremony of laying the foundation stones of the Primitive Methodist Chapel at Brownhills, Yorkshire, took place last week. The new Chapel will seat 565 worshippers, and the cost will be £1,200.

THE School Board recently invited six firms of architects practising in Bradford and Leeds to submit designs in competition for the proposed Schools at Highfield, Tong. The designs of Messrs. W. & J. B. Bailey, of Bradford and Keighley, have been selected.

THE Building Committee of the Bridgnorth and South Shropshire Infirmary has decided to accept the tender of Mr. R. Merton Hughes, contractor, Birmingham, for the sum of £4,368, for the erection of the new Infirmary, and operations have been commenced, in order to have the foundation stone laid on the 24th inst.

THE EARLY BUILDERS OF WHITEHALL.

A CONTROVERSY has sprung up with reference to what might almost be described as the pre-historic existence of a palace at Whitehall. Alluding to Mr. Loftie's historical description published in the April "Portfolio," Mr. Hurd, of Bristol, writes respecting the purchase of the district of Whitehall from a certain Roger de Ware and Maud, his mother, by Hubert de Burgh, between 1227 and 1243—this being the earliest date given by Mr. Loftie, of Whitehall. There is, he says, an earlier mention of it in the "History of Principality of Wales," by R. B., 1695. "About the year 800, Howel-Dha, Prince of Wales, built a palace for his own residence of white hurdles, or wattles, and therefore called White House or White Hall, if you please." Now this Howel-Dha was born 788, was made Bishop of Sales-brigg (Old Sarum) 824, Bishop of London 840, Bishop of Canterbury 844, and retired to Sarum, and became a monk, dying in 870, aged eighty-two. There is no record of whose son he was, but he may have been the son of the King of Powys, who was driven by Offa from his capital Pengwynn, the name being changed by Offa to Scrobs-byrggy (Shrewsbury) about, or rather after, 779. As Powys then owned by tribute to Offa the supremacy of Mercia, his son may have kept the title Prince of Wales, and was probably educated in London and built White Hall when a youth of eighteen or twenty. A few years after Offa's death, under his successor Ceuwulf, he seems to have claimed the title of King of Britain; and after Ceuwulf's death he became Bishop of Sarum, during the civil war in Beornwulf's reign. And when the latter was slain in battle in Wiltshire, Howel seems to have submitted to Egbert, and later on assisted him to repel the terrible invasions of the Northmen, the "Vikings," who came southwards up the Thames. This may have caused Howel to return to White Hall, his wattled palace, as a place for defence, and the Archbishop of Canterbury as well as the Cathedral being burned by the Vikings, Howel marched there, conquered them, rebuilt the Cathedral, and became Archbishop, till in his old age he returned to die in a monk's cell at Sarum. This Howel is often mixed up with Howel the Lawgiver of Abury, born 880, King of Abury 914, died of fever 940. The Welsh claim both these Howels, though they probably never set foot in Wales (unless Howel-Dha was born there). There is an allusion to Howel the Lawgiver of Abury in a small Welsh quarto in the British Museum, with an English translation. "Howel, the good King of Wales, a certain case extracte out of the ancient laws of Howel-Dha, King in the year nine hundred and fourteen" (There was no supremacy of the Welsh in Wales. At Abury he may have claimed his title). Can the name of Roger de Ware be derived from "D-ha"? If so, this Maud and Roger may have been relations of Howel-Dha, and the possession of Whitehall may have been kept in the family from the time of its erection.

Upon this, Mr. Phillips, C.E., of Putney, writes: "My attention has been called to Mr. Hurd's letter, quoting from a 'History of Principality of Wales,' by R.B., 1695, that 'about the year 800, Hoel-Dha, Prince of Wales, built a palace for his own residence of white hurdles, or wattles, and therefore called White House or Whitehall.' This palace is supposed to have been built where York House (called Whitehall), Westminster, formerly stood. There must be a mistake as to the site of the Whitehall in the quotation. If it was on Westminster Island at all in the year 800, it must have either been on the plateau of Thorney, Tothill, or the Neyt, as the remainder of the Island, until the year 965, was drowned every high water. Up to this date the area between Charing and the Mall in St. James's Park on the north, and Thorney and Tothill on the south, was a shallow lake, called Merfleet, at half-tide level; and where Whitehall and Privy-gardens are now, was a wide sand-bank from Merfleet effluent (near Charing) up the Thames along Merfleet to Thorney two feet above half-tide level, or about six feet below high water of spring tides. It is evident, therefore, that the palace could not have been

at Whitehall, Westminster, in the year 800, as stated, except, as I have said, it was on one of the plateaus. The low flat district now covered by Westminster and South Pimlico was originally an alluvial island, triangular in shape, and one square mile in area. During the decade from 960 to 970 it was embanked above high water from Charing to Chelsea, and the internal areas—Bulinga Fen and Merfleet—were drained through the embankment and converted into rich meadows. Then it was Merfleet, and the sandbanks there were filled up, nearly to the present levels, with two and a half million cubic yards of earth, excavated in forming the present plateau from Charing to the Green Park from east to west, and from the foot of the slope down from Piccadilly to the Mall in St. James's Park from north to south. After this was done the Thames frontage from Charing to Thorney, where Scotland Yard, Whitehall, and Privy Gardens are now, was occupied and built upon. The engineer who planned this great work was Archbishop Dunstan, and his engineer-assistants who superintended its execution were twelve engineer monks from Glastonbury."

Mr. Lloyd James writes from March: "I find in the letter of L. E. Hurd, a reference to Hoel-Dha (should be Howell-Dha) i.e., Howell the Good, and the probability of his having been educated in London, and of having built White Hall. It seems to me that the writer has confused the White Hall in London with another place. Howell the Good was son of Cadell ab Rhodri Mawr, i.e., of Cadell, the son of Rhodri the Great, and on the death of his father Howell, came into possession of South Wales and Powys 907; and became king of all Wales in 940, until his death in 948. He gathered a number of those well-versed in the ancient laws of Wales, at White House, now called Whiteland, a rising little place, and a station on the Great Western Railway, some 14 miles below Caermarthen, South Wales. He had this White House-on-the-Tave built as his residence, and here, as history records, he had the ancient laws classified, codified and made uniform. The names of those who assisted him are matters of history. There stands to this day a farmhouse called the White House, and, as said, on the very site of the one erected by Howell the Good. Howell-Dha having become a Bishop, is news to me, who have read most authorities on the history of Wales and Welshmen, both cleric and lay. Some Howell may have been Bishop of London for anything I know, but not Howell-Dha."

SAWDUST.

THE Foundation-stone of the New Primitive Methodist Chapel, at Brownhill, Yorks, was laid last week. The cost of the building will be £1,200.

It is stated that the Prince of Wales has consented to lay the Foundation-stone, in June next, of the new buildings to be erected by the Royal Medical Benevolent College.

THE re-opening of the Choir of the Bristol Cathedral, after a thorough restoration, under the direction of Mr. J. L. Pearson, R.A., is to be celebrated on May 5th.

A FIRE broke out in the timber yard of Harland & Woolff, shipbuilders, Belfast, on Tuesday night. The damage to the timber is estimated at £20,000.

MESSRS. J. WALDRAM & SON, of Buckingham Street, Adelphi, are the architects for the western block of the Workhouse in Poland Street, W., which is about to be rebuilt.

MR. STEVENSON CONSTABLE, M.A.I.A., a New York architect, has been appointed Superintendent of Buildings to the Town Council of New York, in succession to Mr. Brady, "removed."

FROM the designs of Mr. J. Mitchell Bottomley, of Leeds and Middlesbrough, All Saints' Church Schools, Pontefract, near Leeds, are about to be remodelled, and an Infants' School will be added.

THE Celtic Cross, which has been placed in the Church Cemetery at Bideford, over the grave of Mrs. C. C. Smith, is of Ballinasloe limestone, and was designed by Sir Arthur W. Blomfield, A.R.A.

THE foundations are being excavated in Winlatonbank, Blaydon-on-Tyne, for a new Roman Catholic School, to which a Chapel will hereafter be added. Mr. T. C. Nicholson, of Blaydon, is the Architect.

A Reuter telegram from Madrid, says:—According to intelligence received here from the Philippine Islands, the town of Tay Tay has been destroyed by fire. Two thousand houses were burned. One person was killed.

THE Annan Academy, Annan, is being warmed and ventilated by means of Shorland's patent Manchester grates and patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE new peal of tubular bells, which has been placed in the belfry of St. James's Church, Ashworth, near Heywood, at a cost of £150, was dedicated on Sunday last. The major portion of the cost has been defrayed by subscription.

SIR FRANCIS SHARPE POWELL, M.P., has formally opened and handed over to the borough of Wigan a boys' Reading Room in connection with the Free Library, which he has erected at his own expense, at a total cost for building and equipment of £3,600.

THE Embankment on the Bourne and Saxby branch of the Midland Railway has subsided several feet near to Wymondham, letting in a portion of the lofty bridge which spans the line at this place. Steps have been taken to prevent the collapse of the structure, but a portion of it will have to be rebuilt.

WHILE Sir Charles Dalrymple, M.P., was performing the ceremony of laying the Foundation-stone of the Parish Church, at Arbroath, a scaffold gave way and fell upon several persons. Great alarm prevailed, but fortunately no serious injuries were sustained. The ceremony was afterwards proceeded with.

HAVING viewed various sites for a generating station, the Electric Lighting Committee recommend the Hammersmith Vestry to treat for the purchase of two pieces of land abutting upon Fulham Palace Road, known as the Gardens Estate, belonging to Miss Yeldham and the Latymer Foundation, for the sum of £7,000.

A WELL-KNOWN Hackney landmark, Clapton Pond, is to be filled up and used for building purposes. The residents of Clapton have sent memorials to the local vestry declaring that "the destruction of the pond will depreciate the interest attached to this part of the parish of Hackney," and asking the Vestry to induce the freeholder to "make over this centre of local interest to the public."

ACCORDING to M. Akinfiel, the region of the Caucasus is drying up through the recession of the Caspian Sea, leaving bare tracts of sand, which the wind carries over the more fertile plains. During the last hundred years nearly 7,000 square miles of shore have been laid bare in this way. Owing to the movement of the sand it has been found necessary to protect the railway from Rostoff to Vladicavkaz by screens.

THE new Primitive Methodist Chapel, which has been erected at Masborough, Rotherham, was formally opened last week. The site is part of the old Independent College grounds, and situate in a densely populated neighbourhood. The new Chapel has cost about £2,300. It is built of brick, with stone dressings, and the roof is covered with Welsh slates. The design is English Renaissance, and the architects are Mr. Thomas Howdill and Mr. Charles B. Howdill, A.R.I.B.A., of Leeds.

NEW Baths have been built at Ilford, close to the River Roden, and near the high road, west of Barking Lane. The swimming bath is 60 feet long and 20 feet wide, with a varying depth of six feet to three feet. The bath is self-supplied from a spring underneath, which, it is estimated, will save £60 per year. There are dressing apartments for the accommodation of 39 persons, and a gallery for the use of spectators. The boiler is fed by a Penberthy injector from a well outside, and is supplied by the Rainbow Engineering Company. The building itself is of plain, substantial brick. There are also two cottages for the residential staff.

THE CRISIS IN THE BUILDING TRADE.

A POSSIBILITY OF SETTLEMENT.

IT is stated that there is reason to hope that better counsels will prevail between the masters and the employed in the building trade, and that a strike or lock-out will be averted. The masters are not unanimous in favour of the engagement of 1892, although there is no doubt a strong minority of them who would prefer a lock-out. On the other hand the employees, numbering upwards of 30,000, although well organised, have already suffered severely through the protracted winter and frost, and their levies have often been paid with considerable trouble. The great bone of contention is as to the proposal of the employers that piecework and sub-letting shall again be substituted. It is confidently expected that the Masters' Association will meet the men's delegates at a general conference before May 1. The Operative Bricklayers' Society has completed its ballot. It shows a large majority against accepting the new conditions of the employers, and in favour of maintaining the old working rules agreed upon in 1892.

A meeting of the delegates of the London Building Trades' Federation has also been held at the Bricklayers' Hall, London, to discuss the approaching termination of the Working Rules. The meeting sat for nearly seven hours, but the result of its deliberations was not made public, and the officials of the Federation refused to give any information, stating that the meeting decided that the proceedings were to be kept private. Other sources state, however, that the meeting decided unanimously to stand by the agreement of 1892, and that each union connected with the Federation should communicate this decision to the Central Association of Master Builders. The members of the London Building Trade Unions hold that no alteration whatever in the agreement should be submitted to. There is no intention to enter upon a general strike in London to secure the enforcement of the agreement, and master builders who continue to observe the agreement will be assisted by the Federation. The unions have been paying levies for the last six months. The following is a list of the constituent bodies of the London Building Trades' Federation, together with the number of their members who are in the London district and are affected by the present rules. The numbers are those at the close of the past year, but since then some of the unions have received accessions:—

Operative Bricklayers' Society	6,300
Amalgamated Society Carpenters and Joiners.....	6,000
General Union Carpenters and Joiners	3,100
Perseverance Society Carpenters and Joiners	550
Associated Carpenters and Joiners	473
National Association Operative Plasterers	2,750
Metropolitan Society Operative Plasterers	420
Amalgamated Society House Decorators and Painters	2,200
London and Counties Painters and Decorators	400
Affiliated Societies House Decorators and Painters	1,062
United Operative Plumbers' Association	1,012
Amalgamated Wood-cutting Machinists' Society	204
General Smiths', Fitters', &c., Trade Union	250
Window Sash Glaziers' Trade Union	80
Lathrenders' Trade Union	90
Building Trades Section, Electrical Trade Union	100
United Builders' Labourers Union	3,750
Navvies', Bricklayers' Labourers, and General Labourers' Union	3,500
General Labourers' Amalgamated Union	3,000
Building Trades Section, Gas Workers' and General Labourers' Union	1,500
United Orders of General Labourers	1,000
Building Trade Section, London and Counties Labour League.....	325
Amalgamated Plumbers' Mates' Society	500
	38,566

The Central Association of Master Builders has not yet decided what action it will take

on May 1 next. There is a strong minority in the Association in favour of locking out the union men, in order to secure the acceptance of the two new rules, providing for piece work and the abolition of disabilities, but whether this course will be taken is not yet decided.

The men demand the insertion of the following conditions as a preamble to the working rules:—(1) That no workman shall be placed under any disability by reason of being, or not being, a member of a Trade Society. (2) That no objection shall be raised to sub-letting work, provided these rules are observed. The federated unions are now voting upon the following questions:—(1) Are you in favour of accepting the above rules as additions to the present working rules? (2) Are you determined to stand by the working rules as agreed to in 1892?

MEETING OF LEEDS MASTER BUILDERS.

As the six months' notice from the operative carpenters and joiners of Leeds and District for an advance of wages expires with the present month, steps are being taken to bring about, if possible, conciliation. It will be remembered that at the beginning of November last, the Leeds Master Builders' Association received six months' notice from the carpenters and joiners of Leeds and District for an advance of wages from 8d. to 9d. per hour; also for various alterations of the working rules, to take effect at the beginning of May. On receiving this notice, the masters gave it due consideration, and came to the conclusion that the demand was exorbitant considering the state of trade. They therefore, in self-defence, sent a counter notice to the men to reduce wages from 8d. to 7½d. per hour, and to make alterations of minor points in the rules. It is stated that, although trade was bad, the masters would not have suggested any reduction had the men not made their demand at such a time. On Thursday afternoon a meeting of the Leeds Master Builders' Association was held in the Exchange Buildings for the purpose of considering what would be the most advisable course to adopt in view of the expiration of the notices on both sides. The meeting was attended by many of the largest employers, and after reviewing the situation they resolved to put themselves in communication with the men in order that a conference might be arranged, and, if possible, matters amicably settled. Unless this is done, it is to be feared that a strike is inevitable, and that nearly 1,000 carpenters and joiners will be directly affected, and a much larger number of those employed in other branches of the building trade, thrown out of work.

A SCHEME has been drawn up for the establishment of a County Museum for Lincolnshire. The sections suggested are geology, vertebrate zoology, entomology, conchology, botany, and the progress of man from the stone ages to the present time, and that there should be a library to illustrate the history, topography, and natural history of the county, with all the works of Lincolnshire men. To carry out such a scheme £25,000 would be required—£5,000 for the building and appliances and £20,000 for the endowment fund.

WHILE some workmen were engaged in levelling the flooring of Carey's Royal Cycle Riding School, 81, Euston road, London, they came upon a round tin box, buried under the boards of the riding circus, containing a large number of gold and silver coins, of the reign of Queen Elizabeth, and in a fine state of preservation. The find, it is understood, is valued at a large sum of money.

THE Edinburgh Corporation, at a cost of considerably over £100,000, has partially lighted the city with electricity. On the advice of Professor Kennedy (London), who acted as consulting engineer, two systems have been adopted, a low tension for streets and buildings adjacent to the station, and a high tension for the outlying districts of the city.

It is proposed to build a new Infant School in connection with the Presbyterian Church at Whalley Range at a cost of £1,500.

THE Board of Guardians intend to erect children's homes at Rothwell Haigh, Hunslet, at a cost of £7,000.

ARCHITECTURAL IRONWORK.

CHAPTER VIII.—IRON IN ROOFS.

IN treating now of ironwork as applied to the purposes of construction in roofs, it may be mentioned that it is in quite modern times that iron has been found to be a very serviceable material for the construction of roof-trusses for certain purposes. In speaking of the arrangements of the various parts and the stresses involved, it is necessary to first allude to the general principles observed in roof-trusses of wood.

The earliest dwellings, being constructed by men living in the warm dry climate of Central and Western Asia, had perfectly flat roofs. These were formed sufficiently secure to ward off the sun's rays and an occasional shower, and served as a resort during the cooler hours of the day, much as is the case in the East in the present day, but the climate of Europe requires inclined roofs, the better to resist heavy rains and snow, and the further westward in Europe we observe buildings, the greater shall we find the inclination, or "pitch" of the roofs.

The most simple plan of roofing an ordinary rectangular structure is to place stout rafters in pairs, with one end resting on the tops of opposite walls, and the upper extremities abutting at the top, or "ridge," to use the technical term. In such a roof as this, however, the covering, whether of tiles, slates, or whatever else may be employed, presses heavily upon the rafters, causing an inclination for their lower extremities to expand outwardly and push down the upper portions of the walls. In order to neutralise, or, at least, lessen this tendency, technically known as thrust, it is customary to connect the lower ends of each pair of rafters by means of a stout wooden member called a "tie-beam." Improvement in the framing of roof-trusses led to the addition of some other members, until finally we have a complete truss, or what is termed a "king post roof"—a very common form of English Architectural Woodwork. Coming now to the use of iron in timber roofs, as is well known in some roof-trusses iron is combined with wood, by which means far greater lightness is attained than when wood only is employed. An iron tie-rod, for example, may very advantageously replace the wooden tie-beam of which we have spoken. By screwing up the nuts the straining pieces are forced upwards, and being perpendicular to the principal rafters, they give support to them at their middle joints. When the tension rods are tightened, the tie-rod is also strained, and perfect stiffness is thus attained. The principals meet at the ridge, and the tension rods pass through them. The apex is covered by an iron plate, which is bent downwards so as to form a base for the nuts, which must be at right angles to the tension rods. The nuts are double in order to cause them to act upon a greater length of the rod than single ones would do.

(To be continued.)

THE Local Government Board of Mansfield has sanctioned the erection of vagrant wards at the Workhouse, the cost not to exceed £2,500.

THE Wesleyan Chapel in Charles street, Cardiff, was entirely destroyed by fire last week. The Chapel was the principal place of worship in the circuit, and accommodated nearly 1,000 persons.

PUBLIC offices are to be erected at Hunstanton on a site near the Golden Lion. Plans by Messrs. Skipper, architects of Norwich, have been accepted.

THE embankment on the Bourne and Saxby branch of the Midland Railway has subsided several feet near to Wymondham, letting in a portion of the lofty bridge which spans the line at this place. Steps have been taken to prevent the collapse of the structure, but a portion of it will have to be rebuilt.

THE ancient sallyport at Windsor Castle, which was discovered underneath Thames Street about forty years ago, is being connected with the Curfew Tower. The subterranean passage, whose finely pointed archwork and broad steps are composed of smoothly-chiselled chalk blocks, passes down inside the Castle wall and under Thames Street and the houses on the western side of the thoroughfare, in the direction of the river.

Trade and Commerce.

We shall be glad to receive copies of catalogues from firms engaged in the allied building trades. These will be carefully looked through, any novelty noted, and—should its nature seem to demand it—fuller attention drawn thereto. We are particularly wishful to secure the friendly interest of designers and artificers in *THE BUILDERS' JOURNAL*, and, now and then, we might see our way to reproduce an outline sketch or illustration of any contrivance that struck us as being new or needed. Building covers up—figuratively, and in fact—so much ground, and we mean to cover the whole of it.

We should be further obliged if firms would indicate, by some suitable mark, the pages in their catalogues to which they would in particular, desire to call our attention.

Housing under the Guinness Trust.—The annual report of the Guinness Trust for 1894 states that the capital as regards London now amounts to £260,642. The original sum given by the founder, Lord Iveagh, was £200,000, to which has been added £25,000 granted by the Goldsmiths' Company in 1893, and £35,642 net income from rents and investments. The buildings now contain 146 tenements on the Lever Street site, and 316 tenements in Vauxhall Square, which were opened at Midsummer. On Dec. 31, 1894, there were 5,135 persons living in the buildings held under the trust. The buildings now in course of erection on the Vauxhall Square site and also those in Page's Walk will be ready for occupation during the present year, and when these are completed the trustees will have provided 1,879 separate dwellings containing 3,746 rooms besides laundries, coster sheds, &c. With respect to the Dublin fund, which now amounts to £57,415, the sum of £7,415 arising from rents and investments has been added to Lord Iveagh's original donation of £50,000. The buildings on the Kevin Street site, which are similar in construction to those erected in London, were completed in January last, and they are now all fully let.

The Lighting of Edinburgh.—The Edinburgh Corporation, at a cost of considerably over £115,000, have partially lighted the city with electricity. The current was formally switched on last week by Lord Provost M'Donald's wife, and Prince's Street and adjoining thoroughfares became illuminated. On the advice of Professor Alexander B. W. Kennedy, of London, the consulting engineer, two systems have been adopted, a low tension for streets and buildings adjacent to the station, and a high tension for the outlying districts of the city. The central station has cost £18,000, exclusive of site and machinery, and has been erected under the supervision of Mr. Cooper, the burgh engineer. Mr. Monkhouse is the resident electrical engineer.

Brickmakers' Strike in Vienna.—They do things on a fine scale on the Continent. The brickmakers and tilers of Vienna, numbering between four and five thousand, went on strike on Wednesday morning for an advance of 50 per cent. in wages. The offer of the Kilns to raise the price of piecwork from 15 to 30 per cent. was refused. This time last year a strike in the same trade resulted in an advance of 20 per cent., and subsequently an additional 5 per cent. The weekly wages of the brickmakers amount now to from 30s. to 36s. sterling, besides free dwellings in the houses belonging to the company.

Beaton's Pocket Guide.—A dainty little booklet with limp leather covers and gilt edges, "Beaton's Pocket Technical Guide, Measurer and Estimator for the Building Trades" reaches us, and is just one of those invaluable little things that is always in the waistcoat pocket of men who build. The little guide consists of 200 pages, but there is no price attached. We wonder if Messrs. Crosby Lockwood, the publishers, give them away?

The Grand Jury of the county of Meath will shortly be petitioned on the subject of erecting a new Court House in the town of Navan.

SOCIETY MEETINGS.

Edinburgh Architectural Association.

—About 50 members of the association recently visited George Heriot's Hospital School under the leadership of Mr. Donald A. Gow, who pointed out its architectural features. The visitors afterwards proceeded to the Royal Hospital for Sick Children, in course of construction at Rillbank, where they were met by the architect, Mr. G. Washington Browne, A.R.S.A. Describing the plans of the hospital, Mr. Browne stated that the wards ran from east to west in order that they might have as much light and sun as possible. There were four large wards, each with 24 beds; one spare ward, and small wards for observation and isolation, providing in all for about 120 patients. The nursing staff was larger in a children's hospital than in one for adults, and there it would consist of five sisters, 21 day nurses, and eight night nurses. With resident doctors, matrons, &c., there would be a medical and nursing staff of 40. He described the accommodation for these, pointed out as a new feature in such buildings a play alcove for convalescent children, stated that the kitchen was on the top of the house, and that for 12 domestics who would be required there was a servants' hall. The cooking had to be done principally by gas. All through the building the ventilation had to be by natural and not mechanical means, and the heating in four sections, by low-pressure hot water in coils and pipes. The artificial light was to be electric, and for that they were laying down their own plant, with two boilers, engines, and dynamos. Either engine might be driven by either boiler, so that they were safeguarded from a breakdown of the light. After about half-past 10 o'clock at night the light would come from accumulators, so that there would be no machinery going at night. In any case the machinery was away from the building. There would be 404 lamps of 16 and eight candle-power. They were also laying down their own steam laundry in Sylvan Place. He explained the water supply, the materials used in the floors and walls, and other matters. In afterwards showing, on the various floors, how the plans had been realised, he drew attention to the absence of ornamental plaster work, and remarked that the hospital was constructed in a purely utilitarian spirit. The premises will be ready for occupation in August.

London and Middlesex Archæological Society.

—A meeting of this Society was recently held at the London Institute, Finsbury Circus. Mr. J. G. Waller, F.S.A., presided, and the Rev. Canon Benham, B.D., Rector of St. Edmund the King and Martyr, gave an address on "The Ancient Memorials of his Parish," in which he stated that the parishes of St. Edmund the King and St. Nicholas Acons formerly had two Churches, but both were destroyed in the Great Fire of 1666; that of St. Edmund's only was rebuilt, and since then the two parishes had run together. Mr. Herbert Jones, F.S.A., next read a paper on "Roman Remains recently found in Threadneedle Street."

Nottingham Architectural Society.

—At the twenty-second annual meeting of this Society, Mr. A. N. Bromley, F.R.I.B.A., occupied the chair. The council reported as to the business transacted in the year, and a statement of accounts was read. A ballot was taken for the election of president, vice-president, council, auditors, and secretary, when the following were elected:—Mr. John Howitt, F.R.I.B.A., president; Mr. A. N. Bromley, F.R.I.B.A., vice-president. Council: Mr. A. R. Calvert, Mr. A. H. Goodall, Mr. W. D. Pratt, Mr. H. Walker, F.R.I.B.A., and Mr. F. B. Lewis, A.R.I.B.A. Auditors: Mr. A. W. Brewitt, F.R.I.B.A., and Mr. John Sander, Hon. secretary and treasurer; Mr. A. Ernest Heazell.

Civil and Mechanical Engineers' Society.

—Mr. H. Coward read a paper on "Laundry Machinery" at the ordinary meeting of this Society, which was held on the 10th inst. The following members took part in the discussion which followed:—Mr. C. T. Walrond, A.M.Inst.C.E., the Honorary Secretary, Mr. E. H. G. Brewster, A.M.Inst.C.E., M.I.M.E., &c., Mr. E. Taylor, Mr. A. W. Ackermann, A.M.Inst.C.E., Mr. R. E. Phillips, A.M.Inst.C.E.,

A NEW Masonic Temple, erected and furnished by the Worshipful Master, Sir William Abdy, at a cost of £4,000, was recently opened and dedicated at Kelvedon, Essex, by the Earl of Warwick, Past Grand Master, assisted by Brother F. A. Philbrick, Q.C., and the Grand Officers of the province.

MR. J. WM. TROUNSON, F.R.S.B.A., F.S.I., Penzance, has been instructed to prepare plans for the alterations at, and additions to, the Penzance Wesleyan School Buildings. About £600 is proposed to be laid out in these buildings to meet the requirements of the Educational Department.

THIS evening Professor George Forbes, F.R.S., will deliver the first of a Course of Three Lectures at the Royal Institution on "Alternating and Interrupted Electric Currents." On Thursday, April 25, Professor Dewar, Fullerton Professor of Chemistry R. I., will begin a course of Four Lectures on "The Liquefaction of Gases," and on April 27, Mr. Arnold Dolmetsch will begin a course of Three Lectures on "Music and Musical Instruments of the Sixteenth, Seventeenth and Eighteenth Centuries" (with illustrations upon original instruments). The Friday Evening Meetings will be resumed on April 26, when Dr. John Hopkinson will deliver a lecture on "The Effects of Electric Currents in Iron on its Magnetisation."

The Builders' Journal

COMPETITIONS.

No. 2.—A Village Club House.

The Proprietors of the BUILDERS' JOURNAL invite drawings, in competition, from those under twenty-six years of age, for a Village Club House, on a corner site, 150 feet by 40 feet. The Club to contain a general room with a dais for the villagers, a reading room and library, a bowling alley, service bar, tea room, committee room, housekeeper's apartments, and three cubicles for public use. The necessary outbuildings must be provided. Cost not to exceed £2,000. Drawings to be delivered at Talbot House, Arundel Street, Strand, not later than Monday, the 6th May, 1895.

RULES.

- 1.—There must not be more than three separate sheets of drawings submitted by any competitor in any single competition.
- 2.—The scale must be a uniform one of 8 feet to the inch for plans, elevations, and sections. Detail drawings must be to half-inch scale, and a perspective in ink may be included.
- 3.—All drawings must be inked in, and be without colour or wash.
- 4.—Drawings in each competition must be sent in on the date specified, and must be submitted under a motto, accompanied by the name and address of each competitor in a sealed envelope.
- 5.—All competitors must be under the age of twenty-six.
- 6.—A public exhibition of the premiated designs will be held. The result of each monthly award will be announced in our columns and the assessors' reports will be published in full. The Drawings will remain the property of their authors, but we shall reserve the right to reproduce any we think fit.

THE AWARDS.

- 1.—A Gold Medal and a Cheque for £10 10s., to the competitor who submits the best half-dozen sets of drawings during the session of twelve months.
- 2.—A Silver Medal and a Cheque for £3 3s., to the competitor who submits the best single set of drawings during the session.
- 3.—Certificates signed by the Assessor and countersigned by THE BUILDERS' JOURNAL, will be awarded to the authors of the premiated designs in each competition, who will each receive a cheque for half-a-guinea for out of pocket expenses.
- 4.—At the end of the session the whole of the premiated designs will be submitted to a committee composed of the monthly assessors, and the Gold and Silver Medals and cheques will be awarded by them.

ANNOUNCEMENTS.

Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Saturday morning to ensure its treatment in the current issue.

Publishing.

The terms for free post Subscription to any part of the United Kingdom is SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments.

Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.

Per line, Sixpence. Minimum charge, Eighteenpence. Three Insertions for the price of Two.

Prepayment in the above Advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements.

Prices on application.

Small Advertisements for current week's issue are received up to first post Monday morning inclusive.

Editorial and Publishing Offices:

Talbot House, Arundel Street,
Strand, W.C.

THE Secretary of State for Foreign Affairs has received from her Majesty's Chargé d'Affaires at Madrid copy and translation of the particulars for tenders called for by the Spanish Government for six steam launches to carry Maxim guns. The launches are to be of 40 metric tons displacement, and the tenders will be opened on the 26th inst. at Madrid. The particulars can be seen at the Commercial Department of the Foreign Office, S.W., between the hours of eleven and six.

Correspondence.

The Editor welcomes Correspondence on matters of general interest. Gentlemen thus addressing the Editor should condense their communications as much as possible.

"NORI."—Your letter shall appear next week.

To the Editor of "THE BUILDERS' JOURNAL."

DEAR MR. EDITOR,—In your kindly article of the 16th inst., the writer has, unintentionally, I am sure, been led into some inaccuracies, so likely to arise in recording one's recollections of an interview, and so I claim a little space in your journal to correct them, with your permission.

My remark in my letter as to my work lying "more in the past than in the present," referred particularly to such services as I had been able to render to the Institute, and more especially to the A.A., though my interest in both is as keen as ever; but as regards my own work, I hope the future is still before me.

I had the honour of twice acting as president of the A.A., and in that capacity having a seat on the Council of the Institute. The invitation to name fitting members for the Council (for its guidance in publishing their List) came to me—as to all—as a member, and not as in any way connected with the A.A.; and, on the spur of the moment, I wrote that I thought the A.A. should be represented, hardly dreaming it would be taken seriously. To my surprise I received a courteous letter, asking if I would stand for election, which I did, and was indeed proud of the honour done to the A.A. The Committee were not asked, as far as I know, until my successor filled the presidential chair.

At the interview I gave my views on the Examination question, and what I intended to convey was, that though in favour of examinations for admission to the Institute, believing them to be of great importance as an incentive to young men to qualify themselves in the many branches of their work, I yet felt that it was not possible to examine men in those particular qualities and gifts which make an architect, no more than we can in other callings in all that goes to make the man who rises above his fellows.

One other remark and I end my letter. "Sketch and measure, measure and sketch," was the dictum of William Burgess—not Fergusson.—I am, dear Mr. Editor, yours faithfully,

COLE A. ADAMS.

[The number of men who have presented themselves for examination shows that young architects of the present day are not adverse to the system, and is the best answer to the fears of those who deprecate the system and its effect upon Art. To believe that the study, necessary to pass, blunts a man's artistic faculties, we shall not believe, especially when we see the good work that so many of them turn out who have passed the examination. The fact that the plan of the preliminary, intermediate, and final examinations, had the cordial support of no less a man than the late Mr. G. E. Street, R.A., alone carries great weight.—ED. BUILDERS' JOURNAL.]

A SUPERB brass eagle lectern was unveiled in Manchester Cathedral on Easter Eve. It was presented to the Cathedral by Mr. Craven, in memory of a deceased brother.

APPLICATION has been made by the Town Council of Blackpool, for sanction to a loan of £1,750, to defray the cost of erecting a proposed branch Police Station at Queenstown.

KILSCANNEL Church, county Limerick, has been destroyed by fire. The fire is supposed to have been caused by the stove pipe which passed through the ceiling. Only the bare walls were left standing.

MR. J. WM. TROUNSON, F.S.I., of Penzance, has just laid his scheme for the Water Supply and Sewerage of Hea-moor District before the Madron Urban District Council, and the whole matter is to be forwarded to the Local Government Board forthwith.

It is reported in Paris, that the authorities intend to construct a second Morgue, the accommodation of the existing building having proved insufficient. The locality of the new building has not yet been decided upon.

THE new Church of All Saints', at Ringway, near Wilmslow, which has just been completed, stands on the site of the old building, and has been erected at a cost of £3,000 by the patron of the living—Lord Egerton of Tatton.

THE sanitary arrangements at the Hôtel Cimiez, Nice, where the Queen is at present residing, have been specially re-arranged on the latest improved principles, embracing Boyle's self-acting air-pump ventilators and other approved appliances.

A MEMORIAL having been handed to the Chairman of the Mexborough District Council, urging the desirability of holding a town's meeting, for the purpose of placing before the ratepayers the whole of the water question before the purchase is effected at a cost of £10,000, arrangements have been made for a meeting to take place this week.

By the draining of Lake Kopais Greece gains 60,000 acres of rich alluvial soil. The Greek Merchant Marine counts (1893) 116 steamers of 83,508 net tonnage, and 944 sailing vessels, aggregating a burden of some 250,000 tons. Much of the carrying trade of the Levant and nearly all of that on the Danube is in Greek bottoms.

At the monthly meeting of the Wakefield City Council, the Electric Lighting Committee recommended that tenders for electric lighting works should be obtained, and that application should be made to the Local Government Board for power to borrow £25,000 to defray the cost of the works. The recommendation was agreed to, and the works are to be carried out with as little delay as possible.

EFFORTS are being made for the erection of a new Church for the Hall Street district, Stockport. The late Mr. R. Bamford-Hesketh, of Gwyrch Castle, Abergele, promised a site for the Church, and £1,000 to the building fund, and this promise has been renewed by his widow, and will be supplemented by liberal contributions from the vicar of Stockport and others.

THE Duchess of Teck, on Wednesday, opened a bazaar in aid of the funds of the Derby Royal Infirmary. Her Majesty the Queen laid the foundation-stone of the structure in 1891, and it is now rapidly drawing to a completion, having been erected at a cost of £90,000, the whole of which has been subscribed by the town and county. It was opened free from debt, but it was found that a further sum of £4,000 would be required for the furnishing, and the Governors hit upon the idea of holding a bazaar for raising this sum.

THE Penzance Town Council having invited drawings for an Infectious Diseases Hospital to be erected at a cost of about £3,000, and offered premiums of thirty, twenty, and fifteen guineas, the following awards have now been made:—First premiated design, Mr. Hampden H. Pratt, architect, Rolls chambers, 89, Chancery lane, London, W.C.; second premiated design, Mr. F. Hunter Lines, 102, Darlington street, Wolverhampton; and third premiated design, Mr. F. E. Pearce Edwards, Liverpool, and Mr. Arnold Thornely, Birkdale.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the work.

ABERTILLERY (Mon.).—For the erection of school buildings, Queen-street, for the Aberystwith School Board. Mr. Geo. Rosser, architect, Victoria-buildings, Abercarn. Quantities by the architect:—

CONTRACTS OPEN.

TO SANITARY ENGINEERS.

The Manchester Corporation invite TENDERS for PROVIDING and FIXING SANITARY FITTINGS in the Town Hall, Albert-square, Manchester.

Particulars and lithograph plans of the building may be obtained on application to Mr. T. de COURCY MEADE, City Surveyor, Town Hall, on deposit of £5, which will be returned on receipt of a bona-fide tender.

Tenders to be addressed to the Chairman of the Town Hall Committee, and delivered at the City Surveyor's Office, not later than FIVE p.m. on WEDNESDAY, the 8th May, 1895.

The Committee do not bind themselves to accept the lowest or any tender.

WM. HENRY TALBOT, Town Clerk.
Town Hall, Manchester,
April 9th, 1895.

TO SANITARY ENGINEERS.

The Manchester Corporation invite TENDERS for PROVIDING and FIXING RANGES of SANITARY FITTINGS in the various conveniences at Philips Park and Queen's Park, Manchester.

Particulars and lithograph plans of the Conveniences may be obtained on application to Mr. T. de COURCY MEADE, City Surveyor, Town Hall, on deposit of £2 2s., which will be returned on receipt of a bona-fide tender.

Tenders to be addressed to the Chairman of the Parks Committee, and delivered at the City Surveyor's Office, not later than FIVE p.m. on WEDNESDAY, the 8th of May, 1895.

The Committee do not bind themselves to accept the lowest or any tender.

WM. HENRY TALBOT, Town Clerk.
Town Hall, Manchester,
April 9th, 1895.

TO BUILDERS AND CONTRACTORS.

BEXLEY SCHOOL BOARD, KENT.

The above Board are prepared to receive TENDERS for the ERECTION of the Upland Board Schools, Mixed and Infant Departments.

Plans, specifications, and conditions of contract may be seen at the Offices of Mr. STAFFORD ELSMORE, Architect, of 13, Clifford's-inn, E.C., between the hours of TEN a.m. and FIVE p.m., and Saturdays to ONE p.m.

Bills of quantities with form of Tender may be obtained from the Architect upon payment of £2 2s., which will be returned on receipt of a bona-fide Tender.

No application for bills of quantities will be received after TWELVE o'clock noon on WEDNESDAY, APRIL 24th, 1895.

Tenders, upon the forms supplied, must be delivered to me sealed and endorsed not later than HALF-PAST SIX, MAY 2nd, 1895, and they will be opened and considered the same evening.

The party accepted will be required to enter into a bond for the due fulfilment of the Contract.

The Board do not bind themselves to accept the lowest or any Tender.

School Board Offices, WALTER J. WEAVING, Clerk.
Bexley Heath.

WESTMINSTER UNION.

TO BUILDERS AND CONTRACTORS.

The Guardians of the Westminster Union are desirous of receiving TENDERS for RE-BUILDING the WEST BLOCK of their Workhouse, in Poland-street, Oxford-street, London, W.

The plans and specification can be seen, and bills of quantities and forms of tender obtained, on application to Messrs. Jno. Waldram and Son, 13, Buckingham-street, Adelphi, W.C., the Engineers and Surveyors to the Guardians, on payment of the sum of £3 3s., which will be returned only on the receipt of a bona-fide tender.

No bills of quantities can be supplied after the 30th April, and the tenders must be delivered sealed at the Board-room of the Workhouse, not later than THREE p.m., on FRIDAY, the 10th day of May next.

The Guardians do not bind themselves to accept the lowest or any tender.

By Order,
JOSEPH BOND, Clerk.
Poland-street Workhouse, London, W.,
April 10th, 1895.

TO PAINTERS and OTHERS.

The Trustees of the Borough Market are prepared to receive TENDERS for REPAIRING and PAINTING the ROOF over the Covered Stands on the North side of the Borough Market, Southwark, S.E., in accordance with the specification prepared by Messrs. Henry Jarvis and Son, Architects, of 29, Trinity-square, Southwark, S.E., copy of which can be obtained on application to them, between the hours of TEN a.m. and FOUR p.m. on any week day.

The Tenders to be delivered to me at the Parochial Offices, Borough Market, S.E., on or before ELEVEN o'clock on FRIDAY, the 26th instant, when they will be opened.

The Trustees do not bind themselves to accept the lowest or any tender.

By order of the Trustees,
G. A. HOLDITCH, Clerk.

CONTRACTS FOR SUPPLY OF BUILDING MATERIALS TO DARTMOOR, PARK-HURST, and PORTLAND CONVICT PRISONS.

Persons desirous of TENDERING for the SUPPLY of TIMBER, DEALS, BRICKS, LIME, CEMENT, SAND, SLAB and ROOFING SLATES, &c., for "New Buildings," for the period ending March 31, 1898, are requested to send their tenders, prepaid, to the Directors of Convict Prisons, Home Office, Whitehall, S.W., on or before SATURDAY, MAY 4th, 1895, at noon.

Forms of tender can be had on application to this office, Prison Department, Home Office, S.W.
April, 1895.

TO BUILDERS.

The Town Council of Gravesend invite TENDERS for the ERECTION of MUNICIPAL OFFICES in the rear of the Town Hall, in accordance with drawings and specification prepared by Mr. A. G. SMITH, M.S.A., Architect, at whose Offices (No. 1, Darley-street, Gravesend), they can be inspected on and after MONDAY, APRIL 30th, during business hours.

Bills of quantities can be obtained of the Architect by any applicant on payment of a fee of Two Guineas returnable on receipt of a bona-fide Tender from the applicant, but the employer does not warrant their accuracy.

Tenders in sealed envelopes endorsed "Tenders for Offices," must be delivered at my Office in the Court House on or before MAY 14th.

The contractor must be prepared to execute the contract, and be bound by the general conditions which can be inspected as aforesaid, and to give security in the sum of £250.

The Council do not bind themselves to accept the lowest or any tender.

CHAS. E. HATTEN, Town Clerk.

SPINCTER WORKS, EMERSON STREET, LONDON, S.E.

An Ideal City.

SCIENCE, even sanitary science, can, now-a-days, indulge in ideals. Time was when Science was very cold-blooded and morose, looking at things under a perpetual cloud.

But, latterly, some sunshine and, we must admit, some sanitation, have crept in, and men like Moncure Conway are thereby encouraged to dream dreams. Sir W. B. Richardson is not a dreamer of dreams, but he has always been on the side of Hope, and we might add—soap! Sir Benjamin preached Sanitation in the days when it was an unsavoury subject. Twenty years ago he built up, in imagination, that famous city Hygeia, wherein, if a man was ill, it was his own mistake. At the closing meeting of the Sanitary Conference in Manchester, Sir B. W. Richardson referred to this City of his own designing. The years have done something in realisation, but there is yet much to do. Hygeia has sprung up everywhere—in parts only—and still the City destined to be immortal (in the Health Sense) does not exist. Human flesh (and Borough Surveyors) are very weak! But the "working model," taken to pieces, has been found pregnant of ideas, and many a town has benefited by a sewer here or a suggestion there, outcome of Richardson's science. At the Conference in Manchester the architect of "Hygeia" aired a very bold theory. The whole country, he said, was now surveyed, laid out, levelled and prepared with infinite toil and engineering skill in the network of railways which inter-

sected everywhere; it seemed to him they had nothing to do but to construct along the sides of all these great railways a series of iron or brickwork tubes, to start from every place where there were houses, and to let the sewage from those houses be pumped into the main by the side of the line and be collected and conveyed to spots of land selected for

is well known, be the stimulus of the country, properly applied, as Nature has a curious chemistry and filtration of her own; yet it is true that sewage is still the greater problem to a number of our large towns after its collection is completed, though Sewage Farms have undoubtedly been a step in Sir Benjamin's direction. He, at least, is an

enthusiast in the matter; he sees no more difficulty in the laying of railway conduits than in the setting down of telegraph poles. The conduits in the towns themselves need not be larger than the water tubes, and only simple motors would be required as the gradients (being railway gradients) would not be great. And what could be so carried away could be so brought in. Pure water, for instance. Thus a complete circulatory system could be set up; a kind of "arterial and venous" system, as Sir Benjamin described it. No one with any common sense, or knowledge of infectious diseases, now disputes the value of hospitals. Hospitals are immeasurably the surest safeguard against the spread of disease, and the private-house-system-of-being-ill (if we may so describe it) is rapidly becoming disapproved, though, like all traditions, it dies hard. Sir Benjamin's ideal is that "hotel-hospitals, comfortably, and even elegantly furnished, should be erected with everything necessary for the sick in any kind of disease. . . . Small hospitals could be placed on the tops of private houses, with lifts for taking the sick up into them." This sounds so new and novel that we should not be surprised if the patent grew well on the way! Finally, towns themselves should be ventilated. With this we quite agree. Compressed air, brought

THE CHAPTER HOUSE, WELLS CATHEDRAL : SKETCHED BY C. E. MALLOWS.

utilisation, so that the land might receive direct the benefits of sewage for the purposes of fertilisation. Is Sir W. B. Richardson going to be the Ideal Agriculturist also? For the incubus of town sanitation might, it

ing the sick up into them." This sounds so new and novel that we should not be surprised if the patent grew well on the way! Finally, towns themselves should be ventilated. With this we quite agree. Compressed air, brought

from the heights; proper courses for wind through the streets; footways, flowers, and gardens on the roofs of houses, roadways thereupon for foot passengers, not to say postmen; and a more favourable view of cremation, are all parts of Sir B. W. Richardson's Ideal City; together with a "dinner of herbs where love is," and water! But really, Sir Benjamin, we do not wish to live for ever, and we are just a little afraid that so ideal a city would be supremely dull. However, you may begin with London—scope like scheme, would then be big enough, and we can do with some "compressed air from the heights" at most seasons of the year.

Averted— for a time.

UNLESS some unforeseen circumstance arises, the Building Trade Strike is averted, for the time. On Thursday, the London Master Builders decided to continue the existing working rules pending the appointment of an arbitrator, to whom the disputed new rules and other matters should be referred, and that such arbitrator be appointed by the First of June. In other words, there is a month's breathing time gained, during which wiser counsels may prevail. Two documents, published last week—one a manifesto, the other a letter—were significant, bearing, as they did, upon the crisis. Mr. G. H. Trollope, President of the Central Association of London Master Builders, wrote denying the tintured statement that the masters sought to introduce a system of "sweating" or "piece-work." He gave a succinct account of the origin of the present working rules. Early in 1891, there were rumblings of approaching storm, and carpenters and joiners obtained a formulated code of rules for their particular trade. A year later the bricklayers failed to obtain a similar arrangement, but their discontent led to a general conference in June of 1892, resulting in a general set of rules for the whole trade. Mr. Trollope points out, and it is well known, that the employed endeavoured to compel employers to discharge Non-Union men, once this general set of rules was in vogue. To meet this, six months' notice for the termination of these rules was given, and a revised code was drawn up, dealing with the "Non-Union" difficulty, and with the further vexed question of sub-letting. The men have up to this moment refused to consider the new rules, and the rules of 1892 "end automatically" (as Mr. Trollope puts it) on May 1. "Piece-work," Mr. Trollope maintains, is not even a genuine bogie. The question has never been raised. The one point at issue is whether builders and trade leaders can arrange for the harmonious working of Union and Non-Union men. There is now the month of May—thanks to this extension of time—wherein to bring the opposing factions into co-workable silence instead of non-workable uproar. The manifesto to which we have referred is that issued by the Alliance Carpenters' and Joiners' Society—a "Free" Society (sounding of paradox) organised to fight the Building Trades' Federation. The manifesto states that in London at the present moment, out of 150,000 men connected with the building trade, only one-fifth are Unionists. Yet this insignificant minority has secured almost absolute control over the majority. The Non-Unionist is met, at every turn, by hindrance, molestation, and coercion; "take a Federation ticket or starve" is the tyrannical "mot d'ordre" when he endeavours to obtain work. Should he, however, join the Union, he quickly discovers that he has bartered his independence for a very miserable mess of pottage. From that moment, he must do as he is ordered; if directed to throw up good employment, with which he is perfectly satisfied, throw it up he must or life will not be worth living. The Alliance

proposes, therefore, to end this system by organising the majority to fight the minority with equal weapons. Set a thief to catch a thief was the old axiom. Shall we amend it so: Set a Society to catch a Society? If so, in this case we may even go so far as to believe one Society honest!

A Chance for London Architecture.

THE Old Cry of a New Street between Holborn and the Strand has been revived, and once again there would seem to be a possibility of Architecture having a look-in in London. But it is so old a cry that architects will be inclined to turn a deaf ear if only to keep their ambitions at rest. What is the good of dangling street-frontages before our eyes; frontages that may never be built? Yet the condition of the Strand this last month would have disgraced any city in the World—not American. We will back New York, any dirty day, for mud and misery. But the congestion of traffic, with the Embankment "up," has been absolutely critical to life and limb and a positive drain upon a man's pocket and patience, and if only to make ourselves happy in contemplation of the improbable, we welcome this old friend the New Street back again. He is something of a ghost; at any rate, he has no visible means of subsistence, but quite a number of clever people are interested in him, and give him the kicks and ha'pence that keep him alive. And so the County Council is to be "approached" (certainly the correct way of getting there!) in the matter, and St. Martin's Town Hall and its public men have resolved, with "much unanimity," to request the Council "to take immediate steps in proceeding with the construction of a new street from Holborn to the Strand. This meeting reminds the Council that the Council itself has frequently admitted the urgency of such a street; that public opinion has been often and widely expressed at public meetings, from which deputations have been sent to the Council; that the general Press of London has again and again urged the necessity for such a new street; that the chronic block existing through the congestion of traffic is injurious to trade and labour, dangerous to personal safety, and especially inconvenient to travellers passing between the northern and southern railway termini. Besides these reasons, a new street is urgently needed for the convenience of the whole Metropolis, there being no direct communication between North and South London." A "case" up to the hilt, if you like, and the only thing it seems to suffer from is an excess of conviction. But if only a broad street, or better still, a boulevard, could let in the light of average day between Holborn and the Strand, what a chance for Architecture and Architects, and even Sculptors, there might be! At present there is plenty of Art in the intervening district, but it happens to be so Realistic. Who is not disgusted with Drury Lane and Clare Market? All, at any rate, but the people who live there, and even they may be, for what we know, poor things—there is so much talk of Art reaching the masses, one never can tell. But Nature always seems to us uppermost in Clare Market.

THE new departments for girls and infants at the Abbeydale Board School were opened last week. The design of the building harmonises with the older buildings. The accommodation sanctioned by the Education Department is for 782 scholars. The contractor for the general work was Mr. John Greenwood. The asphaltting of yards has been done by Mr. John Hadfield, Ellesmere Road; the warming apparatus by Messrs. J. C. and J. S. Ellis. Mr. E. Cartwright has acted as clerk of the works, and the architect is Mr. C. J. Innocent, 17, George Street, Sheffield.

THE INSTITUTE AND THE A. A.

III.

BUT we ask, and again, Who is to start the restoration of the Institute? Mr. Penrose is not the man. He, like all that is best in the Councils at Conduit Street, is too little self-assertive. Alfred Waterhouse could do it if he would. In him are all the attributes, but the task wants the energy and, perhaps, a little of the impulsiveness of a younger man. It is hardly possible—lacking the individual—that the Council will initiate an action to condemn itself, but it might, if the majority has an atom of honest respect for the Institution left to it, appoint a committee of past presidents to sit in solemn conclave and report upon the subject. As well expect Father Thames to condemn his own waters as to expect this much! On all sides we hear whispers of advice. Many of the highest men in the profession have not hesitated to tell us boldly and frankly of the need of such things. We have letters from all quarters and from all creeds telling us—under the ban of privacy—how *this* would improve matters, and how *that* would advance the profession. And yet no movement comes. Everything appears to us to be sickled over with a fulsome cloak of indifference, under which is a fermenting mass of grumbling professionalism, that needs pricking into open revolt. We are sick of the flummery of this professionalism flaunted in the face of our young men. The other week an unsophisticated young gentleman addressed a communication to a professional contemporary, making a most terrible charge against a Fellow of the R.I.B.A. He was walking calmly home one evening, when—horror!—he discovered the name of a well known architect displayed upon a board attached to the scaffolding of a new building. The unsophisticated one did not quite faint, but he conveyed the intelligence—under a *nom de plume*—to the said contemporary. The communication appeared, and with it an unsophisticated editorial comment. That name on that board was also horrible to the unsophisticated conductor of that journal. The following week Mr. John Slater, B.A., F.R.I.B.A., unsophisticatingly announced that he had no knowledge of his name and his title to fame appearing in such a disgraceful manner, and had he known it he would, of course, have obliterated the wretched person who had so magnanimously violated the laws of Architectural professional etiquette. Again, an editorial foot-note, unsophisticated in its scathing denunciation of any motive so socially high a person as Mr. Slater could possibly have had in such a proceeding. A more sublime piece of "flummery" as this could not exist. Mr. Slater, who is a man we know to be above dishonourable actions, a man who has written good works, executed good works and delivered good works before the professional societies—a man known by all men to be a sterling good fellow—is tripped by the flummery of another dealer in this same produce of modern life. Mr. Slater had no backbone. He should have stood to his guns, and fought this fiend of professional immorality and unmasked him on the spot. Who laid down the law that to proudly place one's name upon one's work is against the etiquette of Art? Is it against the etiquette of Art or is it nothing but the flummery of which we have spoken? Why should not an Architect plant his name in front of his creations without calling down the attacks of the insidious? By what canon must he wait until he be dead for his name to be placarded upon his deeds? Short of advertising for work, he cannot err upon the demands of professional etiquette, else half of the successful practitioners of the day would be without it. And continue the argument to

our contemporary. Could finer flummery emanate from a man who has the good sense to deposit his journal in every pothouse in the purlieu of the City, "free, gratis, and for nuffink," as Mark Twain says, on condition that the proprietor sticks a blazing notice in his window that the such and such a thing is "taken in here." The whole business is a monstrous piece of hypocrisy, cankering the root of architectural practice. The name upon the board is innocent of any indecent motive. The architect is proud of his work as it grows piecemeal into existence, and if it be good in the eyes of men who see it, the name of the author is worthy of their knowledge. The journal in the pot-house, and the placard in the window is an honest means to an honest end, and if that is permissible by the etiquette of one artistic calling, by what sense is it unpermissible in another? For ourselves, we do not distribute the "BUILDERS' JOURNAL" in this manner, but even that may come, and in the meantime we advise every young man doing honest work, and precious little of it, to try and do more, by placing his name upon the front of his building, and give no heed to the knave who carves it upon a foundation stone and warns his fellows off elsewhere.

But in our efforts to wade through the waters of reform, we get deeper and deeper into the mud which lies at the bottom. We have a higher motive than the mere booming of ourselves and the raking in of the shekels of successful "trade" journalism. No one sees the imperfections of an Institute, like the Royal Institute of British Architects, so much as he who watches it from above, and hears the murmuring of the crowd below. Architecture is the noblest of all the arts, and the head of its administration should be as powerful as it is possible to make it. We have in the Architectural Association a body of earnest men, impossible of collection in any other country in Europe. The Association has done miracles in the advancement of Architecture, and the band of splendid fellows who have worked at it and in it for years, who have loved it and given up their leisure for it, and who, when they get beyond the circle of its influence still bear a magnetic attraction towards it, are worthy all the admiration it is possible to bestow upon them; but how much more should the Institute warrant such commendation! If it is impossible that reform should come from within, then it must come from without, and all those men, headed by Norman Shaw—whom, heaven knows, we appreciate to the full—who have remained callous so long, have no right to stand aloof from the rescue of their profession, while at its concentrated head in Conduit Street so much work is to be done. We want to see the Institute a power in the land and a power in commanding the respect of the multitude. We want to see true artists at its head—men who live and breathe and have their being in architecture. We want to see the Institute strike terror in the hearts of the ruffians of speculative building; and we want to see it consulted by the official fools, who have the making of architectural London and make it badly. If only funds be needed to lift these things into being, a good round sum from the proprietors of this Journal is at its disposal, and we dare swear, that from two of our rich contemporaries at least the same or a greater amount would be forthcoming. There is no desire to shirk the issue; we are not philanthropists at Talbot House. The long-haired gentlemen who chew Faber's pencils instead of American gum, have a room to themselves; they tread on Turkey carpets and write with jewelled pens—but the rest of us are just honest men, with the commercial spirit strong within us, and what is the most surprising of all things, have the decency to admit it.

LIGHTNING ON A MONUMENT.

A SERIES of very interesting experiments has been conducted by the Weather Bureau people upon the Washington Monument, which, standing 555 feet high in the centre of a flat, well-watered ground, constitutes a most dangerous exposure. It was struck by lightning on June 5th, 1885, which suggested that measures be taken for its safety, and a Committee of scientific men was appointed to investigate the subject. The report was in favour of erecting rods, and there are now four copper conductors running from the top of the Monument into a pit or well 15 feet below the bottom of the masonry foundation, in which there is permanently two feet and eight inches of water. They are also connected with each other by means of copper rods, and are studded at every five feet of their length with copper points three inches long, gold-plated and tipped

RESTORING A SUN-DIAL.

THE work of restoring and fixing the sun dial in the parish churchyard of S. Mary, Lancaster, has been completed, and the time-indicator is now in working order. The cost of the restoration has been defrayed by Mr. Fenton. The stonework has been re-erected by Mr. Warbrick, under the supervision of Messrs. Paley, Austin and Paley, and the dial is the work of Mr. Robert Atkinson, being a most interesting piece of work. In the centre of the dial, the latitude and longitude of the Parish Church are indicated, showing that the local time is 11 mins. 10 secs. after Greenwich mean time. Underneath is the Latin inscription:—"Sic umbra vertit sic vita fugit" ("As the shadow turns so life flies"). At each corner of the dial-plate is set forth the equation of the

LLANDAFF CATHEDRAL AND CHAPTER HOUSE, FROM THE SOUTH-EAST,
SKETCHED BY C. E. MALLOWS.

with platinum. Since that protection was placed upon the Monument it has not suffered any damage, although the lightning plays around it every time there is a thunderstorm. During the summer season Professor McArdie, the lightning sharp of the Weather Bureau, has a camera constantly trained upon it so as to make negatives of the flashes as they occur. A second camera at Fort Myer, a signal-service station on the Virginia side of the Potomac, and a third on the roof of the house wing of the Capitol, are used for a similar purpose. The distance between each of the cameras and the Monument has been accurately ascertained, and the photographs are used for the purpose of determining the true direction of the flashes and measuring their intensity and velocity. The direction of the flash can be determined by the photographs taken from the three points of view, and the measurements are made by triangulation.

time table for all the months of the year showing when the sun is behind the clock and when it is before. This will enable the observer to work out the correct time at a glance. The dial-plate, which is of brass, is constructed in two pieces, the better to secure accuracy of adjustment. A square of brass drops into the stone pillar, and the dial proper, which has a circular edge, fits into the other part, and the exact position is thus easily secured. The gnomon is made particularly strong, and cannot be broken except by someone determined to do so.

MESSRS. WALTON & LEE, of Mount Street, Grosvenor Square, have sold to Mr. Ashley Dodd the home portion of Colonel Leslie Toke's Godinton estate, near Ashford, Kent. The price closely approaches £50,000.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
30th April, 1895.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."

—JOHN RUSKIN.

It would appear, from certain indications, that some alterations are proposed to be made to the front of the National Gallery. A short time ago, holes were dug in the raised forecourt, and unsightly heaps of rubbish left exposed. Later on, the paving and the curb of the railing enclosing the forecourt were marked in lots as if in preparation of a sale by auction. It is important that no alteration should be made in the aspect of the building without mature consideration, and it is to be hoped that some member of Parliament will obtain an assurance from the First Commissioner of Works that nothing will be done which will prejudicially affect the design of the front. In spite of considerable detraction, Wilkins' design has a merit of its own, and a certain charm and refinement which we can ill afford to see weakened or obliterated.

TOGETHER with a few remembered oil paintings that have been at the Royal Academy, Mr. Stacy Marks is showing, in one of the rooms at the Fine Art Society, a number of recent water-colour drawings. These are, of course, of birds, and for the most part they are of the parrot tribe; a family with whose plumage, whether of the flakey whiteness of cockatoos or the gorgeous raiment of macaws, he is so familiar. Nor is it only with the outward seeming of these and other birds that the artist is thoroughly at home. He knows their tempers and their ways very intimately, nor has he upon this occasion exaggerated those characteristics which bear a humorous likeness to human nature.

THE old proposal to extend Chelsea Embankment is to be renewed. At the next meeting of the County Council a deputation will be introduced by Earl Cadogan and Mr. Whitmore, M.P., with a view of urging upon the Council the reconsideration of the subject. It is estimated that to extend the Embankment from the new Chelsea Bridge to the Kensington Vestry Wharf, a distance of 400 yards, would cost £64,000. Towards this the Vestry are willing to contribute £8,000, but the late County Council declined to entertain the project unless the Vestry would contribute £21,000.

UNUSUAL interest attaches to the operations of the Silchester Excavation Committee, who have unearthed, for the first time, the workshops of Roman dyers in Britain. By permission of the Council of the Society of Antiquaries, an Exhibition is being held in Burlington House, of the various objects of interest brought to light by the excavations. Plans and drawings are also exhibited. The

Exhibition represents the results of the excavations of the fifth season, which were begun last April, and continued, with the usual break during harvesting operations, until October. The season's excavations were productive of results differing entirely from those of former years. They are also of far more than ordinary interest, since they throw light, for the first time, on the industries of a Romano-British town, a subject on which hitherto no information has been accessible. The town, which covers a hundred acres within the line of wall, is a mile and a half round, and the excavations, which have so far extended to about 40 acres, have revealed a market place, courts of justice, a circular temple, and baths. With the exception of the irregularly placed house of the corridor type, and possibly of a second south of it, only one other house has come to light in the four insulæ excavated. The remaining ground is occupied, chiefly along the main line of street, by a series of rectangular enclosures or buildings, in connection with which are placed somewhat capriciously a number of very curious hearths or remains of furnaces. Besides these rectangular enclosures, all placed along the main street, there are other smaller buildings, chiefly in the open ground which lies behind them. That these buildings and adjuncts are not of a domestic character is obvious, and they can only have belonged to some industry to which this quarter of the city was apparently devoted. There is every reason to believe that this industry was that of dyeing, a suggestion to which support is given by the unusual number of wells discovered. Comparison with buildings used for similar purpose in Pompeii confirms this idea. With the exception of a medium-sized capital and base of a Doric column, and a fine slab of Purbeck marble, no important architectural remains have been discovered. Of minor objects in metal, bone, glass, and iron, the usual variety has been found, including a gold ring of good design. The ordinary find of coins has been surpassed by the discovery of a hoard of upwards of 250 silver denarii of early date, ranging from Mark Antony to Severus, covering a period of about 250 years. These were claimed by the Treasury as treasure-trove, but were subsequently returned for inclusion in the Silchester Loan collection in the Reading Museum, after the deduction of a certain number for the national collection in the British Museum.

THE Kaye family, of Cawthorne, near Barnsley, have decided to bear the whole cost of completing the fabric of Oakenshaw Church by the erection of a Tower and Spire (120 feet high), and the addition of a Choir Vestry and Porch on the south side. The Church was erected six years ago at a cost of £4,500, the members of the same family being liberal subscribers to the original funds. Messrs. Milnes & France, of Bradford, the Architects, have been instructed to proceed with the works at once.

It is not generally known that Ford Madox Brown was once a partner in the firm of William Morris & Co., and whilst so engaged prepared a series of cartoons for stained-glass windows. These were bought at his sale by Mr. Harold Rathbone, who, considering that they should be more extensively known, has gone to the expense of reproducing twenty of the most important. These he will publish very shortly through the Autotype Company. Apropos of reproductions, certain experiments which have been conducted in Germany in imitating paintings in colour have met with a success which is astonishing. A specimen of Raphael's "Marriage of the Virgin," which will shortly be on view in London, will show what a considerable advance has been made.

At the meeting of the Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, grants of money were made in aid of the following objects:—Rebuilding St. Mary's Church, Swansea, £350; towards enlarging or otherwise improving the accommodation in the Churches at Claphorn St. Leonard, near Oundle, £25; Killamarsh St. Giles, near Rotherham, £20; Poynington All Saints', near Sherborne, £25; and Watney Street Christ Church, in the parish of St. George's-in-the-East, £20. The following grants were also paid for works completed:—Fleur-de-lis St. David, in the parish of Bedwelty, near Cardiff, £100; Brixton St. Mary, near Plymouth, £40; Wetton St. Margaret, near Ashbourne, £20; St. Mabyn, near Bodmin, £40; and Barnsley St. Paul, £30. In addition to this, the sum of £427 was paid towards the repairs of 39 Churches. The committee sanctioned the appointment of Mr. R. Norman Shaw, R.A., as president of the Committee of Honorary Consulting Architects, in the place of Mr. Ewan Christian, and the two vacancies on the committee were filled up by Mr. T. Graham Jackson, A.R.A., and Mr. C. H. M. Mileham.

THE Finance and Estate Committee of the Liverpool City Council recently considered a report from the Corporation land steward and surveyor (Mr. T. Sheldermine, jun.) on the value of the land fronting to Byrom-street, which the Library, Museum, and Arts Committee desire to have set apart as a site for an extension of the Museum and School of Science and Technology. Upon consideration of this report, they passed a resolution to inform the Library, Museum, and Arts and Technical Instruction Committee that if the Council approve of a scheme for the extension of the Library and Museum buildings, the Finance Committee are prepared to recommend the Council to appropriate the land at the corner of Byrom-street for the purpose, subject to the museum account being charged with the payment of a ground rent of £600 per annum, to be carried to the credit of the general rate. By a recent resolution the Council decided to adopt the Museums and Gymnasiums Act, which, from the 1st January next, will enable the Library, Museum, and Arts Committee to levy a rate of $\frac{1}{4}$ d. in the pound for museum purposes alone, in addition to the rate of 1d. which at present covers all charges in connection with the public institutions—the central and branch libraries, reading-rooms, museum, art gallery, and public lectures—under the direction of the committee. This 1d. rate has now for some years been inadequate to meet the growing demands upon it, and its insufficiency has been further increased owing to the Finance Committee having instituted within the past year or two the practice of requiring the payment of city rates for the Library, Museum, and Art Gallery—a payment which absorbs a considerable proportion of the Library Committee's income. The present resolution of the Finance Committee, which is pretty certain to give rise to a severe contest in the Council, is in pursuance of the policy that no part of the estate of the Corporation shall be devoted to public purposes, without, if possible, a payment to the city fund out of the rates controlled by the Committee using the particular property as nearly as may be equivalent to what would be received from private leaseholders. The $\frac{1}{4}$ d. museum rate will bring in something over £5,000 a year; but this for thirty years at least will be no more than enough to pay the interest and sinking fund of the sum needed to carry out the extension. Hence, if the view of the Finance Committee be upheld, the Library Committee would have to administer the larger building out of resources which would be £600 a year

less than at present. In the view of those interested in this improvement the resolution cripples the scheme.

It is said that large orders are shortly to be given by the Russian Government for material for the construction of new railways and important extensions of the systems in the eastern and southern parts of the empire in Europe, and that a large proportion of such orders may be considered likely to be given to English firms. In anticipation of this, several representatives of French and German houses have arrived in St. Petersburg, but, with the exception of something given to one of the French agents, no orders have as yet been placed. It is also stated that the laying and equipment of just over two thousand miles of new rails are to be provided for, partly for military purposes, but chiefly in order to open up the agricultural districts.

NEXT year, the centenary of the death of Robert Burns, a statue of Highland Mary will be unveiled at Auchamore Farm, near the town where Mary Campbell was born. It will be of white marble, and will be easily seen from the decks of passing steamers on the Clyde, as it will be placed on the rocks in front of the ruins of Dunoon Castle. The figure will be standing, the head turned aside slightly. The details of costume will be exact, including kirtle, plaid, and shawl. The sculptor is Mr. W. W. Stevenson, of Edinburgh.

THE Vestry and the Public Library Commissioners at Hampstead are at loggerheads, and seven of the nine forming the latter body have resigned office. A year or two ago the ratepayers of the borough of Hampstead adopted the Public Libraries Act, on the first occasion of a poll being taken on that subject, and the Hampstead Vestry appointed nine Commissioners to carry out the provisions of the Act. The Commissioners purchased a site for a Central Library, took over the management of a Free Reading Room in the old part of Hampstead, established a branch Free Reading Room and Lending Library in Priory road, Kilburn, and established an open-air station for exhibiting daily newspapers in rotation throughout the week in another portion of the parish. For the Central Library they invited plans from a selected number of architects, with the late Mr. Ewan Christian as arbitrator, proposing to expend a sum not exceeding £9,000 on this building. At this point disagreement sprang up between the Vestry and the Commissioners. The Vestry, having the power to give or refuse its sanction to the proposed expenditure of the Commissioners, claimed the right of being consulted with reference to the proposed Central Library, and soreness was also felt with regard to the selection of architects. Mr. H. Harben, J.P., Chairman of the Vestry, presented £3,500 to the Vestry towards the cost of the Central Library building, and offered to increase that generous gift to £5,000 provided that not more than that sum was expended for such a building. In

this he was supported by the Vestry as against the Commissioners, who maintain that a building worthy of the parish cannot be erected for that amount. The Vestry has applied to the Local Government Board for power to take over the duties of the Library Commissioners under the Parish Councils Act, and the ratepayers have received by post a communication from the commissioners, announcing the resignation of seven of their number. Meanwhile a very generous gift lies in abeyance.

THE Ecclesiastical Commissioners mention in their annual report two building schemes of special interest which, though making no charge on their funds, had to be submitted to them for sanction. These relate to alterations and additions to be made in the archiepiscopal residence at Bishopthorpe, and in the episcopal residence at Ripon. It is interesting to note that concurrently the Bishop of Lichfield's house is to be overhauled and improved, as, indeed, it has long needed to be. The Commissioners announce for general purposes an appropriation of £150,000 during the current year, in the following proportions:—£40,000 in meeting benefactions offered in favour of benefices;

OLD HOMESTEAD AT GOMSHALL: SKETCH BY C. IRWIN

£30,000 in endowing Churches in public patronage to which districts have been legally assigned since the census of 1881; £74,000 in meeting local claims, and cases to which the Commissioners are already pledged; and £6,000 in making grants towards the maintenance of assistant curates for poor benefices where the population is not less than 6,000 persons, and where benefactions of not less than £2,000 are forthcoming. The capital value of the moneys given out by the Commissioners now exceeds thirty millions sterling.

ONE of the most wonderful clocks in the World is being exhibited in St. Petersburg. It was originally manufactured for the late Duke Charles of Brunswick, who bequeathed it to the Swiss Confederation. There are no fewer than ninety-five faces to this colossal timepiece. It indicates simultaneously the time of day at thirty different spots of the earth's surface, besides the movement of the earth around the sun, the phases of the moon, the signs of the zodiac, the passage

over the meridian of more than fifty stars of the northern hemisphere, and the date according to the Gregorian, Greek, Mussulman, and Hebrew calendars. So complicated are the works that it took two years to put them together after the clock had been sent in detached pieces from Switzerland to Russia.

DURING the winter months, in which excavation is either difficult or impossible at Jerusalem, Dr. Bliss received the sanction of the Palestine Exploration Committee to undertake a journey to the land of Moab, including the examination of Medeba, Kerak and other places of historical interest beyond the Dead Sea. Dr. Bliss had the special advantage of a letter of recommendation from his Excellency Hamdy Bey, the well-known director of the Museum of Constantinople. He was received most cordially by the Governor of Kerak, and was afforded the fullest permission to measure and make plans of buildings. Dr. Bliss has discovered a previously unknown Roman Fort, and a walled town with Towers and Gates, like the interesting town of M'Shita. The Committee, therefore, appointed Mr. Archibald Campbell Dickie, A.R.I.B.A., to go out and assist Dr. Bliss in the work, and especially in drawing plans and sections, and Mr. Dickie has already arrived in Jerusalem.

A CHICAGO man purposes getting up a spectacle for the coming summer that will be peculiarly Chicagoesque. He expects to lease 100 acres of land in one of the suburbs, and build a railway track thereon. He will buy two engines at an estimated cost of £2,000 a piece. Then he will erect an immense grand stand on each side of the railroad which will accommodate 100,000 people. The engines will be steamed up to their full capacity and started towards each other. The spectacle when they collide, the Chicagoan calculates, will be so thrilling that thousands will want to witness it.

ABOVE the Colonnade of the Exhibition at Venice is a marble frieze surmounted in the centre by a statue of "Glory," modelled by the sculptor Nono. From the Vestibule a central door leads into an octagonal Saloon in the style of the Renaissance, and from this into the Grand Central Hall, the end of which is raised a few steps, and is semi-circular. Two lateral doors in the Vestibule lead into two other splendid Halls.

BUTE House, Petersham, is in course of demolition, and it is understood that the grounds, some twelve acres in extent, and separated from the Petersham Park by a wall, are to be converted into a building estate. If the project be carried out, one of the loveliest rural prospects in the neighbourhood of London will be irretrievably lost. Bute House, which is close to the entrance to Petersham Village, and was formerly the seat of the Marquises of Bute, underwent a vicissitude common enough in the history of spacious old houses, and was for some years occupied as a boarding-school. It is screened from the road by a wall, and at the back looks on an

old-fashioned lawn, beyond which stretches a small park, surrounded by a shrubby walk and flanked to the right by a walled garden. The lease of the demesne having run out, the property was purchased some years ago by Sir John Whittaker Ellis, who has always taken great interest in the prosperity of Richmond; and he is, of course, entitled to let out his copyhold on building leases if he chooses to do so. He explains now that he has received practically no income from it, and appears desirous of making something out of it. At the same time, it is to be hoped that his suggestion that the estate might be acquired by the Commissioners of Woods and Forests—as it could be, he says, on “most liberal terms”—will not be overlooked. “The attention of the authorities,” he adds, “has already been drawn to the value of this property in conjunction with Sudbrook Park, but it is now absolutely necessary that some pressure should be brought to bear; for, although the amount at which it may be dealt with is small compared with the large interests concerned, I can no longer afford to allow the property to remain a dead letter to me.” No one can blame Sir John Whittaker Ellis for coming to this decision. Landowning is not such a profitable pursuit now-a-days that freeholders can afford to be sentimental. It is a matter for regret that the property was not acquired by the Crown for annexation to Richmond Park, and it is to be hoped that the offer of its present owner will be duly considered and, if possible, accepted, so that the land, at least, and the old garden may be added before the whole site be lost.

THE drawings which have gained prizes or medals of merit in the annual competition for the scholarships and exhibitions of the Royal Institute of British Architects have been on view at the Law Library, Liverpool. The exhibition was much stronger in the matter of technical excellence than in originality. This was conspicuous in the drawings made for the Institute's silver medal for measured work and the Pugin Travelling Studentship. The Tite prize for a lake Pavilion in the Classic style; and the Owen Jones Studentship for decorative design, had also called forth some work of high merit, though the labour of detail involved in making some of the drawings must have been enormous. The drawings have been exhibited under the auspices of the Liverpool Architectural Society, being, in accordance with custom, circulated among the allied societies in the chief centres of the provinces.

THE foundation stone of the new Schools of St. George's Parish, Wigan, was laid by Lady Powell, wife of Sir Francis S. Powell, Bart., M.P., on Saturday week. The building is three storeys high, and is to replace the present old mixed schools. Besides a large Central Hall on the ground and first floor, there will be in the basement a large Gymnasium, Cookery Class-rooms and Work-

rooms. The accommodation is for 900 children, and the cost £6,000. Mr. A. Wigan is the builder, the architects being Messrs. Heaton & Ralph, of Wigan.

BENTLEY PRIORY, in Middlesex, is in the market, and will be brought to the hammer towards the end of June. Sir Walter Scott and the poet Rogers were constant visitors at Bentley, and it is believed that “Marmion” and “The Pleasures of Memory” were both written within its peaceful and exhilarating seclusion. The mansion was at one time occupied by the Marquis of Abercorn, and afterwards by Adelaide, the Dowager Queen of England, who died there. The beautiful garden contains a summer house which was a favourite tea room of the Queen.

To facilitate the building operations now in progress in Great George street for new premises for the Institution of Civil Engineers, it has been found desirable to abridge the session, so that before the recess only the special meeting, on the 2nd of May, and the annual general meeting, on the 28th of

THE proposal to set up a bronze statue of Dickens in some public place in London meets with general approbation. Nothing less was to be expected. Dickens' memory continues to be cherished by the English-speaking World. He did not, as has been stated, leave the direct expression of a wish that no statue of his should be erected after his death. He merely said that if his books were not sufficient to keep him in memory no monument would avail. But he does live through his books, which are still extraordinarily popular. It is to be hoped that the scheme of the statue will prevail.

SOME interesting experiments have recently been made by a London firm as to the relative merits of telephonic wires. They prove that on the whole the old copper wires are equal if not superior to the new compound wires with a steel core, and a coating of some other metal. The experiments also tended to prove that telephones can act for a considerable distance when laid down on the soil without insulators. In a field of heavy clay the voice was audible for a mile

and a half. It failed to carry, however, when the wire had been fixed with staples, and thus the plan could hardly be brought into general use, since loose telephone wires would render walking exercise rather dangerous. The trials, though of a rough and ready character, may possibly lead to some changes in the construction of telephone plant, chiefly in the direction of simplicity.

A NEW Church has been erected at the village of Rufforth, near York, through the generosity of Mrs. and the Misses Middlewood, of Rufforth Hall, and was dedicated and opened by the Bishop of Beverley. The edifice which it replaces had become much dilapidated.

The new Church is situated a little to

the north of the site of the old one, and the removal of the latter will permit of the extension of the burial ground. The new Church consists of Nave, and Chancel, and South Aisle, with an accommodation for 180 worshippers. A prominent feature of the exterior is the handsome square Tower (which is surmounted by a Spire), the lower portion of which forms the Vestry, and is placed on the south side. Fragments of interesting work which remained from the old Church have been preserved in the new building. The Late Decorated style has been followed. The walls are faced both inside and out with stone, and the whole of the woodwork (which includes screens, organ case, &c.) is of oak. The main Roof is covered with red tiles, and the main Aisle with the lead off the old Church, which has been re-cast. The East Window is filled with stained glass, and the Chancel pavement is of black and white marble. A new organ has been built by Messrs. Abbott and Smith, of Leeds, from specification by Dr. Naylor, organist of York Minster. On the exterior of the south side of the Tower is the dial of a clock, which was made by Potts and Sons,

BEAUGENCY ON LOIRE: A SKETCH BY FRANK T. BAGGALLAY.

May, will be held, and these at the Royal United Service Institution.

A NEW Technical School and Free Library, erected by the Corporation of Nelson, at a cost of about £10,000, exclusive of the value of the site, have been opened by Sir Philip Magnus. The buildings form a handsome pile in the centre of the town, and will at some future time constitute the south wing of the Municipal buildings. The lending library has accommodation for 20,000 volumes, and at present contains about 6,000. Prior to declaring the Institute open, Alderman Greenwood, chairman of the Technical Instruction Committee of the Town Council, presented to Sir Philip Magnus a suitably inscribed gold key. Sir Philip Magnus, in the course of a speech on technical instruction, stated that the Technical School had been erected not to meet any imaginary wants, for, although it had not been formally opened, there were over 1,000 students in attendance at the School already. Nelson was one of the few towns in the kingdom that had levied a voluntary rate on themselves for the purposes of education.

of Leeds. The whole of the work has been carried out from designs by and under the supervision of the architects, Messrs. Demaine and Brierley, of York. The entire cost of building and furnishing has been defrayed by Mrs. and the Misses Middlewood, in memory of various members of their family, and, in addition, they have given a large sum for an endowment.

At a meeting of the Governors of the Glasgow and West of Scotland Technical College, the Conveners of the Teaching and Staff Committee having directed attention to the success of the courses in Architecture and Building Construction, conducted by Mr. Gourlay, of Glasgow, and having suggested the desirability of recognising this success and strengthening the department by raising the lectureship into a professorship, it was intimated that Mr. Gourlay was willing to devote himself to the work of the department, and to conduct day classes in Architecture. The Governors, therefore, approved of the recommendation to create a Chair of Architecture and Building Construction, and to appoint Mr. Gourlay as its first occupant.

The students attending the Architectural Classes of the Glasgow and West of Scotland Technical College spent a recent afternoon at Glasgow Cathedral, when Professor Gourlay conducted them over the Cathedral, explaining in detail many points which he had referred to in his course of lectures on the Cathedral during the past session. Attention was particularly drawn to the various Renaissance monuments in the Cathedral and Churchyard.

A SHOW of oil paintings by most of those artists—other than the great portraitists—who have assured to Britain a school of its own, is again held at the Dowdeswell Galleries. There are a dozen or two of telling sketches by Constable. A strong note is at once struck by the Old Cromes met with just inside the door. "Sunset—Driving Sheep," is delightfully luminous, peaceful and nature-full. Some of his strength and largeness mark "Carting Timber," by James Stark, whose "Near Cromer" is an excellent example of one who is a master in composition, but whose laborious delineation of foliage so often detracts from his more usual scenes of wooded glades. "Old Windsor," by Bristow, is remarkable for the exquisitely-painted still-life in the foreground. "The Day Before the Fair," by Francis Wheatley, is harmonious and atmospheric; but his Welsh landscapes and other pictures, crude in colour, arouse wonder that he should ever have been much estimated. The spirit of the time is scarcely one for revival of such art as his.

The laying of the foundation-stone of the first Roman Catholic Church in Morecambe was an occasion of deep interest. The Church, which is in Old Poulton, is estimated to cost £3,000, including Sacristies, which are designed to connect to a future Presbytery, and will give accommodation for between 200 and 300. The building will be

of the early Decorated style, massively built of brick, with facings of Yorkshire pierpoints and dressings of Whittle stone. The architects are Messrs. Pugin and Pugin, of London, and the contractor Mr. Charles Walker, of Preston.

WHAT is described as a Model School has been opened at Sefton Park, Liverpool. The School has accommodation for 1,146, and is divided into infants, mixed junior and mixed senior, having separate internal staircases for boys and girls, together with two external staircases from the first floor, and separate exits from the ground floor. In this way each class-room can be emptied independently of any of the other rooms, and ample provision has been made for the escape of the children in case of fire. A swimming bath is placed in the basement; cooking class room, technical workshop, and covered playgrounds are also provided. The style of the building is an adaptation of the Gothic. The dados are of glazed brick, the staircases being also lined with straw coloured brick. Sliding screens are largely used, so as to throw several rooms into one large one when required. The heating is by the low pressure system. The playgrounds are paved

AT BEAUGENCY: BY FRANK T. BAGGALLAY.

with concrete, and surrounded by low coped walls, surmounted by iron railings. The whole of the work has been designed and superintended by the architects, Messrs. T. Mellard Reade and Son, of Liverpool.

MANY well-known people "dropped into Romano's" the other night, when the well-known Strand restaurant was formally reopened after having been rebuilt from designs by Mr. Walter Emden, L.C.C. The building has been considerably enlarged, as the premises adjoining it, formerly in the occupation of a Strand tradesman, have been acquired. There are two entrances from the Strand, the eastern leading to the buffet, and the western to the restaurant. At the dinner, given to celebrate the inauguration of the new building, Mr. Byron Webber presided, and among those present were Sir James Linton, P.R.I., Mr. James Orrock, R.I., Mr. Cecil Howard and Mr. Henniker-Heaton, M.P.

NINE scientific and professional societies sent representatives to the anniversary dinner of the Institution of Mechanical Engineers, held at the Freemasons' Tavern,

under the presidency of Professor Alexander Kennedy. The toast-list appeared to be of formidable length, but brevity was the order of the evening, so that the large company were not detained unduly. Jocularly distinguished the speeches. Professor Ramsay was amusing at the expense of argon, described by Mr. Fletcher Moulton, Q.C., M.P., as a celibate. Helium, Professor Ramsay said, appeared in this respect to be argon's twin brother. They were the "Heavenly Twins," and he was afraid they were bent upon keeping up the celestial tradition as to marriage, although he did not despair of tempting them into the nuptial state, when, naturally, they would become more interesting. Mr. S. B. Bancroft was one of the guests, and he referred to the difficulty experienced by a speaker in facing an audience without the footlights to protect him; for, in his case, they served, as the great fires lighted by travellers in the desert, to keep away wild beasts. Other speakers included Sir H. E. Roscoe, M.P., Dr. Michael Foster (Secretary of the Royal Society), Rear-Admiral H. F. Cleveland, Professor Roberts-Austen, Sir Douglas Galton, and Professor A. W. Rücker. There were also present Sir Richard Webster, Q.C., M.P., Professor Silvanus Thompson, Sir

R. Rawlinson, Sir F. A. Abel, Mr. E. W. Richards, Mr. T. Chatfield Clarke, and Mr. R. E. B. Crompton.

LONG pending has been the amalgamation between the Surveyors' Institute of this country and the Irish Land Agents' Association, the kindred organisation in the sister isle. It is, however, at length on the eve of completion. In consequence mainly of essential differences in law and practice in both countries, many difficulties have had to be faced in the matter, but at a general meeting of the English body a series of amendments and additions to the bye-laws of the Institute will be proposed, and, if approved of, the amalgamation will be accomplished without delay. Con-

sidering that each association is genuinely representative of the landed-interests of its own country, amalgamation, for many reasons, is a strong move.

A LARGE new stalactite cave has been discovered at Hohen-Limburg, in Westphalia. It is said to be in no way inferior to the celebrated Dechen Cave. Its owner has had it explored by an expert, who reports that it contains large arches and colonnades, long alleys and grottos, full of the finest stalactite formations. The most beautiful of these are snow-white "curtains," several yards long and broad. As a considerable part of the cave has not yet been explored, it is possible that it is equal to the Dechen Cave in size as well as in beauty. As in the case of the Dechen Cave, its discovery was due to a mere accident. Some people who were felling a tree noticed a cleft in a rock. They shouted into it, and the prolonged echo betrayed the existence of the cave.

THE Corner Stone of the new Christ Church at Araton, near Bolton, has been laid by Lord Stanley, M.P. The cost will be about £4,000, towards which the late Mr.

J. W. Holden made a bequest of £2,500. It is anticipated that the building will be finished by Easter, 1896. The design is by Mr. R. Knill Freeman, F.R.I.B.A., of Bolton, and is in the Decorated style, the plan embracing Nave, north and south Transepts and Aisles, Chancel, Clergy and Choir Vestries, with Organ Chamber over, on the south side of the Chancel, space being left for a Chapel or Chancel Aisle on the north side when required. The length will be 101 feet, width across Transepts 59 feet 2 inches, and across Aisles 44 feet, the Nave

The Builders' Journal.

MEN WHO BUILD.

No. II.

MR. WILLIAM BLAKE RICHMOND,
A.R.A.

R. W. B. RICHMOND, bred within the pale of conscientious art, developed early in life the ambitions of his father, George Richmond, the Academician. He was born in London two and fifty years ago, and at the extraordinary early age of fourteen obtained two silver medals for design at the Royal Academy. He then commenced to paint portraits, and exhibited them at Burlington House, and began his visits to Italy for purposes of study. Italian Art impressed him deeply; it made him almost a dreamer; and when in 1869—as a young man of only twenty-six—the Academy walls exhibited his "Procession in Honour of Bacchus," he was hailed from all sides as a fine painter of the imaginative school. The study of the antique had done him good; he discovered fields almost untrodden by native artists; he went deeper than the impressions of his modern surroundings for his subjects, and in 1872 he gave us, what some consider to be his finest effort, the "Lament of Ariadne." Upon portraits he was still hard at work, and he has put upon the walls at Piccadilly during the past thirty years some of the finest specimens of portraiture exhibited by the modern English school. Curiously, Mr. Richmond has not brought an atom of his impressionist beliefs into his portrait painting. One would have thought that his love for imaginative subjects would have shewn its trace upon all his canvases; that he could not have kept idealism entirely out. But curiously, and very significantly, has he done so, and steered them entirely free from the daring splendour of Sargeant, the sublimity of Watts, and the piquancy of Shannon. He has been as sober sided as Herkomer and as truthful as Millais.

Mr. Richmond's connection with St. Paul's Cathedral was brought about in this way. When Messrs. Bodley and Garner had completed the sumptuous Reredos which created so much commotion in orthodox circles, Mr. Bodley was desired by the Dean and Chapter to suggest a decorating scheme for the Sanctuary. Had the Reredos never been constructed the extraordinary lack of colour in Wren's masterpiece would not have been so strikingly apparent, but the moment the gorgeous conception of Messrs. Bodley and Garner was unveiled to public gaze, then the decoration of the fabric became a vital fact. Architects remember how Mr. Bodley's scheme of painting the stone and gilding the enrichments utterly failed. The eminent architect requested his friend Richmond to prepare him some "scribbling ideas," and Mr. Richmond, who was then on his way to Sicily, consented. On his return he made some little sketches in pencil to half-inch scale, and by a further request, drew up a scheme for the whole of the Choir. These designs were submitted to the Dean and Chapter, and, upon their approval, Mr. Richmond magnanimously agreed to work upon the decorations ten months out of the twelve for a very moderate income.

Mr. Richmond is following, as far as possible, the instructions left by Sir Christopher to his son, not in the actual design, for all decoration in Wren's time—says the accomplished A.R.A.—was extremely bad. Wren would have given us flying angels, clouds, and curtains, and that sort of thing, whereas Mr. Richmond, as a cultured artist should, believes that the more severe and archaic

the treatment in a Church possessing the fine lines of St. Paul's—and in face of the detail, which is not good—the better the effect.

The first question to decide was the material in which the work should be done. Mr. Richmond maintains that the only material for London is glass mosaic. Fresco and different methods of tempera painting cannot be used with safety; and oil is unsuitable because it blackens, and there is no luminosity in its surfaces. But mosaic is absolutely permanent, and it allows for the introduction of gold and silver, which are all powerful and useful in decoration. The colours which tell best are gold, blue, a pale blue-green, and a dull red. It was thought, if it were possible to obtain English mosaicists, that native artists should do the work, whereupon Mr. Richmond undertook to procure them, or, at worst, to train them himself. It happened that he had seen a little bit of mosaic which had been done for a picture by Holman Hunt, by Powell, of Whitefriars, and Mr. Richmond made an arrangement whereby the men who had actually carried out this work should, with others of their colleagues, be lent to him, and Messrs. Powell were entrusted with the supply of the materials to be used in the mosaic work. The little band of workers were transported to Hammersmith, where, in the gardens of Beavor Lodge, the artist built a special studio for them. For four months he taught

IN THE APSE, ST. PAUL'S.

IN THE APSE, ST. PAUL'S.

them, day after day, how to cut the mosaics and how to lay them. When all was perfect, serious work upon the fabric of the Cathedral itself was attempted by decorating the smaller domes, upon which the Creation of the Birds is represented. Upon that work fourteen men were engaged, and when that was completed, Mr. Richmond designed the ornament and the colouring of surrounding parts. Then the two Clerestories and the three east windows were attacked, and upon these Mr. Richmond largely worked himself.

and Chancel being 21 feet wide. There will be a Porch on the south side, and a door on the north, and a Bell Turret on the Roof. The materials used will be, externally, flat-faced Yorkshire pierpoints, relieved with red Rainhill stone dressings; and internally, Corsham Down bath stone. The Roof will be covered with Welsh slates, and the woodwork to be unvarnished pitch pine. The Church will accommodate 432 persons.

At the Fine Art Society, in one of the smaller galleries, Mr. Ernest George brought together a series of water colours depicting scenes in Tunis, Algeria, and that now fashionable resort of the painter, Tangiers. His sketches were marked by ease, breadth, and a certain daring brilliancy of colour.

THE Isle of Man has lately been exercised about the location of a Pro-Cathedral for the diocese. A bill before the House of Keys provides that until the restoration of the ancient Cathedral Church of St. German, now in ruins, the Chapel of St. Nicholas, at Bishop's Court, may be designated the Pro-Cathedral. There was much variety of opinion expressed at the last sitting of the House, some, it is stated, being in favour of Peel, others of Douglas; but eventually the text of the bill was allowed to remain, so that St. Nicholas Chapel, as containing the Bishop's chair, will remain the Cathedral of Sodor and Man until another is provided.

He prepared full-sized cartoons, and painted a great deal of the windows himself, upon the glass which he selected himself. Then he proceeded to do the figure of Christ at

the end of the two panels, and the Recording Angels. Solomon and David appear on the south side of the Sanctuary, and the Noah and Melchisedek

panels on the east end of the Apse. Whilst this work was slowly proceeding, the orna-

When all is completed—the two bays and window cornices and the windows of the Sanctuary—three years will have been occupied in covering 10,000 square feet of surface, and every inch has been worked out in full-sized detail by Mr. Richmond's own hands. The Duke of Westminster, in addition to his annual subscription to the decorative fund, has undertaken to bear the expense of the two Transept windows, and to these Mr. Richmond will next turn his attention, and it is hoped that this will lead—upon the completion of the Choir—to a vigorous attack being made upon the body of the Cathedral, which no doubt will be devoted to the history of the English Church from the earliest period down to Pre-Reformation times.

Mr. Richmond was at his studio when we called upon him, and welcomed us on our wanderings after the beautiful. His coat and waistcoat were upon a hook instead of upon his back, and the fragrance of a good French briar provided incense to his inspiration. When the Academician first went to Beavor Lodge, green fields surrounded his old-World garden, and the scent of the haw-

vision of an oak case and the formation of a new Vestry, where the organ now stands, in place of the present one situate under the Tower at Worsley Parish Church. The cost of the proposed alterations is estimated at between £250 and £300.

THE foundation stone of the new Church of St. Lawrence, Barton, near Preston, was laid by Viscount Cross, G.C.B., last week. The new building is to cost £5,000, and is to take the place of an older building, practically on the same site, which existed before the Reformation. The late Miss Mary Cross gave £2,000 towards the building of the Church, and the late Mr. Charles Roger Jacson supplemented this with a legacy of £2,500.

IN Greece, excavations will be shortly resumed at Eleusis, and researches will be made in the prehistoric tombs at Cephalonia. At Delphi the French will soon begin work again, as they have received from their Government a sum of 150,000*fr.* for the purpose.

By means of public subscriptions a handsome memorial has just been erected in the Worthing Cemetery to the captain and crew of the steamship *Zadne*, of North Shields, which foundered near there during the terrible gale of November 14th last.

DR. WHITESIDE, Roman Catholic Bishop of

PART OF DESIGN FOR ONE OF THE SAUCER DOMES: "BIRDS."

ment on the barrelled vaulting was commenced. It is gilded, and over the gold is painted a very delicate pattern in blue, so that the gold should not be too fierce, and in order to prevent the bosses from telling so strongly as they would when wholly gilt, the shadows are fitted with white. Fifteen artists were employed on this, and it took them three months to complete it.

At this point in the progress of the work, Mr. Richmond went off to his beloved Italy, and made more special study of mosaics and window painting, visiting once again the beautiful works at Venice and Ravenna, revelling in the glories of Florence and Rome. On his return, the fine mosaic of the Creation of the Fishes was commenced, and the angels filling the pendentive spaces were fixed, and upon this the noble band of operatives is in full labour. The third dome of the Sanctuary will illustrate the Creation of the Beasts, and the whole will then represent the Creation in all its forms and phases—physical, moral and spiritual. The Herald Angels will be seen all down the Church, forming an avenue of great architectural figures, giving motive to the design.

thorn was not unknown; but the wretched builder has embittered his existence and the delights of the charming old house, more charming through the associations of such a man—are hardly intense enough to prevent his flight. Some day, no doubt, the march of commercialism will drive him out of his dear old home, to seek solitude and peace elsewhere.

THE construction of the new Bridge over the river Dee between Queensferry and the Cheshire side, which is to cost £13,000, was commenced last week. Mr. T. K. Irwin, of Hurnsworth-on-Tees, has been appointed clerk of the works. The contractors for the work are the Tee-side Waggon and Engineering Company. The making of the approaches to the Bridge commences in about a week.

THE operative plasterers and labourers in Manchester, Salford, and district are on strike. They demand an increase of wages, and a reduction of what is known as the two miles radius to one mile. The masters offer $\frac{1}{4}$ d. increase, but refuse to concede a one mile limit.

A DESIGN has been submitted for the removal and re-arrangement of the organ and the pro-

Liverpool, laid the foundation stone of the first Roman Catholic Church at Morecambe last week. The new Church is situated in Old Poulton, and is estimated to cost £3,000,

ANGEL OF THE PASSION.

provision being made for the addition of a Presbytery.

ON Wednesday the foundation-stone was laid of a new Oddfellows' Hall for the Cwm-burla district, Swansea, which is to be built at a cost of £1,200, subscribed by philanthropic persons.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Institute was held on Monday evening, April 22nd, Mr. F. C. Penrose, F.R.S., the president, in the chair. Two papers on "The Use and Abuse of Marble for Decorative Purposes," were read, by Professor G. Aitchison, A.R.A., and Mr. William Young, of London and Glasgow.

Professor Aitchison briefly touched upon the various kinds of stone classed as marble, and referred to the distinctive qualities and beauty of that material. The Greeks seemingly chose it mainly on account of the perfection to which it could be worked and the delicate modelling it would express, and the Italians followed in their footsteps. Coloured and variegated marbles were, in high favour among the Romans of the Empire, and enormous quantities were used by them, and every country in the then

and white, dark purple and white, or dark green and white. Black and white for columns, balustrades, and walls had a dignified effect; but in these uses, as in pavements, the white should greatly predominate, or the effect would be too funereal. If an effect of richness, magnificence, or gorgeousness, or of delicacy or loveliness, were required, the same rule, held good in marble as in painting. The Professor then laid down maxims as to the employment of flowered marbles, and recommended for study in their use the Pantheon at Rome, St. Marks at Venice, St. Sophia at Constantinople, the interior of Genoa Cathedral, and other buildings.

Mr. William Young said he should restrict his remarks to the use of marble in interiors. The employment of marble, which had formerly been almost entirely absent from English architecture, had developed enormously in recent years; but was it used to the greatest advantage?

The marble on walls, where solid blocks would be useless waste, should be so treated as to show that it was a lining. Box-marble chimney-pieces, consisting of slabs of marble placed one in front and one on each side, as though to give the appearance of a solid block, were not considered a true use of marble, and not architecture. With regard to the question, "should colour follow form?" the author was of opinion that there was much sound truth in Mr. Ruskin's dictum that colour should be visibly independent of form, although in actual architectural work it was found that colour, as a rule, must follow form.

GREEK LOCKS.

THE lock, called the Lacedemonian, much celebrated by ancient writers, was especially fitted for the inner chambers of houses; the bar fastenings continuing to be

A DESIGN IN THE FORTHCOMING ACADEMY: W. B. RICHMOND, A.R.A.

known World was ransacked for quarries of marble. The marbles used in the Palaces, Churches, &c., of the Dark Ages and Early Mediæval days were mostly plundered from the ancient Roman buildings. The great drawback to the use of flowered marble for columns that bear weight was its liability to flaws and defects, and every shaft should first be tested by the hydraulic press. Marbles mainly formed of carbonate of lime were worse than useless externally, as the polish rapidly perished. The value of marble for decoration was to colour harmoniously by means of a particularly beautiful and specially-coloured material. The finer flowered sorts had in their colouring every sort of motive and caprice that could astonish and charm. Monumental colour was as hard to get as monumental form, and demanded both knowledge and genius. The safest course was to adhere to one colour, or to some strong contrast of two colours, such as black

The true use of marble meant something more than merely lining walls with slabs of that material. As in other materials, the architect should follow a certain order and scheme to bring out his design; the material should be used so as to demonstrate its full effect. The worker revealed the beauties of marble; thought and skill must be added to make it beautiful in architecture. For use in a large way marbles should be few, but well chosen. With three or four different marbles handled by a master there was nothing within the range of architectural art, from simplicity to magnificence, that the architect could not accomplish. It was sometimes exceedingly difficult in selecting marbles for columns and arches, to get the particular type wanted to insure perfect harmony. Columns should be constructive, and not planted on for decoration, and square pillars should be solid marble, and not brick cased with 1-in. marble slabs jointed to imitate solid masonry.

employed for closing the outer doors of dwellings, and the entrance gates to cities. The Lacedemonian lock did not require a hole to be made in the door, for it consisted of a bolt placed in that side of the entrance door which opened, and on the inside of the chamber door. When a person who was outside wished to enter, it was necessary for him to insert the key in a little hole and so to raise the bolt; and, in time, this species of fastening was improved by the insertion of a bolt in an iron frame or rim, permanently attached to the door by a chain, and fastening the door by the insertion of a hasp, through the eye of which was forced the bolt inside the lock, by applying the key. It appears that the locks of the ancients were not of the same construction as ours, not being inserted, or morticed, into the doors; nor even attached, except by a chain, and being, in fact, mere padlocks.

THE RESTORED CRYPT OF ST. ANDREW'S.

LORD BUTE'S EXCAVATIONS.

AT that quaint bit of old Scotland, St. Andrew's, Lord Bute's excavations are now in full swing, but few know of them, save active archaeologists and antiquarians. They are well worth the attention of all architects. Lord Bute is excavating at the east end of St. Andrew's in and about the grounds of the Priory. Nothing seems to have been done in the way of excavation at St. Andrew's till 1879, when a man wheeling his barrow over a heap of rubbish felt the earth give way beneath him, and incontinently disappeared, barrow and all; he had fallen into what is now known locally as the Castle Passage. The place was duly examined and proved to be an undeniable subterranean alley, vaulted and floored by human hands, and running in a straight line from the Castle towards the Cathedral, for a distance of 90 ft.; there it was blocked by the wall of a house. It is provoking to think that in 1879 the house in question had only begun to be built, and that nothing but the anxiety of the builder prevented the passage from being pursued to its natural end. That, no doubt, is in the Cathedral, where some people believe there is a Crypt, but Mr. Hay Fleming, the Scotch archaeologist and the only authority on the matter, thinks there is no Crypt, and scouts the idea of hidden treasure. At any rate, the passage may be explored by any one who does not fear dust. Entering by a wicket of red brick which has been put up under the ivied wall of the Castle, the way descends abruptly at a height of 14 ft. and a breadth of 5 ft., with a groove cut in the rocky floor, until it widens suddenly and falls upon a lower storey. This is reached not without difficulty and a ladder, when the explorer finds himself in a room about 14 ft. broad and 10 ft. high. Passing through this he will come to the foot of a wide staircase cut in the living rock. There are 34 steps, and then comes the obstructing wall. In this room there are stone tables, shelves, and chairs; and worth noticing also are the *culs-de-sac* which diverge from the main passage close to the entrance, one of them going to the length of 21 ft. westwards, the other turning eastward for only 5½ ft.; they are usually explained by the theory that the builders were trying for the nearest way to the Cathedral. The Castle Passage, so fortuitously discovered, remains the only authentic trophy of its kind. Its discovery, of course, set people trying for other subterranean alleys. The Pends Passage was the most notable among these. It was discovered in 1884, when a plumber declared that he had come upon something similar to the Castle Passage 14 years before, when he was laying the gas-pipes of what was then the College Hall. The excavators pierced a road running south of the Priory at the point indicated by the plumber, and in two days' hard work disclosed a most promising and satisfactory passage. They explored it for about 70 ft. from the entrance, but encountered then the wall of the Priory and a vandal—in its proprietor of that day—who sternly forbade them to go further. So the Pends Passage was filled up. Its mystery, however, is dissipated, for Lord Bute's digging within the Priory has proved it to be little better than a drain. The conclusion of the whole matter seems to amount to a strong probability that there are many other passages if they could but be come at. What chance discovered once in the instance of the castle, chance will probably discover again, and considering its history, St. Andrew's may well be honey-combed with such hidden exits and entrances. Lord Bute began to excavate in October, 1893, without, so far as one can gather, any fixed design. He dug first about the site of the Sub-Priory's House, now used as the coal cellars of the Priory, to the extent of 80 feet, but found nothing of any interest. Next he turned to the site of the Refectory, a few steps south of the Priory, having the Cloisters on the north. The Refectory, according to Martine, the murdered Archbishop Sharp's secretary, was 108 feet long. Here the Crypt was laid open with several of its pillars standing upright. Pursuing something like the famous method of Zadig, Lord

Bute has filled in the missing pillars and stones, these and all new buildings being erected in red stone brought for the purpose from Dumfries. Thus the gray stone of mediæval builders and the red stone of those of to-day stand side by side, part of the same whole; and as the old masons' marks are plainly visible on their material, so their descendants have affixed theirs also, to each man's stone his own mark. At one end of the Refectory the remains of a short flight of steps is visible; no doubt it led from the Refectory to an anti-chamber. In the Crypt there are also the remains of a roundel. What was its use? Lord Bute and his architect believe that it may have been a winding staircase, and point to a similar construction in Durham Cathedral. On the other hand, Mr. Logan, the tenant of the Priory, suggests that the roundel may have been built to support an oriel window where the reader would stand during refection. Mr. Logan adds that the roundel at Durham is not properly analogous: that the steps there begin at its lowest point, while there is no trace of a staircase at the foot of the roundel in the Priory. But, of course, these matters are purely conjectural: there is not enough old stone left to determine the point. From the Crypt of the Refectory the way leads next to another chamber. This, too, is vaulted, a cloistered pillar standing in the centre, and a big fire-place stands in one corner. Towards the St. Regulus's Tower stands, still above ground, the ruins of the Prior's House. The doorway is of the architecture of the 15th century, and there are two separate vaultings not communicating. Turning finally towards the south wall of the Cathedral, you come to the remains of the ambulatory Cloister, and of the monks' dormitory.

NEW CHIMES IN THE CITY.

THE CARILLON AT THE ROYAL EXCHANGE.

IN the heart of the City a familiar, though musical, friend, has at last been silenced. After fifty years of wear and tear the machinery of the musical chimes at the Royal Exchange has ceased to act, and pending the substitution of an entirely new and improved system, no old-time airs will issue forth from the tower surmounted by its grasshopper. There are those who will grieve to learn that out of the four tunes to which the chimes have hitherto been limited, two are to be banished. These are "The Old Hundredth" and "The Roast Beef of Old England." Others may shake on learning that "There is nae luck about the house" is to come back again; for it is recorded that in the great fire of 1838, which destroyed the Exchange, the bells were chiming out this ominous melody at the very moment when the Clock Tower fell into the blazing ruins, crushing in its descent the roof of the Entrance Arch. According to the interesting particulars furnished by Mr. White, the Chairman of the Gresham Committee, there will be ample compensation for the two missing tunes; for the new chimes, which are being prepared by Messrs. Gillett & Co., of Croydon, will consist of a patent carillon machine, with three interchangeable barrels, each barrel playing seven tunes, or a total in all of twenty-one tunes, divided as follows: an English barrel, with seven English airs; a Scotch barrel, with seven Scotch airs; and an Irish barrel, with seven Irish airs. There will thus be an English week, a Scotch week, and an Irish week. The airs selected for the "English Week"—beginning on Monday—are: "God Bless the Prince of Wales," "The Bailiff's Daughter," "Rule Britannia," "O Dear, What Can the Matter Be?" "Tom Bowling," "God Save the Queen," and "When I Survey" (Rockingham). For the "Scotch Week" have been chosen: "Auld Lang Syne," "Kelvin Grove," "Keel Row," "Blue Bells of Scotland," "Ye Banks and Braes," "Nae Luck About the Hoose," and "Hanover." Finally, the "Irish Week" will be given up to: "Believe Me if All," "The Minstrel Boy," "The Last Rose of Summer," "Kathleen Mavourneen," "The Harp that Once," "St. Patrick's Day," and "Abide with Me." The hours of chiming will be as at present, that is, nine in the morning, twelve at noon, and six and nine in the evening. The barrels, as will have been seen, are so arranged that on Sunday a sacred tune will always be

played. The tone of the bells will probably be greatly improved, for the dust and dirt of fifty years are to be removed and hammers of greater weight introduced, besides which the new machinery will be much more powerful than the old.

SAWDUST.

THE Glasgow Town Council has decided to build additional tenements on the balcony system in Mason Street and Collins Street. The probable cost is over £9,000.

THE Cold-air Stores, which have been erected by the Manchester Corporation at a cost of £75,000, were formally opened on Tuesday last.

It is proposed to erect a new Volunteer Drill Hall in Eastgate, Barnsley, at a cost of £4,000, but at present only one-half of the expenditure is to be entered upon. The recent bazaar realised £1,200, and there is the sum of £800 promised.

MESSRS. STONES & GRADWELL, of Blackburn, are the architects for the Higher Grade Church of England School at Blackburn, which is being extended at a cost of £2,500. Additional accommodation will be provided for 220 children.

THE new Church Schools at Chevening, near Sevenoaks, which have been built at a cost of £2,300, were recently opened by Sir William Hart Dyke. Earl Stanhope, who presided, contributed £800 towards the object. There was a large attendance.

It is proposed to place a memorial to the late Lord Tennyson at Somersby, Lincolnshire, the birthplace of the Poet Laureate. An organ is to be erected in the Church, and donations may be sent to the rector, the Rev. Dr. A. J. Skrimshire, Bag-Enderby Rectory, Spilsby.

MR. A. CULSHAW, F.R.I.B.A., has been nominated by the Council of the Liverpool Architectural Society for the office of president, in succession to Mr. Henry Hartley, F.R.I.B.A. The annual meeting of the Society will be held on Monday next, May 5th.

THE class for architectural modelling at the Royal Academy Architectural School has terminated for the session, and a series of eight demonstrations will be given by Mr. Stannus, each Thursday evening from 6 to 8, commencing Thursday next, May 2nd, on "Sub-Panelling and Ceiling Design."

THE memorial stones of a new Mission Hall in Valley Road, Meersbrook, Sheffield, as a branch of the Oak Street United Methodist Free Church, have been laid. Seats are to be provided for 350 persons, at an estimated cost of £1,016.

THE work of completion of the great Roman Catholic Church of St. Francis, Glasgow, is being pushed on very rapidly. The Nave was built about 15 years ago from the designs of the Pugins, and now the Chancel and Chapels are being erected under the direction of the same architects, assisted by Brother Patrick.

THERE was last week a threatened strike of the large number of men employed on the construction of the railway from Laxey to the summit of Snaefell. The men have been receiving 18s. a week for 60 hours; they now demand 21s. for 54 hours. The whole of the men came out on strike, but were prevailed upon to go to work pending a decision of the directors.

A NEW Reredos, designed by Mr. James Brooks, V.P.R.I.B.A., has been placed in St. Peter's Church, Hastings. It extends the full width of the sanctuary, about 26 ft., rises to an extreme height of 25 ft., and is, like its surroundings of Early English design, the fabric being of veined and polished alabaster, save the great central cross, which is of grey Derbyshire dove marble, with a border around it of green mottled Cornish serpentine. The nine figures are all in pure white Castelfino marble. The central group represents the Lord crowned as King of kings and vested in the long pontifical robe of a priest, with arms extended, standing in front of, but not nailed to, the cross. Messrs. Harry Hems & Sons, of Exeter, carried out the work.

"THE RELATION OF PAINTING TO ARCHITECTURE."

A PAPER BEFORE THE ARCHITECTURAL ASSOCIATION.

A MEETING of the members was held at 9, Conduit Street, on Friday, Mr. E. W. Mountford (president) in the chair.

The Chairman read the Committee's nominations for the House List for the ensuing season, as follows:—President, Mr. W. D. Caröe, M.A., F.S.A.; Vice-presidents, Messrs. G. H. Fellowes Prynne and F. T. W. Goldsmith; Committee, Messrs. J. Begg, A. Bolton, A. C. B. Booth, A. W. Earle, O. Fleming, C. de Grachey, F. G. F. Hooper, Hon. A. McGarel Hogg, W. B. Hopkins, H. Huntly Gordon, G. A. Lansdown, Theo. Moore, E. W. Mountford, A. B. Pite, H. A. Satchell, W. H. Seth Smith, E. H. Sim, and E. Woodthorpe; Hon. Treasurer, Mr. H. W. Pratt; Hon. Librarian, Mr. J. W. Stonhold; Hon. Secs., Messrs. B. J. Fletcher and A. H. Hart; Hon. Solicitor, W. H. Jamieson; Hon. Assistant Librarians, Messrs. C. H. Freeman and E. W. H. Wonnacott; Hon. Auditors, Messrs. E. H. Sim and G. W. Buss, and Assistant Sec. and Registrar, Mr. D. G. Driver.

Mr. C. W. Whall then read a lengthy but highly interesting paper under this head. He said the question of the relation of painting to architecture was the question of the relation of all the other arts to architecture; and, therefore, remembering their definition of art, all crafts, however humble, which set before themselves the pursuit of beauty. He thought it would be useful before turning their attention to so complicated a thing as painting to spend a few minutes in looking at the question in a simple form, by considering one of the lesser crafts over which architecture extended its direction. He instanced iron-work, and asked them to consider how completely the virtue proper to each of its two great processes governed the design and decided its relation to architecture, both as to pattern and place. He advocated the learning by all architects of a craft so as to bring them more in sympathy with the crafts. With regard to painting, he expressed his firm conviction that the one great peculiar characteristic virtue pertaining to the art was the definition and exquisite laying on of paint. Small, simple, half-contemptible as this might seem, it was the only key to the study of the art of painting; and he directed their keenest attention to it in order that they might be able to search for this quality in pictures, and know it when they found it. He quoted in some detail Veronese's "St. Helena," in the National Gallery. The peculiar virtue of sculpture was noble form, as that of painting was splendid colour. In painting it was that swift sensitiveness of touch which he had tried to describe in Veronese, and in sculpture the same thing was true. He insisted strongly on technical skill, and said a work of art which appealed for manifest technical shortcomings to the lamely-expressed goodness of its purpose, damaged more than aught else could do the cause it pretended to advocate. He illustrated the resources of painting by a series of tints, and gave examples of the effects to be obtained by the varied handling of one colour (burnt umber), and white. He strongly advocated the working in a given key, and when they had a mansion or a church to decorate, they must tell the artist what keys of colour would harmonise with their intentions, and what pigments he might use. They must remind him that they were masters of the situation, and that he must do as he was told. They would thus get some valuable, or, at any rate, emphatic information on the relationship between painting and architecture. The arts were seeking to found themselves on the fine forms of craftsmanship proper to each, rather than on academic theories and vague forms of dreaming. The tendency of the arts at present was to specialise themselves, and though it might be feared that it was their tendency also on that account to isolate themselves, the conviction was growing that in the searching after the special and individual excellencies of each, craft was being, in reality, discovered, and proper ground on which they could all unite. Architects by their study of the noble art which they had chosen to be

their life's work, were preparing to stand in the place where, by the nature of things, all those various arts rapidly coming together must meet. They met in virtue of their common motive—beauty, and their common passport to that enchanted ground was craftsmanship. This age had been too much swamped and stifled by academic methods of study, and it was certain, that for a long time yet, much instruction must be given in this way, yet he urged on them all to take every chance that offered of learning at the bench or on the scaffold, at the anvil or at the easel. Turning to the field of modern painting, he said cabinet pictures, he was happy to tell them, were a drug in the market, and very soon all the jarring schools would be clamouring round architects for employment. Indeed, if he lived for another twenty years he should expect and thankfully rejoice to see architecture the acknowledged leader, ruler, and guide of all the arts in this country. He reminded them that old forms of painting were being much challenged now; new forms were being started and people were liable to be carried away by the new as the only right thing. They were afraid of being called "old-fashioned" if they do not. The doing of a difficult thing was not a work of art. The Forth Bridge was the greatest triumph over difficulty that the science of building had ever gained, but it was not a work of art, simply because it was built without a thought of beauty, and because it was not beautiful. He referred to what he described as the "lamentable divorce between the sister arts," which had left the cabinet picture to become the isolated and irresponsible thing it had, and which must sink into the position of a counter in the speculations of the market rigging and conscienceless dealer. The reason why he was happy to tell them of the decline of the cabinet picture was not his objection to cabinet pictures as such, but only as the spirit of the age had made them. It was for architects to help them by taking a lively interest in the union of arts in which lay all their future hope, and by showing them the possibility of surrounding themselves with beautiful things generally to make it impossible for the beautiful plant of Art to make its only failure in that which was the crown and flower of all, by painting, which so lamentably missed its mark. Painters as a rule had valued skill and technique in proportion as they were seekers after beauty; and he named Burne-Jones, Watts, Albert Moore, Leighton and Whistler, as the very men amongst painters best fitted to associate themselves with architectural art in the capacity of decorators, for in truth they were seekers after beauty. Let them not imagine that all he meant by "decorative" was the art which was usually now alluded to under that name. All the finest art was decorative, Veronese no less than Giotto, and what could be more reposeful and perfect and "liveable" than an eighteenth century room, with the rich warmth of Reynolds and the severe grace of Gainsborough amongst its slender mouldings and its dainty white and gold. He did not want them to seek for art that was very flat, with a brown outline round the faces, and with no shadows; but what he did urge them to seek for was art where beauty has been the aim before realism, glorious colour before deceptive light and shade, and graciousness, sweetness, dignity and repose before dramatic fervour, show, excitement, and fuss. Upon architects fell the honourable but responsible task of directing the accessory arts, and it was with a real joy that painters saw so many of them now seriously setting themselves to learn them. They would find, in doing so, even if they only learnt one, the grounds for a sympathy with their brothers in art to which they had hitherto been strangers. And depend upon it, said Mr. Whall, when masonry, when timber and glass and metal and mosaic and sculpture and painting, were each advanced to their own proper perfection and completion; and when being so, they were brought under the direction of a master builder whose knowledge of, and sympathy with, their various excellences had largely helped to make them what they were, they would soon cease to hear that painters had "no style." If once the various crafts were used in perfection and used in association they would soon form their own right style,

and being used in sympathy also they would combine to form one harmonious style for the whole range of the arts. Speaking generally, he ventured to think that their past history showed that the arts had ever attained the highest perfection of all, when, even beyond the attainment of physical beauty, they recognised yet another motive still, and referred all their efforts to the standard of a high and noble conception of the whole of human life, domestic, civic, patriotic, and religious in its completeness and its dignity. The lecture concluded with the following words: "You builders of our temples and our halls and our homes, you students of our ancient glories, help us to recover that lost inheritance. When you apply to us to join with you in your efforts, do so in this spirit, and let us together apply whatever we can win back of the felicities and dexterities of our noble arts, in portrayal of things worthy of them—the great verities of life and being, in the reiteration of the unchanging voice of human aspiration, the affections of the heart that never grow cold, the thoughts that never die. I have put before you two things—the technical and the ideal. Both necessary. The one is fine art, the other is fine life."

Mr. Halsey Ricardo said Mr. Whall had laid great stress on the pursuit of beauty, but he thought it required a little caution. If they deliberately went for beauty, they might get a sort of beauty, but the standard and area of beauty were always changing and becoming enlarged and modified. A very fine piece of fresh work added something to the appreciation of beauty, but beauty should not be foremost in a man's mind. With regard to the question of technique, Albert Moore went deliberately and steadily for beauty and technique, and it had had the result of making his girls look very sleepy, who began the morning with toffee and caramels, and did not know what to do with themselves. On the other hand, they could have pictures pitched in too high a key, and they were exhausting. He had very great pleasure in moving a vote of thanks to Mr. Whall for his interesting paper, but he should just like to supplement it with the idea that beauty and technique were intolerable in themselves, and that they should not be pursued for themselves directly.

Mr. Statham said he thought that the paper, with which he agreed entirely in sentiment, had taken rather an exclusive view of painting as a decorative adjunct to architecture. When they did use it as such, they must architecturalise it, not only in line, but in subject and expression. He did not agree with Mr. Whall that the cabinet painting was dead. It seemed to him that there was something to be put into a painting which they could put into a cabinet picture and which they could not put so well into an architectural painting. An artistic fallacy which had been very much accentuated lately was that the only object of a picture was its decorative object; and one result of that was that painters were losing the power of indicating character in the way they used to do. He thought artists were in danger at the present day in the pursuit of pure beauty of losing what after all was a still higher function of painting, i.e. giving them an intellectual idea—one sprung from the artist's brain; or else giving them a new and vivid idea of some feature. That was where he thought they all failed now, except Mr. Orchardson, whose pictures were works of art and criticism of life. Given a picture in which they were entirely free from any necessity of considering the surroundings, there ought to be something with an insight of human life in it, and that really went higher than merely decorative work. Where they had to work upon a wall, they must consider that beauty of line was the first thing, and that human character must be a little kept in the background in order to give the repose necessary to harmonise with the architecture.

Mr. Pryor said the last two speakers had thrown a film of doubt over Mr. Whall's propositions, which, he thought, was largely due to their adaptation of the word "beauty." It seemed to him that Mr. Whall had given them an Architectural treat. He thought the purpose of his definition of the art of painting was that its sphere lay in the noblest emotions, and that it did not lie in the sphere of intellect,

and that for a painting to be a permanent work of art, it was necessary to appeal to the noblest emotions. He did not think that art could claim to be the mother of arts.

Mr. Fellowes-Pryne seconded the vote of thanks and said he thought there was just one little remark which might be added to Mr. Whall's, and that was as to having suggestions from a painter's point of view as to the application of decoration to architecture. He thought they could not but feel that much of the shyness the public had in taking advice from a painter or an architect for decorative work in churches and large buildings, was because of the failures which existed and which were caused principally, he thought, through the lack of knowledge of the architects and want of knowledge of the way colours contrasted and harmonised with one another. He agreed with Mr. Whall's idea of making rough models of their plans, so as to see all round the subject. The more architects got into touch with painters and the more painters got into touch with the architects, the more likely were they both to succeed in the future.

Mr. Whall, in reply to the whole discussion, said he did not think paintings with high ideals were exhausting, but, on the contrary, that they were stimulating. In dwelling upon the necessity of technique, he was only speaking of it as a necessary to the ideal perfection of painting, but still, pictures might have a great charm without rising to that standard.

The motion having been carried, the meeting terminated.

THE CENTRAL HIGHER SCHOOLS, SHEFFIELD.

NEW BUILDINGS.

LAST Friday evening, Sir George W. Kekewich, K.C.B., the Secretary of the Education Department, opened the new buildings which have been erected in connection with the Central Higher Schools, Sheffield. The Central School was opened by Earl Spencer in 1880, and, including the adjacent Bow Street Elementary School, was designed by the late Mr. J. B. Mitchell-Withers, architect. Since his death, the work has been completed under the direction of his son, Mr. J. B. Mitchell-Withers. The architecture is of the Italian Renaissance style, carried out in harmony with the adjoining buildings. The accommodation provided comprises, on the ground floor, machine-drawing room for 131 students, with adjoining lecture room for 72 students. On the same floor also are the physical laboratory and lecture room adjoining, for 50 students. The first floor is devoted to chemistry, and the fine laboratory, with open timber-roof, is subdivided by glazed screens, for 72 "elementary," 54 "advanced," and 12 "honours" students. Opening from the "advanced" laboratory is the balance room, with substantial stone tables. The laboratories are fitted with the latest type of benches, with sinks, gas and water supplies, and fume closets on the benches. Larger fume and draught closets are provided along the side walls, with glazed cupboards, for reagents. The chemical lecture room provides accommodation for 100 students, and has adequate preparation, teachers, and dark rooms opening out of same. In the basement (only partly below the ground) provision is made for wood and metal work shops, and adjoining are the engines and dynamos for electric lighting, ventilation, and provision of power for machinery. On this floor, also, are the boys' dining rooms, and the department where instruction in laundry work will be given. The heating is by hot air passed through a fine water spray and wet screens, and driven by powerful fans through air ducts to the various portions of the buildings, where its admission to the different rooms can be regulated. The whole School is well lighted by electricity, which has been carried out under the direction of Professor Watkinson, of the Glasgow Technical College, who has paid special attention to the plant being suitable for teaching purposes.

It has been decided to purchase the Longfield House Estate, near the present chapel, in Hammerton Street, Pudsey, for £1,150, as a site for the proposed new Primitive Methodist Chapel.

LONDON AND PARIS.

AN ART COMPARISON.

NO one, with full knowledge, ever thinks of maintaining that London can compare with Paris, not merely in painting but in sculpture and the arts of decoration. Acres of painting are produced for every Royal Academy, but the canvases which are tolerable, even by our standards of excellence, are few. With us, as with the French, there is fortunately an originality which has revolted against the banality and narrowness of the reigning clique. But its energies, whether we take the New Gallery, or the Grosvenor, or the New English Art Club, are very modest in comparison with the splendid exhibition of master-work at the Champ de Mars, and its unrest, in its wildest moments, falls far short of the splendid madness which has made the "pointellistes" and the "tachistes" of Paris the discoverers of a new realm. This pre-eminence of the French capital is the more extraordinary because a very large proportion of its good work is done by foreigners, and some of the best is done by artists of English speech. The keenest spirits of the United States, the young members of the notable Scottish school, and not a few of the cleverest English artists, have made their home in the "City of Light." Like Mr. Whistler, they learn all that the French tradition of high craftsmanship can teach them, and they add to it a certain strenuous character which the French critics themselves welcome as a healthy and a powerful influence. The number of really French painters of the first rank who are now exhibiting in the Champ de Mars is equalled or perhaps exceeded by the number of foreign names acknowledged even in Paris to be eminent. Whistler himself does not exhibit, but Sir E. Burne-Jones has sent a portrait which, for a certain sobriety of tone, is better work than for a long time, and Mr. Stott, of Oldham, sends two clever things. The Scottish school of portraits is admirably represented by Mr. Guthrie's most convincing personalities and by Mr. Lavery's portraits of ladies. America yields Mr. Alexander's essays in another branch of the Whistlerian manner, Mr. Rolshoven's strong work, and Mr. Shannon's remarkable "pianist." In work other than portraiture, the United States can take credit for Mr. Dannat as a colourist, for Mr. Lucas and his masterly nudes, for Mr. Alexander Harrison's always interesting studies of dark seas and waters, for Mrs. Lee Robbins's tricky graces, and for many more. Craftsmanship in art has reached such a height in the Parisian schools that a standard of technical excellence, which is very rare in London, is all but universal at the Champ de Mars. The crude work to be found in every Royal Academy seems incredible to anyone who walks with a discerning eye through the rooms where the spirit of M. Puvis and M. Dagnan, the inspiring legacy of Bastien Lepage have left their effect. Why should Paris be so full of strong effort and high attainment, and London on the whole so barren of all but the commonplace in painting? Surely the remuneration of the painter is far greater here. The nation and the city in France are patrons of art on a great scale, and though the individual prices they pay are notoriously small, they are enhanced by the knowledge that the selection is almost always made on competent artistic advice. At the same time, any artist, even the youngest or the most original, who does eminent work, leaps at once to a position of dignity and honour. With us, public patronage and recognition is neither generous nor well bestowed. Private patrons spend immense sums, but the result is rather to debase art than to stimulate it, and the effect is to turn some of those who might be our masters into mechanical and meretricious tradesmen. The evil is not merely a question of the studio and the salon; it affects the whole national life. We are the poorer in all our thought and character, the grosser in our aims, the narrower in our judgments, for lack of some of this serious effort after beauty.

THE Harrogate Town Council has decided to proceed at once with the erection of a new pump-room for supplying the magnesia and some of the chalybeate waters.

THE GUILDHALL PICTURES.

MANY fine works are to be found in the Loan Collection of Pictures at the Guildhall Art Gallery. They will afford pleasure to connoisseurs, as much as to busy City men. The large room contains important pictures by English artists, of whom all but O'Neil and Vicat Cole are still living. In the second room are pictures of earlier execution by existing artists, by some deceased British painters, and four examples of Mons. Gérôme's art. The third room—richest of all—is occupied by exceptionally fine Dutch works, if we leave out of account two not very alluring Sir Joshua's. There are not, perhaps, many strangers even in the Flemish section, as Lord Northbrook's almost incomparable Metsu, "The Intruder," and his no less extraordinary Jan Steen, "Portrait of the Artist," were at the Old Masters in 1889, while the Queen's splendid Metsu, "The Violoncello Player," was there in 1876 and again in 1893. But her Majesty's Jan Van der Meer (or more correctly, Vermeer), of Delft—that very rare master—is all the more welcome that it permits comparison with the Vermeer acquired by the nation two years ago, not much to the disadvantage of that in Trafalgar square. Earl Spencer contributes his magnificent Rembrandt, "Portrait of Rembrandt's Mother." There are two brilliant Terburgs, the one owned by Mr. W. Harvey being specially notable for all Terburg's virtues, although his social subjects are ordinarily of higher class life than this "Sleeping Soldier" being "tickled with a straw." A little Gerard Dow, lent by Sir Francis Cook, is "An Old Woman," capital for its flesh painting, finish, and transparency. These are but a few of the best, for the Dutch room is rich in *genre*, in portraits and in landscape. It is scarcely invidious to the rest to assert that "Orlando Pursuing the Fata Morgana," by Mr. G. F. Watts, is the jewel of the first gallery. It is lent by the Corporation of Leicester, and seems to have become even richer in colour since it was at the New Gallery five years ago. Neither Mr. H. W. B. Davis nor Mr. Val Prinsep is often seen at so high a level as in "In Ross-shire" and "At the Golden Gate," both of which were at the Royal Academy the same year. That landscape, by Sir John Millais, "Over the Hills and Far Away," which is so well known by an etching of it, is now well nigh a score of years old, but still more interesting are his figure pictures of a decade earlier—"Jephthah," lent by Lord Armstrong, and "Rosalind and Celia"—though it would appear as if Sir John had painted the bole and roots of a beech tree, but scattered its dead leaves as oak. Sir Frederick Leighton is best represented by that wonderfully beautiful design and colour harmony, "The Garden of the Hesperides."

THE Government has approved the plans for rebuilding the Old Bailey, and steps will shortly be taken to carry the plans into effect.

At a meeting of the committee of the Carlyle's House Purchase Fund, held on Wednesday at the British Museum, it was announced that the amount subscribed or promised, after deducting sundry expenses paid, was £1,722. The committee hoped to be in a position to complete the purchase and carry out indispensable repairs next month, so that the house might be opened in June.

At the meeting of the Mersey Docks and Harbour Board on Friday last, it was decided to fill up a portion of the water space on the south side of Stanley Dock and build thereon additional warehouse accommodation for the storage of tobacco at a cost not exceeding £170,000. In the discussion particulars were given of the tremendous increase in the tobacco trade during the past few years.

THE new School buildings erected at King's Heath for the King's Norton School Board, at a cost of £5,633, were opened last week. A new junior mixed School or fourth department has been provided adjacent to the late infants' School, which has been transferred to the mixed juniors, the infants being provided for by the erection of a new infants' School fronting to Institute Road. The work has been carried out from the designs and under the supervision of Mr. Edward Holmes, architect, and by Mr. R. Merton Hughes, contractor.

BIRMINGHAM'S NEW HOSPITAL.

"ONE OF THE FINEST IN THE KINGDOM."

GREAT satisfaction has been expressed by those who have been over the new Small-pox Hospital, erected and furnished at Little Bromwich at a cost of something like £41,000, to serve Birmingham. The City Council held an official inspection, and found the Local Government Board's high tribute thoroughly justified. The new institution stands on a site about 24 acres in extent. The buildings, both for the patients and the administrative department, are divided into well-separated blocks, and have been erected of red and blue bricks, with red tiles, without any special attempt to achieve an architectural effect. On passing through the gates, immediately on the right is the entrance lodge, a red brick building relieved with stone, with half-timbered gables and a covered porch and vestibule communicating on one side with a reception room for visitors or others making enquiries, and on the other with the porter's residence. The receiving ward, which is the first of the Hospital buildings, consists of a single room, with a bath-room leading therefrom, and a small enclosed yard and offices. Here the patients are examined and stripped of their clothing, which is sent to the disinfecting station to be purified before being placed in the store connected with the discharging ward. The patients are then either taken direct into one of the pavilions to undergo treatment, or, if any doubt exists as to the nature of the case, they are placed in the isolation or quarantine pavilion, and kept there for further observation. The isolation pavilion, situated on a bye-road, is arranged for males and females, and consists of a number of small wards with one, two or three beds in each as required, and access to each ward is obtained from the open air, but under a covered glass verandah. Special bathing and other sanitary arrangements are made, all securing perfect isolation. The official and administrative block is sub-divided into three sections, the central containing the medical quarters and matron's apartments; the left section the steward's apartment and stores, mess room, kitchen and kitchen yard; and the right section the servants' accommodation and recreation room, the matron's stores and the official laundry. The various departments are admirably arranged, so that whether stores, food, or medicines are required, they can be delivered from the lobbies to the attendants or nurses without it being necessary for them to enter the building. The pavilions for the patients are four in number, and each consists of two wards, 72 ft. by 30 ft., providing accommodation for 24 beds, and allowing air space to each patient of over 2,000 cubic feet. At the ends of the wards are the bath-rooms and lavatories, and the wards are connected by an entrance hall, with a duty-room overlooking each ward, pantry, store-rooms, &c. Ample provision has been made for the servants by the erection of cottages; at the extreme rear of the site is the laundry and disinfecting yard with incinerator, perfect isolation being preserved all through; and the discharging ward, a small two-storied block, stands near the lodge at the entrance. The Hospital is complete in its equipment, even to the minutest detail, and the Committee not only have an institution which the Local Government Board say is one of the finest in the kingdom, but a Hospital standing in so healthy a district that, instead of remaining on the average six and a half weeks, as formerly, it is believed the period of a patient's detention will be reduced by at least a week.

The foundation-stone of the new Church of St. Lawrence, Barton, near Preston, has been laid by Viscount Cross, G.C.B., and the new building, which is to be erected at a cost of £5,000, is to take the place of an older building, practically on the same site, which existed before the Reformation, and of which mention was made in 1577.

It is proposed to erect a Boys' School and a Social Club and Institute in connection with St. Augustine's, Monsall. The buildings, which are expected to cost about £3,000, are to be constructed upon a plot of land near the Church, presented for the purpose by the Dean and Canons of Manchester.

THE SANITARY CONFERENCE AT MANCHESTER.

ARTISANS DWELLINGS: THE LIGHTING AND SANITATION OF ELEMENTARY SCHOOLS.

A THREE days' Conference on Sanitary Progress and Reform, was held at Manchester, on Wednesday, Thursday, and Friday of last week. Sir H. E. Roscoe, M.P., presided, in the absence of Sir Henry Rawlinson, late chief engineer to the Local Government Board, who should have delivered the inaugural address, but whose indifferent health prevented his being present.

On Wednesday many papers were read, some of a purely sanitary nature. Smoke abatement came in for much discussion, being very much needed in Manchester.

Speaking on artisans dwellings, Mr. Walton Smith remarked that he knew they were high, and he knew the difficulty and inconvenience experienced by aged people and small children in ascending the steps to the higher storeys. That condition of things, however, arose out of the operations of the Local Government Board. When the Manchester Corporation approached the Board with respect to the areas which were declared to be insanitary they were obliged by the Local Government Board, where they removed insanitary property, to provide proper accommodation for the number of persons who were displaced. They could not, as would be seen, accommodate the same number of persons on, say, two acres of ground that was previously overcrowded, and where the death-rate went up as high as 50 per thousand, giving each proper breathing space, without increasing the number of storeys in which those people were to be located. The people who resided in the buildings did not grumble. He had personally made inquiries from the residents, and found that they were satisfied. The number of occupants was increasing; but he should be glad if, in the future, they could make some arrangements whereby buildings of such a height could be avoided. On the Sanitation of Elementary Schools, Dr. G. H. Bailey (Owens College) described the results of examinations of the air of certain elementary Board Schools in Manchester, and Salford, facilities having been granted by the respective School Boards for making the necessary observations. Although the weather when he made his observations was such that the windows could be kept open the whole of the school time and were so kept open, he found, even in the large rooms at Webster Street and Grecian Street School, which were the most favourably circumstanced, there was a very distinct odour, whilst in the classrooms the air was very oppressive, giving rise to headache when it had to be endured for a period of half an hour together. At Lloyd Street, St. Stephen's, and Granby Row, matters were distinctly worse; the excess of carbonic acid gas was as a rule 12 to 15 in 10,000, and the odour, in the classrooms especially, simply unbearable. On dull, moist days the temperature within and without was practically identical, and hence there was a very limited circulation; the air was then worse than on fine, clear days. On such days the odour was very pronounced. It was clear that even under favourable conditions the fresh air supply was too limited. Mr. E. Hewitt followed with a paper on the systems of warming and ventilation of schools, and Mr. W. Spinks (Yorkshire College, Leeds) contributed one on the drainage and general sanitary arrangement of schools. Dr. Emrys Jones then read a paper on the lighting of schools. He said that taking the schools in Manchester and Salford of all kinds and classes, he had no hesitation in saying that not 5 per cent. of them would stand a most moderate test of efficiency in the question of lighting. Many of them seem to have been built without the slightest regard to the use to be made of them for the instruction of young growing children. The principal evils arising from this condition of things were short sight, weak sight, and spinal curvature. Dr. Jones quoted from the investigations of Dr. Cohn, of Breslau, Professor Pflüger, and other authorities who had investigated the subject to show the great evils arising from the neglect of proper pre-

cautions as to the lighting of schools. He said instances might be indefinitely multiplied of the grossest violation of the simplest rudiments of hygienic laws and yet our children were forced to attend and be "educated"—he must be pardoned for using the term—under such conditions. It was surely time that an intelligent democracy should see the absolute futility of making the election of those responsible for school management a question of politics or of whether a candidate was for Church or Chapel. What was wanted was to find intelligent men who appreciated and understood the laws of health, and who, at all costs, would see that they were applied. All the best authorities were agreed that the best aspect for windows was east or west. He urged the adoption of the electric light in schools.

At the Conference on Thursday, one section was devoted to indoor and outdoor recreation, and another to woman's work in sanitary reform. There was also as a part of the gathering the opening of a Conference of District Councils for the Registration of Plumbers in the Northern and Midland Counties. The Conference on recreation was presided over by Mr. Herbert Philips. The Earl of Meath sent an interesting paper on open spaces, and Cardinal Vaughan sent a paper on "The need of winter recreation halls for the poorest localities." His Eminence said the fact that the local authorities had the power to provide elevating amusements and pleasures out of the rates showed that the bearing of these things on the health, comfort, civilisation, and moral welfare of the people had been duly recognised by law, as well as by common-sense. He suggested, as a tentative proposal, that somewhere within reach of the poorest quarters of one of our great cities, the civil authorities should build or provide space for a large winter garden or winter recreation hall, capable of accommodating 500 to 1,000 people, and that in this area, well heated and lighted, music and entertainments should be organised on certain evenings of the week.

At the closing session, on Friday, Sir B. W. Richardson delivered an address on the sanitation of the past, with ideals for the future. Having traced the advance of sanitary science that had marked the last fifty years, he said his first ideal was a national main drainage system, together with a better system for the disposal of refuse. In connection with the management of the sick, he advocated the universal provision of hotel hospitals, the use of which would obviate the necessity for the treatment of the sick at home. He developed an elaborate scheme for the ventilation of towns, the purification of the atmosphere, the acquisition of pure water, and reform in the matter of food supply. With regard to the disposal of the dead, he expressed himself as being favourable to cremation, and thought that, at all events, it ought to be supported. He insisted that sanitation should become the first part of the national learning. Education in the first principles, he said, demanded the fulfilment of all details. He did not mean education as the word was generally understood, but education in the laws of life and organisation, and in those secondary forces which we called social and economical.

A BLOCK of Municipal Buildings is being erected at Holywell for the use of the Urban District Council. Mr. Lloyd Williams, of Denbigh, is the architect, and Mr. Abel Jones, of Rhyl, is the contractor.

A SCHEME has been drawn up for the establishment of a county Museum for Lincolnshire. A Lincolnshire Naturalists' Union has been formed and a county herbarian brought together. To carry out the scheme £25,000 will be required—£5,000 for the building and appliances, and £20,000 for the endowment fund.

THE Duke of Devonshire has contributed £100 towards the fund for the Restoration of Whittington Parish Church, near Chesterfield. Plans have been prepared by Messrs. Rollinson & Son, of Chesterfield, for restoring the structure. It is proposed to reduce the accommodation from 650 to 375 sittings, other alterations being effected during the restoration.

Trade and Commerce.

We shall be glad to receive copies of catalogues from firms engaged in the allied building trades. These will be carefully looked through, any novelty noted, and—should its nature seem to demand it—fuller attention drawn thereto. We are particularly wishful to secure the friendly interest of designers and artificers in *THE BUILDERS' JOURNAL*, and, now and then, we might see our way to reproduce an outline sketch or illustration of any contrivance that struck us as being new or needed. Building covers up—figuratively, and in fact—so much ground, and we mean to cover the whole of it.

We should be further obliged if firms would indicate, by some suitable mark, the pages in their catalogues to which they would in particular, desire to call our attention.

Clark Memorial Hall, Paisley.—The Mission Hall in connection with Thread Street U.P. Church, Paisley, has been enlarged and was opened on the 21st inst. The Hall is lighted by fourteen long windows, and these have been filled with stained-glass by Messrs. Stephen Adam & Son, Glasgow, and is seated to accommodate about 450 people, and heated by hot water pipes. The elevation from the street is two stories in height, and the style of architecture is in harmony with the adjoining Church. Part of the lower story is utilised as a manager's room and session-house, each room being about 18 feet square, with lavatory accommodation connected; while the upper flat has been arranged as a house for the church officer. The contractors were:—Builder, Mr. George Henderson; slater, Mr. Charles Wallace; joiner, Mr. James Dunlop; plasterers, Messrs. John Fraser & Co.; painters, Messrs. Cowan & Stewart; gasfitters, Messrs. George Robertson & Son—all of Paisley. Mr. James Donald, of Paisley, was the architect.

Balmoral Hotel, Edinburgh.—Extensive additions and alterations have recently been made at this building, consisting of a very fine new dining-room, 55 by 53 feet, assembly or dining-room, 58 by 27 feet, writing-room, thirty visitors' and ten servants' bedrooms, lavatories, remodelled kitchen and serving rooms, new American "Otis" Elevator, remodelled bar and restaurant, &c. The work has cost over £9,000, and has been carried out by Mr. J. Macintyre Henry, architect, Edinburgh.

New Board Schools in Wales.—Two Board Schools, one at Pontypool the other at Cwmffrwdor, have been opened by the Trevathin School Board. Both Schools were built from designs by Mr. E. A. Lansdowne, of Newport, Mon., and cost about £10,000. That at Pontypool, which is Gothic in style, is built of blue Pennant stone sills with buff brick dressings and Bath stone, and corbels. The large room is 89 ft. by 20 ft., and the infant-room, 21 ft. by 18 ft. The builders are, Messrs. Morgans & Evans. The School at Cwmffrwdor is also built of blue Pennant stone, and is designed class-room fashion, with glazed doors, so that the whole of the rooms are visible from one point. The builder was Mr. A. H. Bailey, Pontnewynydd.

Diary and Directory, for the use of Surveyors, Auctioneers, Land and Estate Agents.—A well-arranged volume, providing a diary of one page for every day, ruled pages for cash account. There are directories of members of the Surveyors' Institution, the Auctioneers' Institute, of county surveyors, principal bill-posters, and an auctioneers' land and estate agents' directory for London and the provinces. Also an abstract of Acts of Parliament and an account of local customs in England and Wales as to land tenure, &c. Besides this there is a mass of carefully-selected information and tables of special interest to all in any way connected with land and house property. London: *Estates Gazette* Offices, St. Bride Street, E.C.

Oldacres & Co.—Where to get a number of copies of Bills of Quantities, Specifications, &c., at a reasonable price, has always been a

question with architects and surveyors. Lithography (and similar methods) is expensive, but we can recommend the work executed by Messrs. Oldacres, of 59, Chancery Lane. The cost is 50 per cent. cheaper, and the efficiency is proved by the large amount of work they always have in hand.

SOCIETY MEETINGS.

Liverpool Ruskin Society.—The last general meeting of this society for the present session was held on the 22nd instant in the Free Library, William Brown Street, and, despite the unfavourable weather, was pretty numerous attended. Mr. E. J. Baillie, the president, occupied the chair, and the feature of the evening was a paper read by Mr. Conrad Dressler, its subject being "The Curse of Machinery," in which the author endeavoured to set forth the ugliness, from an artistic point of view, brought about by machinery without corresponding advantages. The paper, which was a repetition of one read to the Birkenhead Literary Society in January last, seemed to be much appreciated.

The Society of Architects.—A special general meeting of this society was held at St. James' Hall on Tuesday evening last, the president, Mr. E. J. Hamilton, being in the chair. It was resolved after some discussion that the list of examinations recommended by the Council be accepted as alternative, either wholly or in part, to the examination for the membership to be established by the society. It was also resolved that on and after November 1st next the entrance fee for membership be two guineas instead of one guinea as at present. At the close of the special meeting an ordinary meeting was held, and Mr. Henry Lovegrove, F.R.I.B.A., read a most interesting paper on "Housing the People in London and the Provinces."

Liverpool Engineering Society.—A meeting of this society was held in the Royal Institution, Colquitt Street, on Wednesday last. Professor Hele-Shaw presided, and there was a large attendance. The principal item of the evening's proceedings was an adjourned discussion on the paper read at the previous meeting, as the joint production of Mr. F. G. Baily and Dr. C. A. Kohn, on "A Scheme for the Distribution of Energy in Towns." Mr. Arthur J. Maginnes, who has been filling the position of senior vice-president, was nominated for the position of president.

Manchester Society of Architects.—The annual meeting of this society was held at the house of the Literary and Philosophical Society, George Street, the president (Mr. John Holden) in the chair. After the annual report had been adopted the following members were elected as Officers and Council for the coming session:—President, Mr. John Holden; Vice Presidents, Mr. John Ely and Mr. R. Knill-Freeman; Hon. Secretary, Mr. Paul Ogden; Assistant Hon. Secretary, Mr. Edward Hewitt; Members of Council, Messrs. R. I. Bennett, A. H. Davies-Colley, T. Chadwick, R. Knill-Freeman, F. Mee, J. D. Mould, W. A. Royle, E. Salomons, J. H. Woodhouse, and T. Worthington; Members of Council-associates, Messrs. J. S. Hodgson, H. E. Stelfox, and P. S. Worthington; Auditors, J. W. Beaumont and C. H. Heathcote; Education in Architecture Committee, Messrs. A. H. Davies-Colley, John Ely, F. Mee, J. D. Mould, G. H. Willoughby, J. H. Woodhouse, P. E. Barker, G. Brown, T. Hesketh, J. S. Hodgson, H. E. Stelfox, and P. S. Worthington. Mr. C. R. Locke, Mr. Joseph Nodal, and Mr. Joseph Swarbrick were elected Fellows, and Mr. C. D. Rochester and Mr. F. J. Almond were elected Associates of this Society.

The Institution of Civil Engineers.—The ordinary meetings during the present session will not be held, owing to rebuilding of the premises. The special meeting on Thursday and the annual general meeting on May 28th will take place at the Royal United Service Institution.

THE Duchess of Teck visited Malvern on Wednesday, and opened the new waterworks, which have been constructed at a cost of £60,000.

It is proposed to build a new Church of England Church in place of Christ Church, North Brixton.

THE once-famous Shelley's Theatre in Tite Street, Chelsea, is about to be demolished, and the freehold site to be brought under the hammer at the Auction Mart, early in May.

DR. ORSI has discovered, after long excavations, in the island of Pantelleria, a prehistoric village of the Stone Age. Of special importance are the fortifications, consisting of a colossal wall, or agger, made of stones roughly heaped together. He has also found some strange buildings, which he believes to be dome-shaped pre-historic tombs, belonging to the necropolis of the primitive inhabitants of Mursia.

£20,000 is needed for the extension of the handsome building of the Jew's Hospital and Orphan Asylum, of which at West Norwood, Mr. Alderman Faudel Phillips is the President, so as to accommodate 100 more orphans. In 1876, when the Jew's Hospital was amalgamated with the Jew's Orphan Asylum, there were only 155 children in the two institutions. In 1895, the number is 277, which far exceeds the maximum the present building can accommodate.

The Builders' Journal COMPETITIONS.

No. 2.—A Village Club House.

The Proprietors of the BUILDERS' JOURNAL invite drawings, in competition, from those under twenty-six years of age, for a Village Club House, on a corner site, 150 feet by 40 feet. The Club to contain a general room with a dais for the villagers, a reading room and library, a bowling alley, service bar, tea room, committee room, housekeeper's apartments, and three cubicles for public use. The necessary outbuildings must be provided. Cost not to exceed £2,000. Drawings to be delivered at Talbot House, Arundel Street, Strand, not later than Monday, the 6th May, 1895.

RULES.

- 1.—There must not be more than three separate sheets of drawings submitted by any competitor in any single competition.
- 2.—The scale must be a uniform one of 8 feet to the inch for plans, elevations, and sections. Detail drawings must be to half-inch scale, and a perspective in ink may be included.
- 3.—All drawings must be inked in, and be without colour or wash.
